He died to serve his country—not a single man did more.

Woman and the Home

Training the Other Woman's Child.

They all sat round in friendly chat
Discussing mostly this and that,
And a hat.

Until a neighbor's wayward lad
Was seen to act in ways quite bad;
Oh, 'twas sad!

One thought she knew what must be done
With every child beneath the sun—
She had none.

And ere her yarn had been quite spun
Another's theories were begun—
She had one.

The third was not so sure she knew,
But thus and so she thought she'd do—
She had two.

The next one added, "Let me see;
These things work out so differently."
She had three.

The fifth drew on her wisdom store
And said, "I'd have to think it o'er."
She had four.

And then one sighed, "I don't contrive
Fixt rules for boys, they're too alive."
She had five.

"I know it leaves one in a fix,
This straightening of crooked sticks."
She had six.
And one declared, "There's no rule giv'n,
But do your best and trust to heav'n!"
She had sev'n.
—Alice Crowell Hoffman, in The Woman's Home Companion.

Her Biscuits.

A lot of folks had come to dine,
Offers of help she did decline.
She thought she knew a great big lot,
And went to make some biscuits hot
She measured carefully cup on cup,
And deftly mixed ingredients up,
But when quite done they were as hard,
As any pebble on the sward,
Or any rock upon the beach,
And yet our New-wed had her speech,
And coolly stated with a smile,
(Her dimples rippling all the while)
"I merely just forgot the stuff,
They use to make the mean things puff!"
And so, forsooth we all agreed,
She made a gracious mistress freed,
Form every sort of irking blame,
For any cooks had been the same,
If she'd left out the lightning stuff,
That goes to make all biscuits puff.
—Rose Seelye-Miller.

"Have an Apple."

[Dedicated to Editor of THE R. N.-Y. in appreciation of his expression, "Have an apple."]

Most all of us, like peaches, pears, or cherries,
Or plums, or figs, or dates; or some like berries;
But the best of all to eat
Having choice from sour to sweet
Is an apple—*"Have an apple"*
It will make your day complete.

When Smith, or Jones, or Brown, or Dusenberry
Says, "Come boys, have a smile, let's all be merry."
Be prepared to do this act
Using courtesy and tact
With the apple—*"Have an apple."*
It will please them for a fact.

When Mary Jane cooks goodies for her Billie
And her little folks, John Hennery and Tillie,
Nothing gets their taste or eye
More than dumpling or a pie
Made of apple—*"Have an apple."*
And another bye and bye.

When walking through the streets you want some pleasure,
The kind of pleasure you will surely treasure.
To some hungry looking boy
Pass an apple. Note the joy
On his face—*"Have an apple."*
Will not injure or annoy.

That apples are king though of all fruits that grow,
We all of us—everyone—surely must know;
For the greatest temptation
That befell our relation
Was when Eve said, *"Have an apple."*
Adam fell—expiation.

That the slogan is old you need not be told.
Now all who belong to THE R. N.-Y. fold
Cordially are invited
To all make a united
Apple cry—*"Have an apple"*;
And we'll all be "de-e-light-ed."
O.

MOTHER'S ROOM! There ought to be such a room in every farmhouse. Not a sleeping-room, but a place set apart for the women of the family to have for their own. The head of a business must have his office where he can be alone if need be. Mother is the head of the house, and she should have her room fitted to suit herself. We have found a farm woman who has fitted up just such a room. She calls it her sewing-room. It is really home headquarters, and we are to have a full description of it.

* * *

WE are talking seriously of buying a small auto in partnership with our best friends. Father would take care of it; they have a place to keep it. Both families are honest and of very moderate means. We can get a small, new, reliable car for $395. It is lightweight and not at all fancy: for instance, in place of the running-board it has a step like a buggy. I wonder if

DO you realize how the Rural family is scattered over the country? While most of you are working with coats off and in the midst of grass and flowers, others are still in the snow. The little picture shows what some of the children of our big family are doing right now—far up in Canada. By way of contrast we could show you other Rural children on the Canal Zone who run about in the sun—and never saw ice or snow.

people ever did buy an auto in partnership, and what terms of agreement they entered into? E.

Our folks have tried about every sort of partnership or combination, and they can tell. To make a success of such a combination we should think the sparker between the two families should be dull and slow to act. Family explosions do not drive the car steadily, but blow up the connections. It will work best where there are no children in either family.

* * *

WE have in our community a White Wyandotte hen that laid 93 eggs in that many consecutive days in her fourth year. Her owner values her at $100. She is named Pin Feather.
Michigan. P. L. W.

Why not call her "pin money"? In a few years she would enable her owner to buy diamond pins. Her daughters would be sought after far and wide. There may be such birds in many a farm flock—flowers that blush unseen and provide custards or fried eggs when the poultry world would chase after them if they were known. In last year's poultry contest at Storrs, Mrs. Haynes of Idaho entered six Wyandotte hens. They were carried on horseback and stage many miles before the express company could start them on a 3,000-mile journey. Yet these birds from the back mountains beat all the other Wyandottes in the show.

* * *

THE *Women's Journal* tells the story of how Colorado women influenced the Governor to put an end to civil war in their State:

"They issued a call in the name of the womanhood of their State for a meeting at the Capitol. One thousand of them, with the cries of the slaughtered in their ears and aghast at the horror of ruthless State murder of their fellow citizens, marched to the Capitol and demanded an audience with the Governor. He refused to see them. They stood firm and repeated their demand. The Governor hesitated; he did not want to see them; but they were voters; besides, there was something awe-inspiring in their spirit and numbers; they meant business. The Governor reluctantly admitted them."

These women, once admitted, stayed there until they saw a message calling for Federal aid filed. Most of these women went on duty at 10 o'clock in the forenoon, and at 10 o'clock at night 150 still remained in the Governor's office, not leaving until he had surrendered. "Votes for women" has no more determined opponent than the New York *Sun*, yet this exhibition on the part of these Colorado women compells that paper to say:

"We hope these determined women, who did a necessary job so thoroughly and well, will now see to it that the administration of their State does not fall into laxity and inefficiency again. They have shown that they can compel action in a crisis; let them now take counsel to prevent such a crisis from again arising.

* * *

WILL you please write something emphatic and persuasive on the desirability of men folks coming to meals on time when they can? So many farm women lose valuable time waiting unnecessarily. Last night the best father in the world was at the house when the water was put on to boil for tea. It takes 10 minutes; he knows it. But he wandered off to plant three short rows of potatoes, then conversed with the neighbor over the wire fence, and turned up half an hour late. On one farm, where the man of the house is especially bad about this, a wise young cook, in oil-stove weather, heats the blue-flame oven piping hot and sets it on the range, and is thus prepared with a place to keep food hot until the man deigns to appear. K.

"Emphatic" is well enough, but with a well-trained man "persuasive" should not be necessary. Who trains the man into this habit? Does *he* ever have to wait for the women folks to get ready? Try a cold meal on him for once and see how it works.

* * *

THE Ohio Agricultural College states that Sharon Center, Ohio, is the smallest town in that State having a system of waterworks. From the side of a hill well above the general level of the village, a strong spring flows from the sandstone rock. The stream from this spring fills a four-inch pipe, and the flow does not vary perceptibly with the change of seasons. A large cement tank holding 900 barrels has been built farther up on the summit of the hill. A hydraulic ram has been set a little below the outlet of the spring. From this water is forced into the tank. A service pipe leads from the tank to the town almost a mile away. This water, coming as it does from the sandstone rock, is pure, and has the added advantage of being soft. There are many farms in Ohio where it would be possible to install a hydraulic ram and service pipes to supply the house and barn with an abundant supply of fresh pure water. In many cases there is a nearby hill, high enough above the house, where a cement storage tank could be located, thus insuring a constant supply safe from frost.

Advice to Young Writers.

I WAS much interested in the talk about writing, on page 670. You are, in this, doing a great service to the hundreds of young men and women who think there is big money in writing for the press, and yet have nothing to say worth either writing or reading. Only a few days ago a young man came to me with a story for criticism, saying that even his wife did not seem able to understand it! I told him that I did not understand it either, and suggested that he send it to some magazine, mentioning two or three. He said he was afraid to do it, for fear they would steal it, dress it up in their own way, and thus deprive him of the rewards of his labor. I told him that might happen once in a very, very long while, but did not think there was much danger of it. He then wanted me to hand it to my oldest son and get his opinion, which might be better than mine. He went over the same story with my son, and when he told him there was nothing in it, he said: "Then writers are simply at the mercy of the editors." "Certainly. The seller is always at the mercy of the buyer. Those clothing people down the street are at your mercy. If they don't offer you the clothes you want, you don't buy them; that's all," my son replied. "What shall I do?" he asked. "What are you doing now?" "Clerking in a store." H. C. then said: "Write a story about clerking. There's any amount of story material going to waste every day, if men only knew how to write it up."

You are about right in saying that 75 per cent. of the people think in monosyllables. I have been amusing myself for some time past in figuring out the per cent. of polysyllables in articles, from whatever source, that appeal to me. I find they run from 20 to 25 per cent.; and it is only rarely I can stand to read one that runs much more than that. Another thing I have noticed is that the men whose writings appeal to me use mainly words of Anglo-Saxon derivation. Of course we can't get along with less than 10 per cent., or perhaps 15 per cent., of foreign words that have become rooted and grounded in our language. I find I cannot read with patience any man who uses 40 to 45 per cent. of big words. The fact is I don't read him long, but just quit. HENRY WALLACE.
Iowa.

Advertising for Teachers.

THE annual school meetings are held about May 5, and soon after that a cry will be heard that the rural trustees can't find teachers. Yet it is a fact that every year the so-called "normal" schools and training classes are turning out quantities of young men and women licensed to teach, but many of whom never afterward teach at all. When they come out, unless there is influence (chicanery) at work for them they are at sea. There is no opening for them unless they put a fee into the slot of a self-constituted teachers' agency and take their risk for taking out a State office. The fee used to be two dollars, but now is probably more, and a commission on the salary obtained. The State provides no way for bringing together the teacher and the school. Many get discouraged and turn to something else, although each normal graduate will have cost the State $900 or more, and the individual has given three or four years of young life, and expenses of self-support. There is occasionally one who is not willing to buy a State office. There are plenty of well-qualified persons to be obtained if the right and easy means are employed. Now, are you not desirous enough to help the schools to be willing to put in your paper a little piece of advice to trustees, somewhat like enclosed, and see how it works:

SCHOOL TRUSTEES, ATTENTION!

When in need of a teacher just put an advertisement like this in your local paper, and see how long before you have one:

WANTED—A teacher in District No. ....., Town of ....., County ....., State of .....
Address, ——— ———, Trustee,
Post Office .....,
State .....

I knew of one trustee who had been harassed for three months to find a teacher and put in an advertisement and had a teacher in 48 hours.
MARY E. SHEPARD.

SALICYLIC ACID IN CANNING.—The Agricultural Department says that enormous quantities of salicylic acid are sold in the South and Southwest for home canning. One grocer sold over 7,000 four-ounce packages. Still more of this and boric acid are sold under fancy names at a high price. The "directions" tell us to fill the jar with fruit or vegetables, cover with water and add a teaspoonful of the powder. This stuff may prevent decay of the fruit, but it means a nasty and dangerous food. The Department states: "Salicylic acid is a medicine of the greatest value in acute articular rheumatism and certain other diseases. It is well known as a poisonous substance, and one of the evils which may accompany its use is derangement of the digestion. It is therefore plain that its extensive use in food may lead to disturbance of digestion and health." The good old Methodist *hot* treatment is the safest and best way to preserve fruit or vegetables. Never, never use drugs or dope.

"Short Stories"

All Sorts of Personal Experience With Food, Friends and Fixtures

A WOMAN'S BANK.—Berlin, Germany, has a woman's bank (Frauenbank) with membership limited to women. It does a general banking business and furnishes legal advice regarding estates, taxes and investments for women. It has over 1,000 members. The shares have a nominal value of 100 marks ($23.80) and each shareholder carries a liability of 200 marks in addition to the cost of the share. Interest is paid, varying from 3½ per cent. with three weeks notice to five per cent. with a year's notice.

CLOVER TEA.—Some one asks for a substitute for tea. To the real tea or coffee lover there are no substitutes, but my daughters and I have taken comfort in clover tea. It is to be had, I think, at the drug stores, or was some years ago, when it had a vogue, but trying to make it of your own Red clover blooms has not been satisfactory to me. It is worth a trial. L. J. S.

THE TRAMP HEN.—In your notes concerning the tramp hen let me advise those so troubled to bore a hole in several grains of corn, tie eight inches of wrapping twine to each grain. On the other end tie a tag with some appropriate scriptural motto. The hen devours the corn and does not devour the tag, but carries a message to its heathen owner.
Norristown, Pa. G.

TAKING LODGERS.—For some of the village residents who would like a little money, maybe this experience would suggest something. Coming out of the post office one day in our old home, a village of about two thousand inhabitants, the assistant postmaster introduced me to a lady who was looking for a room and did not want to go to the hotel, patronized mostly by commercial travellers. This lady was looking up ancestors for a would-be member of the D. A. R. Sister was away, so I took the stranger in on that and another visit. She gladly paid a good price and proved very good company. E. S.

BOARDING THE TEACHER.—Would this do for a common question: "What ails the teachers?" In a Connecticut village of somewhere about three thousand population, with up-to-date schools, five teachers are hesitating about signing their contracts until they are sure of having some place to live. One country school has been given up because there can be found no place for the teacher to board. The children are carried by barge to another district. Here teachers have been unable for years past to get board, have had to board four miles away, and come here by trolley. The reason assigned is that most people work in the mills and rise early. The teachers would have company nights and use the parlor and keep the piano going until midnight nearly every night, and the household was kept awake. The school superintendent is finding, where possible, teachers who live near the schools; he believes that solves the trouble and gives a better and more interested teacher. K.

A WOMAN'S 35-CENT DOLLAR.—We are old subscribers to your paper. It is the best of the many farm papers we get. I am interested in your talks on the farmer's 35-cent dollar, and want to tell you of an experience I had last week. I have about 40 pounds of beeswax which I want to sell. I called by telephone a wholesale druggist in Bradford, our nearest city, and asked the price of beeswax. "Fifty cents per pound. How much do you want?" he said. I answered, "None, but I have some to sell. What will you give me for it?" Twenty-eight cents was his answer. I then called another druggist who was selling it for 60 cents, but would only give me 25 cents. And he put in the proviso that it must be pure beeswax. I didn't know you could make any other kind. At any rate I still have my beeswax. Wish some of the farm women would tell through your paper how they extract the wax from the comb. I find it a tedious job and well forth 50 cents per pound to do. J. A. G.

ADOPTED CHILDREN.—The paragraph on page 1304 with reference to adopted children brings to my mind the experience of a friend of my boyhood days. This man was a good farmer who was blessed with a large family of good children. He gave them all a good chance to get an education, and all finished the course at the State Normal School, and I believe one or two went on through college. All found or made homes for themselves, and our friend and his wife were left alone on the farm. All this happened something like 15 years ago. Not long after the youngest daughter was married the father was surprised on his return from a short absence to find that while he had been away his wife had adopted a little girl about 12 years of age. This girl proved to be very helpful and agreeable, and after a short trial the old people adopted her legally. The next Summer the foster mother took the little girl with her when she made a visit of several weeks at her old home in the East. When she returned she found it was her turn to be surprised, for during her absence her husband had adopted a girl and a boy (a brother and sister who had been left homeless). When I last saw my old friend, two or three years ago, he told me that all three adopted children were doing well, and that both he and his wife were nearly as fond of them as they were of their own children.
J. M. DREW.

THE SHUT-IN.—If you want to help a shut-in or invalid do not make her the repository of all your troubles. Don't think that because she suffers she has a lot of sympathy to extend to you. In all probability she does have more sympathy for you, but the recital of your woes leaves her more or less depressed, especially as she thinks about them after you are gone. Therefore do leave her something cheery to turn over in her mind when she is alone. Having been more or less of an invalid for three years I speak from experience. If you can find that she is interested in any especial line remember her when you see items concerning it, and the little clippings mailed to her may do her much good, for they show your thought of her as well as help her on in her hobby. If possible show her the funny side of things. Cultivate the humorous view if you want to help others as well as yourself. C. B.
Vermont.

CARE OF THE PIANO.—A piano is almost as sensitive to heat and cold as an invalid. It should not be placed too near a fire, as the heat draws the wood. Neither should it be near an open window as on a wet day the dampness is apt to rust the keys and wires and take the polish off the case. Always keep the piano closed when it is not in use. The keys should be dusted frequently with an old silk handkerchief and rubbed occasionally with a cloth moistened with methylated spirits. If they get very yellow rub with a very little lemon juice and whiting, and remove it with a damp cloth. But be very careful that none of the dust falls between the keys. If the case gets clouded and dull looking, give it a good polish with a very little furniture polish and rub with a chamois leather. In towns it is apt to get smoky. To remove this wipe over with a cloth wrung out of vinegar and then polish. Don't put your piano close to the wall as it deadens the tone. To keep it in perfect order it should be tuned about every three months. A piano is never heard to the best advantage in a room that is overcrowded with furniture and hung with many draperies. MRS. J. J. O'C.

BURNING OUT CHIMNEYS.—I see in THE R. N.-Y. some inquiries about burning out chimneys. I wish you would warn all readers against such a foolish thing, it is very dangerous and wasteful. They are taking long chances on burning their property, also their neighbors, if there are any close by. Tell them to try the following, and report results. Remove pipe from stove ,and clean well, cover over top of chimney with boards, then take a revolver, and insert two or three blank cartridges; insert your hand into bottom hole in chimney and fire off the cartridges. The resulting concussion will bring down practically all the soot in chimney. Gather it all up and put in sack or barrel, and use it on your farm or garden. It is a most excellent fertilizer. If any of the readers don't happen to have a revolver borrow one from your neighbor, if he has one, if not go buy one, and while at it get as good a one as you can. It is a good thing to have handy, for such vermin as chicken thieves, skunks, tramps, etc. G. J.

R. N.-Y.—In New York State you might be called on to secure a permit or license before you fired into the chimney. "Shooting up the soot" is a good one anyway.

KEEPING SMOKED MEAT.—In our family the problem of keeping smoked meat is a very simple one. As soon as convenient, after smoking, we paint all smoked meat with whitewash, using simply lime and water of about the consistency of paint. Two coats of the whitewash is put on, letting the first coat dry before the second is applied. After the last coat is dry we wrap the meat carefully in paper sacks, flour sacks are good, and hang in the cellar or any convenient place until needed. We often keep the meat from Spring until late Fall, and have never lost any. It seems as fresh as when first smoked. Flies never bother it after whitewashing. This rule has been used in the family for many years, with entire success. L. S.

A HAIR RESTORER.—"Have you any faith in hair restorers?" asked Jack of his chum. "Do you really think that my hair would grow if I used some?" "O, I don't know," said Jim with a thought and a chuckle. "A hair restorer worked wonders with my brother Dick—I'll tell you about it. A cousin of ours paid us a visit. She was 'fat and 40,' but a big kid. She was tremendously interested in hair restorers. How she did pity the chap that was bald! Well, Dick told her that his hair was too fine to grow, so when she had returned to her home he received a bottle of the magic fluid. Soon after, he sent her his picture, and there was a remarkable change in his appearance, for he certainly had a luxuriant growth of hair. Now, Maggie, our cousin, had always wanted to go into the hair restorer business, and she felt so encouraged by this that she wrote to my brother and told him her plans. He was afraid that she would not succeed, so he wrote back and confessed that he had wanted, so much, to make her think that the hair restorer had done wonders, that he had had his picture taken with a wig on. She didn't go into the hair restorer business, but she married him. Now, you are a bachelor. Perhaps a hair restorer would have the same effect upon you as it had upon my brother Dick." But Jack gave him a push and said, "My hair might grow gray, then." J. C. MCB.

THE AGENT.—I'm no dressmaker and we have no canary, but we do have funny experiences sometimes. I wonder how many people realize what a nuisance the average peddler and agent can be to a busy housewife? I have no objection to that way of making a living if anyone likes it, but it isn't necessary to be disagreeable about it. One very hot day when I hadn't kept house very long one of our boys came in with his hair full of bees and a liberal supply of stings. I was baking bread and preparing dinner over a hot range, overheated and overbusy myself, the boy thoroughly terrified, and the moment a most inauspicious one for receiving calls, when a medicine agent arrived. He was carrying Dr. Somebody's "Specific Cure-all for All the Ills of Life," and insisted upon selling us some. As a matter of fact every member of our household—and there were a lot of us—was perfectly well except for those bee stings, and we told the gentleman that was our only affliction. He was sure, however, that we weren't strong, something must be wrong with us, our complexions indicated liver trouble and various ills, and we must require his medicine. I was too busy trying to relieve the boy to give very respectful attention, but the price was high at first and came done by leaps and bounds, while the would-be seller assured us that our everlasting-never-ending future depended entirely upon the judicious use of his specific. When I could get in a word myself I reminded him that we needed only a cure-all for stings, and if he hadn't that I feared that we could use nothing else. He still persisted in urging me to buy, telling me precisely how to take the stuff and adding, "And it would benefit your husband too." Even in the hurry and flurry of the moment a vision of my husband, who was a picture of health, made the situation appear irresistibly funny to us all and I couldn't resist the suggestion that if my taking the decoction would be a great benefit to my husband I might consider it. The man was almost too angry to speak and soon left, but by the time he reached the next neighbor his eloquence had returned and he was thoroughly insulting. Somehow it seemed to us that a tactful and observing man could have seen that he had struck a very inopportune time to advertise his goods.
M.

That Is My Property!

ON a recent Sunday there was a great disturbance in a fashionable New York church. A crowd of outsiders tried to interrupt the service, and were thrown out without gloves or ceremony. The police had hold of one man, and were prepared to give him what they called the "giant swing" when his wife rushed to his rescue and shouted:

"That Is My Property. I Do Not Want It Damaged!"

That is a new idea in property rights. In old times it was understood that the wife was the property of the husband. Perhaps the new times will see a reversal of this principle! We have seen women go out and get wood or water or do chores while husband, son or brother sat idly by the fire. Perhaps she regarded these great citizens as her property, and did not want them damaged! When she sets that form of human property at work carrying out her ideals in public life the world will be better and happier.

Women Can Manage Their Own Property

We know that from the last month's experience. The men folks, aided by the women, have made THE R. N.-Y. what it is by making it their mental property. Visitors tell us the paper is found on the desk of every important agricultural official and of every strong business man because they know it expresses the opinions and the sentiments of the great mass of working farmers.

Now we want this magazine department of Woman and Home, in like manner, to represent fairly and sincerely the opinions and desires of the farm women. It is the property of such women, and they can make it represent them just as the men have made THE R. N.-Y. such a power in public life. Since our April number appeared we have received

Over 400 Letters From Farm Women

discussing what had been printed or adding new experiences. Nothing could be finer or more hopeful than the way these sensible farm women come to help manage their property by suggestion or experience. We invite them to come and tell us their triumphs or their troubles. Every power that THE R. N.-Y. possesses is at your service. This department is your property. Tell us how you want it put at work.

We Want Boiled Down Human Nature

Which means that we want short, condensed articles and stories which deal with true human experience.

BRIGHT DIALOGUES. We can use a number of short dialogues or conversations between two or more people. They should not be over 300 words long. They may be real or imaginary, and may cover any subject from setting a hen to discussing a poem. Just tell us in a few words how two bright people would talk out the heart of some familiar subject.

STEP SAVERS. Tell us how you manage to get your work done in an orderly way with least labor. Suppose you had to go the rest of the way through life on a crutch and *had to keep going*. How would you do it?

SEND US ANYTHING you may think of out of your own experience or observation. We probably cannot print it unless it is short, true, good-natured, useful and of general interest. Do not hesitate to tell us just what you have in mind. That is the way to manage your property.

A Woman's Co-operative Store

Ten Country Women and Two From Town

By Helen I. Castella

IT was the school teacher who started it the afternoon the mite meeting met at Mrs. Mays, where she had been boarding, to get what she called "the rasp" off her nerves They had sampled Mrs. Lumley's plum cake and Mrs. Bonivard's doughnuts. Their appetites had been satiated (if one might use such a word in connection with eatables that fairly melted in one's mouth) with Mrs. Proctor's marmalade and Johanna Curie's trifles. A delicious yellow layer-cake, with walnut filling fairly oozing from its cracks, stood out upon the table, while with no thought or connivance at color scheme, the green of the pickles, the yellow and white of the deviled eggs, and the pink of the freshly boiled tongue made a sight that fairly created an appetite if one had been foolish enough to come to the table without it.

"My, but you women are foolish!" Some of the sharp edge had gotten from the school-teacher's nerves into her voice during the years of close confinement and endeavor to keep up with a constantly changing and experimental curriculum. "Every one of you has the making of pin-money right to hand, for each of you prides herself on what you call your 'specialty,' but you just eat and eat it up, over and over again. I don't believe one of you women ever earned a dollar in your lives!"

"I did—but 'twasn't on sweet potato pie—which I pride myself is my specialty. I taught school before I was married." Mrs. Bergman looked around the table and then at Nettie Middleton with a triumphant air. It was almost as though she had said, "And it's a pity you hadn't done likewise."

"Yes, it is!" The tired school-teacher had no hesitancy in agreeing with the plump matron's unspoken speech. "But you see, we teachers, once we get past the first bloom, are too tired when night comes, to fix up with the idea of catching any man. I'll bet you got your husband before you were 23, and I don't care—even if I was married—and could make things like you people, I declare if I'd be above making extra pin-money for myself."

"We're not above it!" the chorus was unanimous. "It's the other way round, Miss Middleton. We're beneath it. There isn't any way of selling what we make, unless 'twould be through the women's exchanges, and somehow, eatables are not practical to be sold that way. One or two of us have tried at Christmas time; but there are so many women nearer who can see just what sells best, an' what is needed—"

"Why don't you coöperate?" said Nettie Middleton, sharply; "form yourselves into a body of women, pledged to stick by each other, and make an outlet for what you know will sell, once people have tasted it, from its very deliciousness? What you want is to make a business for yourselves—not to rely on somebody else's business already established."

"But, you see, Miss Middleton, each of us is a home woman. We don't know anything about business—we're all tied down with families. Of course none of us could leave home, but maybe we could get together in some way if we had somebody to tell us."

"I'm trying to tell you—but I'm used to explaining things on a blackboard. Suppose we'd take it this way, and say we'd form ourselves into a coöperative club, and we'd have dues of—well—say two dollars a month, apiece. Now don't all gasp"—as several "ohs!" and general exclamations of dismay were heard, "try and bear in mind that it's business we're discussing, and not a purely social affair where you meet to talk over fancy work and gossip. The two-dollar assessment would give us an income, if there were twelve of us (Reba and myself included) of $24 a month to meet expenses of a small, neat shop right in the residential part of the nearest city. There'd be two of us to run the shop, and 10 of you to keep it supplied with the stuff to sell. Each of you would have two basket hampers, and these would be constantly going, full from you to the shop, and empty from the shop to you. The parcel post would, of course, be the manner of transportation. You would send whatever you could spare, and all that you could spare, every day, every other day, or at least twice a week, keeping a careful account of all actual money expended, such as sugar, spices, and so forth, but having the agreement between us all that time is to be given free. No one is to charge anything for the actual labor. Now, to make this clearer, suppose I give you an illustration.

"Mrs. Bonivard makes these doughnuts. We'll imagine that we're selling on an average of 10 dozen doughnuts a day, at 12 cents a dozen. That would net us $1.20, and probably the cost of the material used for that amount would not exceed 20 cents. That 20 cents would belong to Mrs. Bonivard, the one dollar going into our capital (not our expense fund); the capital, being all profit, would be our remuneration for labor. Now Mrs. Bonivard would probably be supplying the shop with something besides doughnuts, which we would reckon on the same ratio. Putting each of you down for a profit of $2 a day would give us at the end of the week $120 dollars, divided among 12 people, $10 dollars a week apiece. Naturally this wouldn't be a fixed amount—it would largely vary by what was sent in and sold; but with two people to keep you posted all the time as to what there was a demand for—it does seem as though—" she paused, pencil in the air, a dreamy look in her tired blue eyes.

"And the store would be all ours, wouldn't it?" It was Mrs. Bonivard who broke the silence, perhaps because the doughnut idea had taken hold of her with intensity, "I mean, would belong to all of us, so's we could all have a say."

"Exactly. We'd be business partners. In the first place, we would all have a hand in furnishing it with something from our own homes to give it an individuality to stand on. Of course we'd have to get a showcase—maybe second-hand; but wouldn't it be nice to have all the china in the window alike?"

"Grandmother's old blue set!" interrupted Mrs. Mays, estatically, "the very thing! There's nothing like those platters for a walnut cake, and gingerbread cookies with raisins in 'em piled up on one of them plates 'll fairly make your mouth water!"

"We'd need curtains, wouldn't we, Miss Middleton?" Neither Johanna Curie nor any of the other ladies saw anything funny in thinking of curtains at this time. "I've been wonderin' all Summer what use I was goin' to make of that heavy lace I've been workin' on. I can see them now—cream color homespun, edged with the lace, on a brass rod, clear across the window. It'll be swell!"

"I vote, if Miss Middleton's willing to see us through what she's proposed, that we make her treasurer of the organization," and although at first the school-teacher's hands went up in protest, in the end she yielded, for it was through hers and her sister's hands that the money would pass anyway.

"Let us understand, though, that no one is working under anyone else. If, for any reason one of us wishes to withdraw, we can do so by paying our monthly dues for the current month, and receiving from the capital all money coming to you from an equal division of the cash on hand. Certain months some of you may contribute a great many more things than the others, and again, the next month, it may be just the other way around. Bnt I know our sales will show at the end of the month a pretty fair division, especially if we each view the place with a proprietory interest, realizing that it is going to add not only cents, but dollars to our income."

The little shop is now in its third year. To its surprise, almost from the first, it was spoken of in the neighborhood as "the delicatessen," although it had entertained no such aspirations. But Nettie's sister, Reba, confessed that all her life she had a hankering to make salads, and from her modest bowl of potato salad, set temptingly in the window, there have evolved chicken, crab and Waldorf, each having its particular day in the week.

Nettie, always considered the business manager of the firm, has been besieged many times to take on new members, all women anxious to add to their income by placing homemade products on sale, but after consultation wtih the others, she still refuses. Were the contributors greater in number, the shop might lose the delightful reputation it has for things that are "just right." Not one of the 10 countrywomen would dream of putting into a hamper a scorched or soggy cake, or jelly composed of anything but pure fruit juice and sugar. Mrs. Nickleson's roast chickens, arriving on Friday night, are browned to a turn, and have solved the problem of many a Sunday night supper, as have also the appetizing pans of pork and baked beans and the Boston brown bread on Saturday nights.

And Mrs. Mays no longer wrinkles up her forehead when the twins hang around Dad and tease to know whether he thinks he can send them to college. Because she knows that if Dad cannot, she can.

Advertisements For Farm Women

IN the last magazine number of Woman and Home we offered three free advertisements for homemade articles offered by farm women. The object of this was to show the possibilities for business in our Subscribers' Exchange Department. So many women applied that we found it difficult to make selections. After considering all carefully we decided to insert four instead of three advertisements for the following named women:

Miss Amy A. Harwood, Dorset, Vt.
Mrs. Wm. H. Atkins, New Paltz, N. Y.
Mrs. C. J. Gilbert, Cranesville, Pa.
Mrs. W. A. Smith, Clarkson, N. Y.

This seems as fair a selection as we can make. The advertisements will be found in the *Subscribers' Exchange* on page 787. This department was established for the special purpose of giving smaller advertisers a chance to announce their goods at little cost, and in a place where such announcements would surely be noticed. Advertising is a fair and necessary part of all business.

Printer's Ink in Some Form Must Be Used if we would attract the attention of buyers outside of our own neighborhood. We find after careful investigation that THE R. N.-Y. is read each week by over half a million readers—all of whom have desires to gratify and more or less money to satisfy such desires. Right here then, in our own big family, lies a business opportunity for you if you have some article which represents a fair bargain. We print these four advertisements as an experiment to show our readers the possibilities of home direct trade.

Business Canning for Neighborhood.

ABOUT eight years ago Mr. and Mrs. Cornelius Canfield, of Cattaraugus County, N. Y., began canning their surplus from field and garden, using tin cans and doing the cooking on a cook-stove, and the same year put up a few dozen cans for neighbors. Mr. Canfield and wife had worked in a canning factory and understood the work. They had so many calls for canning that they soon bought a canner, and having built a new house, they utilized their old one for canning. After the second or third year they began canning beef, and their meat canning now exceeds all else. Within the past year they have canned 2,102 cans of vegetables and cereals, 7,968 meat (custom work), some fruit; also chickens and rabbits that are not reckoned. Their custom work is greatly appreciated, as in all the hundreds of cans we have used we never found a poor one, nor, to our knowledge, has anyone of beef; a very few of beans once spoiled.

Their meat canning this year lasted till May, they canning 15 quarters of beef the last week in April. Of their own products, they canned 953 of meat and 1,728 other things within the last year. Mr. and Mrs. Canfield, with the help of one other in hurrying seasons, do this work as well as the work on a small farm and housework. Their prices for custom work are as follows: Corn, 75 cents a dozen; peas and beans (shelled and cut), 65 cents a dozen; beef on the bone, 75 cents a dozen; cut from bone, 65 cents; pork and ham, 65 cents a dozen. Prices of their own goods: Beef, $3.60 a dozen; corn, $1.30; beans, $1.40; tomatoes, $1.40. It will be seen that within a year they have canned 12,751 cans, besides some things that were not reckoned. They do not tell their formula for canning, but they cook meat five hours; other things longer than where steam heat does the cooking. They use wood for fuel, and in hurrying times often have to cook all night to keep up and keep things from spoiling; but they seem to be satisfied with their work, and make enough so that they continue in spite of the hard work. They ship the bones to Buffalo for 60 cents a hundredweight, but we think a good bone cutter would pay them, or their neighbors, and have the bones kept nearer home. They have calls for their canning from distant States as well as the home towns, and people bring their meat from miles around. When we raise our meat and have it canned at Canfield's we know what we are eating, and we also know where to take any surplus garden stuff, including pumpkins, squashes, as well as the other things mentioned. E. A. B.

A Hopeful Illinois Woman.

ON page 637 Mrs. E. S. writes, asking about candy making. I know a woman, about 10 miles from here, who has made candy for years for her sole support, and now at the present time she is helping to support her son's family of eight children, her son having died. She makes up about four tons of sugar every Winter, and her machinery consists of a laundry stove and two brass kettles, in which she can make 20 pounds of candy each, and a marble-top table to cut the candy on. She makes a kind of peppermint candy. Mrs. E. S. can do whatever she likes to do—do her very best at it, stick to it, and she will succeed. I have tried a number of things myself, and I can make the most the year around selling milk. I try to supply my list of customers, and if I get short of milk I buy. I live on a farm, and have been boss and manager for almost 14 years (as I have been a widow that long), and now am getting to the place which is called pleasant living—that is, where I can get all the necessaries and some small luxuries. I am satisfied on the farm, and am thankful that I live in Illinois, and also that we, women of Illinois, can vote. I like THE R. N.-Y., which I have read for more than 20 years. MRS. A. W.

Keeping Summer Boarders

How Farm Women Do It

The Boarder as a Crop Consumer.

WHEN I read in the "Woman and Home" department of THE R. N.-Y. about experienced information wanted, and glanced on down to see that Summer boarders were one of the items mentioned, I remarked to my mother, who is my partner, that our information was certainly experienced, whether valuable or not. We have kept Summer boarders for 15 years, and have been intimately acquainted with every phase of the business. That we have not yet retired means that we do not make a fortune, but with no extra equipment other than an old-fashioned 11-roomed house, comfortably but plainly furnished, and a large, shady yard on a 15-acre fruit farm in Southern Michigan, we make from $200 to $300 extra each season.

We consider ourselves successful because our boarders say they enjoy our home and cooking, and return year after year, and we find it profitable when other neighbors, who charge more, cannot make it pay. We cater to city people, who want a quiet, restful place, and receive $7 per week. We find that they want just what we like—plenty of fresh fruit, vegetables, milk and eggs, and we make a specialty of them. We do not have a large variety at any meal, but an abundance of each fruit in season at every meal, and vegetables at dinner and supper.

I believe the secret of our success is good management. We never let anything go to waste, and plan our meals so that we can utilize what is left from dinner for supper. The meat from dinner makes croquettes or a souffle for supper; only occasionally is it cut cold, for that is the most expensive though the easiest way. Mother's specialties in cooking are croquettes, waffles, bread and pies, for which she is always sure of a compliment from new boarders. It is surprising how little baking most city people do, and waffles for breakfast, homemade breads and fruit pies for dinner, and little extra dishes for supper, which require more time than cost, are always enjoyed. I try to have the dining-table look neat and attractive, with flowers and pretty dishes. And parsley—we couldn't get along without that, for, like charity, it covers up a lot of mistakes and makes many a dish look tempting that would otherwise be passed by.

We work hard during the season; Monday and Tuesday morning we frequently have the washing and ironing done before breakfast. Other mornings we gather the vegetables and fruit to be used, or hoe in the garden; there is always plenty to be done. But we manage to get through by dinner time, and in the afternoon we rest awhile.

We agree heartily with the "Hope Farm Man" when he advocates keeping the home grounds beautified. There is no better advertisement for a farm than a pretty yard, aside from the pleasure it gives the owner for seven months in the year. We are fortunate in having fine, hard maple trees for shade. Along the south side of the yard we have a flower border nine feet wide that runs the length of the yard, 150 feet. In it we have Spring bulbs and perennials of all kinds, that bloom from March until November. We are never without flowers in bloom, and with very little work, for the plants are close together with little chance for grass or weeds to spring up. Around the porches we have vines, and some shrubbery in the yard. People always like to look around our yard. It is kept clean, back as well as front, and fenced against chickens of our own and our neighbors. Flowers surely do attract boarders. In August there is always a group around the evening primroses and moon-flowers watching them "pop" open.

Many wonder how two small people can do so much—plant a large garden and tend it, care for so many flowers and the yard, work with fruit, raise chickens, keep Summer boarders and hire no help. I notice among my neighbors a great difference in the way they manage their work. Some are never through, and yet accomplish little. There isn't so much in working hard as working to advantage; doing the right thing at the right time and not always be behind with the work.

We have not yet solved the farm problem of marketing our fruit. We can raise it, but very often cannot sell it, so that we can even have 35 cents of the consumer's dollar; but if we can keep from eight to ten boarders, and feed them our vegetables, surplus fruit, chickens and eggs, it is the most profitable market we can take them to, and nets us for our labor a fair profit. M.

Michigan.

The Boarders' Requirements.

SUMMER boarders, especially if they come from the city, come to your home, usually during the months of July and August, for a rest, and that means a change of food, people, surroundings—in fact, a change in everything, and see to it they are not disappointed. We raise all of our own vegetables and have all the milk we want to use. We also have hens, ducks, Belgian hares, and once in awhile the good man of the house furnishes fish, as we live right in sight of a large river. These with the other meats bought from the market insure no lack of variety. If possible serve no vegetables bought at the grocery, put up in tin cans, nor food bought at the bakery, and don't feed them on baker's bread, for they have that at home the whole year round.

Perhaps your family want breakfast at six o'clock. Serve this first, and have the first meal for your guests at eight o'clock, for they would much rather *hear* you tell about the beautiful sights and sounds of the rising sun and singing birds than to be obliged to rise from their beds to realize it themselves. For breakfast we have griddle cakes and maple syrup, eggs, potatoes in some form, coffee or cocoa, and plenty of good milk. This last is on the table at every meal, a large pitcher full, so if they care for more than one glass they can have it. Don't make the mistake of serving the heaviest meal at noon, but instead a sort of luncheon, consisting of bread and butter, a salad of some kind, radishes, lettuce and fruit, or any light food at one o'clock. The evening meal or dinner is ready at six o'clock, with meat, potatoes, two kinds of vegetables, coffee, and for dessert one kind of pie or pudding, and quite often ice cream, bread and butter and jelly, fruit of some kind, either currants, raspberries, strawberries or apples.

See to it that your table presents a tidy appearance, and do have a clean butter plate, a good tablecloth and napkins, and shining glass and silver. No matter how many flies there are elsewhere, keep them from your eating-room.

Keep a strict account of everything you buy, and at the end of the week, when each pays his bill, you will find you are making good wages; at least, in my 18 years' exprience it has paid well. Last year the board was $7.50 per week; children half price.

At first advertise in some city daily, and after that the boarders themselves are, or ought to be, the best advertisement.

In regard to the sleeping-rooms—give them plenty of light and air, and make them look cool; it matters not whether there are carpets on the floor or not, for a good coat of paint or matting looks equally as well and looks much cooler. Muslin or cheesecloth for curtains, springs and mattresses, and a good supply of light bedding, and some plain furniture is good enough, for they will remain outdoors most of the time, when not sleeping and eating.

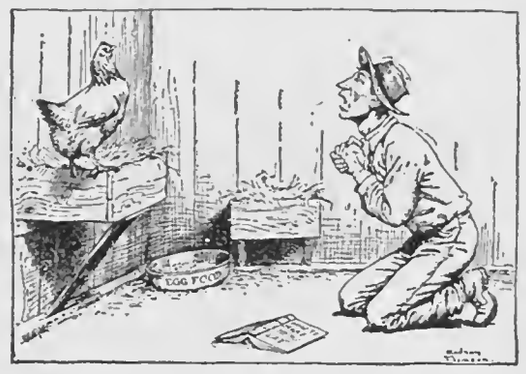
Take your team and go to some grove for an all-day's picnic, not forgetting the well-filled lunch-basket, and they will enjoy the change as well as you, and with lawn tennis, croquet, fishing, boating and bathing they will not lack for amusement. With us our greatest problem is to secure help in the kitchen, but since we have done what we could, and let the rest go undone, we have got along better.

There are so few kinds of work a farmer's wife can do to earn money that I often wonder more do not take some guests from the city, for every season we turn away more than we entertain.

Chenango Co., N. Y. E. N. SMITH.

LAY THE JANUARY EGG NOW.

NO, the picture here given does not represent the Hope Farm man begging his scrub hens to improve a little upon their egg yield. They are doing that now without any such appeal, and the gentleman down on his knees in that henhouse does not look at all like the Hope Farm man. Nor does this represent Tom Barron, the great English breeder; or Geo. A. Cosgrove, or Dr. Dean, or any of the other known poultry experts, trying a new trick on the hen. We know a woman who hung a copy of "The Business Hen" in her henhouse, and claimed that within a few days the egg yield nearly doubled; but this hen looks as though she cared very little for literature. This picture represents the dream of a city artist, as printed in *Collier's*. The man who is responsible for this thinks he has given an excellent representation of the good old farmer and one of the prize hens at the egg contest. He is in blissful ignorance of the fact that what he has really pictured is an escaped lunatic, with a Brahma hen who has retained the plumage of her



breed, the shape of a duck, and the independence of a bantam rooster. Underneath this picture we find the following printed:

"*The farmer has to borrow money when interest is highest. His hens always stop laying when eggs are highest.*"

The new land bank is going to take care of this interest proposition, and as for the hens, the intelligent farmer now knows that if he wants an omelet or a custard in January, it isn't necessary for him to get down on his knees in the henhouse when the hen refuses to lay. Far better go to the jar of water-glass, take out a few good specimens, and dream of Summer while you eat the custard pie. Just now eggs are rolling into the house, so that they seem to be a nuisance. Next January the nuisance would lie in the fact that the hens have gone on a strike. Then you will find the jar of water-glass a strike breaker. True, the hen might not recognize her own egg in January, and she could not hatch it out even with six weeks of incubation, but it's an egg all the same, capable of taking its place in pie, cake or pudding. So get up off your knees and stop wringing your hands. Go and buy some water-glass. Put the kettle on the stove and boil some water. Put one pound of the water-glass into nine pounds of this boiled water, and pour the whole thing into a wood bucket or stone jar. Then go out to the henhouse and get some eggs as close to the hen as you can find them. By close to the hen we don't mean an egg that has been close to a sitting hen for three or four days, but one that is only about an hour old. Wash these eggs off clean, put them down into that water-glass, put on a cover to keep them down in the liquid, put the whole thing away in a cool dark place, and go to business. The hen will stop her laying all in good time. Next Winter you will not be obliged to go in such a humble attitude as we see this man pictured. The hen may lay, or not, for all you care, so far as your dinner is concerned. Take her eggs out of that water-glass bucket, and the chances are 10 to one that this old hen, like the great majority of other ladies, when she finds that she is no longer boss of the situation, will get right to work and attend to business.

Mrs. Dictate—"I am so glad I came to visit my son's wife. I can teach her so much. You see, I am boiling these clothes. You can't convince *me* there's any soap will make clothes white without boiling."

Anty Drudge—"If you have some more soiled clothes, I will convince you in just 30 minutes that you *can* get them clean and white without boiling or hard rubbing. I know what Fels-Naptha will do, and you're just the kind of woman I like to meet."

Be sure to buy Fels-Naptha the next time you need soap. It will make *all* your work easy and pleasant.

One of the *best* things it will do for you is to get the weekly wash on the line in half the time, with less than half the bother than ever before.

Just soak the clothes about 30 minutes in cool or lukewarm water, rub lightly, rinse and hang out. No boiling or hard rubbing is necessary with Fels-Naptha. Makes cleaning, scrubbing and all kinds of housework just as easy.

Better buy it by the box or carton. Easy directions are on the Red and Green Wrapper.

Fels & Co., Philadelphia.

FELS-NAPTHA

THE HOME DRESSMAKER

Talks on Home-made Clothes

A GIRL'S SUMMER CLOTHES

A Plain Talk on Clothes.

CATALOGUE STYLES.—First let me urge you, no matter what fashion books you have, to get catalogues of the best stores. New York leads us in fashions, so try to have catalogues from two or three stores. "The fashion books show what may be worn, but the good store catalogues show what will be worn," said the best dressmaker I ever knew. Only avoid the cheap mail-order houses; they often give good value, but their garments lack the distinction in cut and line of those from more exclusive stores. I know a poor little country bride who made the garments in her trousseau at home most carefully from fashion papers and paper patterns. Only when she went to her city home scarcely one of the styles she had chosen was worn there; she felt dreadfully about it. Don't expect too much of your clothes; you can't look like the illustration of costume figured if you make it. Really, you don't want to, for many illustrators admit using an impossible type. Don't be afraid to dress your hair in the way you like if it is becoming, and if one general style of dress and hat should suit you best, keep on wearing it, changing only enough so you won't be noticeable.

SKIRTS AND BLOUSES.—A close study of fashion periodicals and catalogues has shown me but one waist with the old-fashioned high collar. Many have a collar just across the back, and the front is gathered on a cord and ties at the neck. Many have the corners of the fronts turned back at the neck like revers, with collar across the back. Some have elastic bands at the waist. All seem to be loose and slouchy. By the way, how important the corset is in the new "corsetless effect." Skirts seem to show a width of from 1 yard to 1¾. The skirt one yard wide is draped and open for some distance in the front. Some one who has been studying the subject says that a small person can just step in a skirt 54 inches wide. Does that mean that she could step across a mud-puddle or into an open car with ease? I know a little lady who once had a modish house-gown made, very scanty and clinging. It looked well until madame attempted to do something out at the barn; then things happened to the seams.

ODDS AND ENDS.—Silk underwear is especially comfortable under the narrow skirts. One Boston store catalogues full-length silk bloomers, reaching to the ankle. I wonder who wears them? Shoes are very noticeable with our present styles, as are hose. The latter should match the dress. Many shoes show the new "Konkave" heel, but I have seen several styles with a new, low, broad heel.

Minaret flounce distenders can be bought, opening to any distance up to two yards. They remind one of a hoop skirt not fully grown.

At the Easter church parade in Boston it was noticed that all bright colors had disappeared; only dark colors were seen. The skirts were noticeably short and scant.

Have any of you tried ripplette for morning wear? I thought it needed no ironing, but it does; only smoothing with a warm iron will do nicely.

Cravenette makes the most delightful skirts for rough and outing wear. It does not crush and wears for ages.

A New York catalogue shows a delightful beach or automobile bonnet of silk and fine straw, that would do as well for driving or would stay on in the open cars this Summer. It comes in various collars and is not expensive.

Tassels seem to be the latest in trimming, and appear on all sorts of things, in all sorts of places.

Anyone who is chilly will find a little gown of thin wool or cotton and wool made with V-neck and short sleeves very comfortable on chilly days. I am planning one of white poplar cloth with black lines. The sailor collar and cuffs will be inlaid with silk, and the girdle made like directions given in THE R. N.-Y. The skirt will be draped slightly and have three big smoked pearl buttons for decoration. The back of the waist will come over on the front to form a yoke, and the front will be draped to match the skirt. The hat to go with it is black hemp, with white crown and black ribbon bow standing up at the back. The bow catches the wind like a sail.

I fancy the reason some readymade frocks are so cheap this year is because it takes so little cloth to make them. I have seen wash-dresses for five dollars that would make a woman look well-dressed anywhere. A little bolero suit recently seen took only 3⅓ yards of 36-inch goods.

A novel jabot recently seen was laced together in the center with ribbons. I make my neckwear from designs in the catalogues, and find the materials in piece-bag and lace-box.

EDNA S. KNAPP.

A Dressmaker's Hints.

GENERAL DETAILS.—Dame Fashion, it seems to me, was never so kind to her votaries with lean pocketbooks as this year, for while the dresses require a little more material this year than last, they combine so many materials that all the old dresses can be made over, and where there are little women and men in the family, it is a small piece, indeed, of good cloth that cannot be utilized. To begin with the grown-ups' clothes first, there are a few general details to be observed which show the dress to be of this season's make; but aside from these there is a great diversity in the styles, and anyone can have what she likes. The skirts are somewhat fuller this season—in fact, full enough to be comfortable in walking, although they have the appearance in most cases of being as narrow as last year at the bottom, but they are all full at the top; that is, there are always some gathers at the top, and there is in most cases a bulging effect, beginning at and just a little below the largest part of the hips. The only exception to this is where one of the extremely long, full tunics is employed, this tunic being really a full skirt of three-quarter or seven-eighths length over a narrow underskirt, of contrasting material usually.

TUNICS AND RUFFLES.—Now this bulging effect at the hips is obtained in a great variety of ways, and incidentally they are the means or, rather, part of the means, by which you can make a "new" dress out of two old ones; or if the right materials are not on hand, by buying a yard or two of new material to combine with the old. There is the short, hip-length tunic similar to that worn last year, only it must ripple or flare at the lower edge. Then there is the skirt with two or three (depending on the height of the person) rather narrow ruffles, generally about seven inches wide, placed anywhere from three to five inches down from the waist-line. This, of course, is only suitable for soft material, and the skirt should be draped up in the back under the lower ruffle so as to give the desired narrow effect at the bottom. An allowance of several inches must be made from the sides to the back in the length of the skirt for this drapery. For the skirt of heavier material it is better to use circular ruffles, and these may be put on straight around or slightly higher in front than in the back or *vice versa*. Another type of ruffled skirt has the circular ruffles, beginning at the waist and continuing to just below the broad part of the hip, being from three to five in number. Sometimes these ruffles do not meet in front but start from under a graduated box-pleat. Still another skirt is the one with all flounces, three or more, but in every case the widest flounces are at the top.

PANIERS.—Then there are the skirts with paniers, and those that give the panier effect—puffs around the hips; and some of them have a bustle-like effect in the back. To make the ordinary panier or puff, if a regular pattern is not to be had, a pattern for one of the short tunics like those worn last year can be used by allowing extra fullness at the back and the front (where the goods is cut on the straight); also the hip seams should be slanted so as to give the greatest possible width to the bottom of the puff. It must be cut longer than the ordinary tunic so as to allow for the puffing out. The easiest way to finish the bottom is to put a narrow hem on the tunic and then run a cord through it, as it is easier to keep the gathers in the right place than if gathered in just the ordinary way. Sometimes these puffs are finished with a ruffle. While this may be made separately, and put on at the last, much the easier way is to allow the additional length of the ruffle on the tunic itself, and then either put a tuck in the material or sew a bias piece of some soft material where the top of the ruffle is to be and shirr on a cord.

THE NEW BUSTLE.—The bustle effect in the back can be obtained by making quite a full skirt and allowing extra length both at the top and bottom of the back breadth. Then start a little away from the side seams and gather the fullness of the back breadth until it makes the skirt the usual width, and tack it to the lining yoke of the skirt. The width of the puff will depend, of course, on the person who wears it, for, of course, a very thin person would look better in a very full puff, whereas a person at all inclined to stoutness should have a smaller puff. The depth of the puff to get the best results in effect is usually about a third of the length of the entire skirt, but this can be determined individually by trying on in front of a glass. However, to get the right effect the skirt must be draped up in the back so as to give the narrow effect at the bottom of the skirt. In fact, nearly all the skirts this year are draped up in the back in contrast to those of last year, which were draped up in front.

WAISTS AND SLEEVES.—Now as to the dominant note in waists and sleeves. All the waists open in front, and the majority have the V-shaped opening at the neck, although occasionally you see the rounding and the square effect in front. But they all have the flaring collar of some sort, which is loosely fitted to the neck—in fact, that loose effect must be given to the entire dress—there must be no look of tightness anywhere. The opening in the front is filled in with all sorts of soft materials, depending on the character of the dress; lace, tulle, net, chiffon or little vestees of washable organdie (sheer lawn or batiste will answer), with flaring collar to match, usually finished with machine hemstitching. Sometimes there is a shaped collar of satin, or whatever the girdle of the dress is, and inside of that a frill of lace, wired to stand up at the back like a Medeci collar. As to sleeves, anyone can have what they want so long as they are plain at the armhole—that is, no gathers. The kimono sleeve is still used, also the extra large, slightly enlarged and ordinary armhole, and all lengths are permissible. On the elbow and three-quarter length sleeves there is usually a cuff of some sort with a frill of lace, net or batiste, whereas the full-length tight sleeve has no cuff but is finished plain with a frill. As to girdles, anyone can also have what they like. There are a great many Roman striped girdles and girdles of contrasting materials, some finished with a bow, while others have a little bunch of flowers of contrasting colors to hide the fastening.

COATS, OR WRAPS rather, are of three general styles—the short, flaring Eton jacket; the big, voluminous wraps, all shirrings and frills; and the capes, which seem to be mostly in military effect. As figured and striped goods are combined with plain materials, and coats are sometimes of different material than the skirts, only being trimmed in some way to show that they belong to the skirts, or else being of a color contained in the skirt, it is easy to make over old dresses and coats.

MRS. BELLE BEARDSLEY.

The Rural Patterns.

When ordering patterns always give number of pattern and measurements desired. Price of each pattern 10 cents.

8229 Semi-Princesse Dress for Misses and Small Women, 16 and 18 years.

6775 Girl's Apron, 8 to 14 years.

8207 Girl's Low Belted Dress, 8 to 12 years.

8219 Girl's Middy Dress, 6 to 10 years.

8214 Child's Petticoat, 2 to 6 years.

8228 Boy's Box Plaited Suit, 2 to 8 years.

8224 Fancy Blouse, 34 to 42 bust.

8210 Tucked Blouse, 34 to 42 bust.

8208 Girl's Long Waisted Dress, 4 to 8 years.

7872 Gathered Blouse with Square Yoke, 34 to 42 bust.

FARM WOMEN'S PROBLEMS

LAW, SUFFRAGE AND OTHERS

Payment of Damage by Horse.

I BOUGHT an old, gentle mare and took her here to the blacksmith to get her hoofs trimmed. When I tied her there I saw she was hard to handle, but as I could be of no help I went away shopping. When I came back the blacksmith told me he could not do anything with the horse; she smashed a lamp, damaged a plow and so on—made $1.50 damage altogether that he wanted me to pay for. Have I to pay this?

Iowa. H. L.

Unless the blacksmith agreed to assume charge of the mare, or had already done so, it would seem from your statement of the case that you were negligent in leaving her without a caretaker after you saw she was hard to handle, and you, therefore, ought to pay the damage. If the damage was due in any way to the negligence of the blacksmith or his helpers in his handling of the mare, he would be liable.

Second Wife's Rights in Property.

What are the laws in New Jersey in regard to second wife's or husband's rights to each other's property, there being no children by second marriage?

New Jersey. H. R. C.

The rights of a second wife or of a second husband are practically similar to those of the first wife or husband. If there are no children or brothers and sisters, father or mother, or other relatives of either the whole or the half blood, or any descendants, all of the real estate would go to the husband or wife in fee simple, and the same would be true of the personal property, but if there were any relatives of course the distribution would be different.

Releasing Wife's Dower by Deed.

A buys a tract of land from B. A's wife's name does not appear in the deed from B to A. A sells the property to C, and in the deed to C the name of A's wife does not appear in the body of the deed. A's wife, however, signs the deed with her husband, and her signature is duly acknowledged before a notary public. Could A's wife recover her interest in said property because of her name not being mentioned in the body of the deed to C? If she could not hold her one-third interest in the property after signing with her husband in the transfer, why would the deed be counted defective, if counted thus? C. W. H.

Maryland.

There seems to be no decision on this point in the State of Maryland. However, in the majority of the States it has been held that where a wife does not join in the body of a deed by her husband, but merely joins in its execution by signing and acknowledging it, her dower is not barred, but there are decisions holding to the contrary, but on neither side is there a Maryland decision. It might be held that it was merely an inadvertence in not joining the wife's name in the body of the deed, and that she showed her intention of releasing her dower right by signing and acknowledging it. If the property is valuable, it might be worth while, provided the wife really did not mean to release her dower, to begin an action to recover her dower right. The deed is defective in not joining the wife as a party grantor.

New Jersey Marriage License Law.

I want to know something about the marriage laws of New Jersey. One of the contracting parties is a life-long resident of that State. Does the law require both parties to appear before the license clerk, and can the license be obtained and the couple be married on the same day. O. P. A.

The law requires both parties to appear before the clerk issuing the license, and the license must be obtained at least twenty-four hours prior to the time the ceremony is to be performed. The license will have to be obtained from the clerk of the city, borough, or town of the resident party.

Descent of Property Under Will.

My grandfather wills a share of his estate to his son (my father), said share to fall to me at my father's death. My father died leaving a will in which he requests that said share be equally divided among his children. Which will holds in the State of Pennsylvania?

Pennsylvania. T. D. E.

This would all depend upon the wording of the wills. A power of appointment may have been given to your father in your grandfather's will, and in that event your father could dispose of his property by his will. It this was not done, and as you said the property was given to your father for life, and then to you, then your father had no right to dispose of it by will, and it should go to you. Your grandfather's will would govern.

Inheritance of Illegitimate Child.

1. According to the laws of the State of Massachusetts can an illegitimate child inherit a share in property that came to said child's mother from her present husband? There are children by present husband. 2. What is the share of the widow when there are children in the State of Masachusetts? H. L. W.

1. The illegitimate child is the heir of his mother and of any maternal ancestor. The child would not receive property which came to his mother from her husband, unless the husband has acknowledged the child as his own. The illegitimate child whose parents have intermarried, if acknowledged by his or her father, is considered legitimate. If the mother wanted to leave any property to her illegitimate child, she could do so by will, wherever the property came from.

2. The widow is entitled to such parts of the personal estate as the probate court may allow as necessaries for the widow

ILLINOIS WOMAN AT THE WRINGER.

herself and the family under her care, and such other articles as are necessary for the comfortable sustenance of the family, and the use of the house and furniture for six months after death. The remaining property, both real and personal, goes one-third to widow, and the balance equally to the children.

Descent of Property.

What is the law in Michigan in regard to leaving property where there are two sets of children, the man having married the second time, if there is a joint deed? Does the wife have all the property that is left, to do with as she likes, or do the children come in for part of it? Do the children from the first marriage come in for more than those of the second? J. F. B.

If the property is held by the father and mother as tenants by the entirety, the survivor of them would hold it absolutely, and the children would not be entitled to share in it; but if they hold it as tenants in common, the share of the deceased would be distributed according to the law of the descent of real property. The property of the father would descend equally to all of the children, as it would through the mother if it originally came from the father. The law is that kindred of the half-blood inherit equally with those of the whole blood in the same degree, unless the inheritance came to the intestate from his ancestor, and in such case all not of the blood of such ancestor shall be excluded.

VOTES FOR WOMEN.

A Man's Sensible Opinion.

I am opposed to woman suffrage. I believe, however, that if a majority of women in State or nation want the voting privilege and duty they should have it, and I will, when shown that such a majority exists, not only withdraw my opposition, but turn in and help them. At present I thoroughly believe the great majority of women not only do not want to vote, but are opposed to having the duty forced upon them, and believing that, I should consider it an outrageous injustice to compel them to do that which they do not want simply to gratify a small minority who do. I have on several occasions told suffragist friends if they had any evidence tending to show that women wanted to vote I would thank them to present it to me. No such evidence has yet been shown. Most suffragists frankly admit that the majority of women do not want to vote, but notwithstanding that fact, those who do should be granted the right. I cannot admit any justice in such a claim. Some tell me they believe the majority of women do want to vote. When I ask for evidence they often promise to produce it, but so far I have heard no more from them.

Some suffragists say, as does your correspondent Emma B. Wilkie, "I for one want to vote," therefore the women "should have the privilege of voting whether they wanted to or not." If there is any justice in such a statement I would like to have it explained. I fail to see it. About the most expressive statement of the suffragist position is one attributed to Lillian Bell, the noted authoress: "Want to vote? Of course we do. Not that we care anything about voting, but because they don't want us to." When the majority of women want the vote they will have no trouble to get it. Until that time the few agitators who do should be disregarded. W. L.

A Country Woman's Yes.

This is why one country woman is in favor of equal suffrage. Because she does not believe in taxation without representation. She is tired of having to pay her hard-earned money and receive almost nothing in return; tired of having her assessment raised out of all proportion to others, and having money paid out lavishly on the roads, and then having roads that are so poor they endanger life and limb. She is also tired of seeing streets lined with saloons. She is tired of being in the same class as idiots, lunatics and criminals. Other reasons might be mentioned, but perhaps these are enough for now. Y.

An Iowa Woman's "Rights."

If I am the only woman in Iowa who wants to vote I should not be denied that right; if I am the only woman in the United States who wants representation in government I should be represented. Representation in government is an inherent right. My right to self-government is inherent because I am an intelligent human being; this right may be denied or abridged by others, but cannot be destroyed, except upon my own initiative. Being an intelligent human being, obeying the laws of the land, I should have a voice in naming the lawmakers—instead of which I suffer the disgrace of disfranchisement. VIOLA KAUFMAN.

EATING FOR THE FUN OF IT

WHAT HEALTHY MEN WANT

THE FARM SUPPLIES IT ALL

Good Meal for a Fruit Grower.

I WILL suppose the time is August, and the orchards and gardens are teeming with fruit and vegetable products ready for harvest, and it may be that the cook would prepare something like the following: Corn bread, butter, fried chicken and gravy, mashed potatoes, sweet potatoes, sliced tomatoes and cucumbers, Country Gentleman sweet corn on the cob, Lima beans, apple sauce, soft peaches and cream, apple pie, milk and water to drink, ice cream and cake. That would suit me, and if one is so dyspeptic he could not do justice to that, I am not able to provide it.

Lawrence Co., Ohio. U. T. COX.

Some Ohio Substantials.

IT is the plain and simple foods that one likes best and remembers longest, such as Graham or buckwheat griddle cakes with butter and syrup, bacon and eggs, an occasional roast of beef, veal or pork, baked potatoes, eaten with butter, and baked sweet potatoes and squash should be included, too. Then there are flaky baking powder biscuits eaten with butter spread with some fruit butter or jams; baked sweet apples eaten with cream, properly cooked peas fresh from the garden, or some corn boiled on the cob, and spread with butter, and eaten the way it was intended to be eaten; some nice sliced ripe tomatoes, sprinkled with sugar but without vinegar, or perhaps some well-ripened peaches with cream. Mush made of Graham or cornmeal and eaten with cream or whole milk is fit for anybody. The so-called fancy things are not important, and usually are more costly to prepare than they are worth, but for a warm weather dessert some home-made ice cream, made from real cream, is really worth while. Water or milk drank at meal time is all right and far better than coffee, cocoa or tea. Now it should not be difficult to pick out enough articles from the above list to make a good dinner, and I have but little choice which ones should be selected. W. E. DUCKWALL.

Ohio.

Singing the Wife's Praises.

MY wife is descended from old Virginia and Kentucky stock, and knows how to cook in a way I have never seen equaled even by my mother, and she was one of the best cooks in the world. One of the best things, and also the rarest, almost impossible to find it anywhere, is home-made cheese and the curd made from sweet milk, of which the cheese is made. Mrs. Allis has found out she can make any amount, no matter how small, of milk into curd and save it until she has enough to make a small cheese. It is as easy as making butter. I will tell you one meal that is not to be sneezed at: Young spring chicken, Kentucky style, and creamed gravy, mashed potatoes (no one but Mrs. Allis knows how to mash potatoes), bread which beats angel food, and such butter! Some kind of pie, of which the best is apple, custard, lemon custard, grape, black raspberry, etc., and Jonathan apple jelly and home-made cheese all through the meal and with the pie. C. ALLIS.

Maryland's Wide Bill of Fare.

WHEN I was a boy I thought that the height of good eating in Spring was a dinner of boiled turnip greens with smoked hog's jowl and cornmeal dumplings, all boiled together. I still like the dish, but of late years seldom get it, and in fact find that less hearty food is better, and now I am satisfied with roast chicken as the meat dish, and a good variety of vegetables, never less than three. At this time of the year we use green onions, sweet potatoes roasted (never steam them as Northern people are apt to) and spinach. When the spinach is over we use the young tops of the chard as a substitute, and a very good imitation of spinach, and later the matured leaf stalks boiled like asparagus. I am fond of sweets, and always like a dessert of some sort, just now rhubarb puffs. As a regular drink I use the fermented Bulgarian milk, and find it splendid, but still I drink some coffee. The various food faddists make me tired. It is not what a man eats usually, but how much he eats. A man can gorge on any sort of food and ruin his digestion, while he can eat in moderation what he likes and keep well. I have always done so, and now in my seventy-fifth year I am still doing so, have a very comfortable stomach and sleep like a baby, walk four to five miles a day, and work in my garden to rest from the desk work. I should say that I slip in a baked apple for dessert as often as anything, and always eat an orange or half grape fruit for breakfast. W. F. MASSEY.

"WHAT? HAVE YOU EATEN ALL THAT ALREADY?"

Virginia Home Farm Dinners.

THERE are two dinners that appeal to me, and I will mention them in order of preference. First (and preferable), the dinner in early Summer, company expected and we are going to give of our best, all home-grown. Fried Spring chickens, green peas and snaps and new potatoes creamed, followed by strawberries and cream (real thick cream), washed down by buttermilk during the meat course; cake and ice cream. Second, for Winter—roast turkey and Virginia boiled ham, cranberry sauce, potatoes, salsify, followed by baked apples and cake. Coffee or buttermilk. The turkey tastes better if stuffed with oysters, which can be obtained easily in most parts of this State of Virginia. Virginia cheroots, made of Virginia tobacco, are a good postprandial digestive.

WALTER WHATELY.

Sec. Va. Hort. Society.

The Best Meal I Ever Ate.

THE best meal I ever ate! Do I remember it? Well, I should say I do, the same as if it were yesterday. It was this way. One of my jobs, as a boy, was to get up early, go about three-quarters of a mile to a pasture and bring our cow in for milking. As the chilly Fall days came on, I would frequently get to the pasture soon after daybreak, and, being barefooted, it was one of my great joys to make the cow get up and warm my chilly feet on the spot vacated by the cow. On one of these frosty mornings I was told to hurry back, for there would be honey and hot biscuits for breakfast. Now, I am fond of honey, and, like a bear, would go a long way to get it. So, the morning in question, I did not waste much time in getting to the pasture, but, much to my disgust, I could not find the cow. The longer I searched, the hungrier I got, until the visions of honey and hot biscuits became fairly maddening. I finally found the old cow, and got her home, my appetite whetted by the cold morning and two-hour tramp, and I found the biscuits awaiting me, ready to be popped into the oven. The curtain may come down on a hungry boy, a pitcher of cold, sweet milk, plenty of fresh butter, hot biscuits and honey, real honey with the aroma of clover blossoms clinging to it like a breath of June. BEVERLY T. GALLOWAY.

My Most Difficult Meal.

ONCE upon a time long years ago I lived on a Western ranch in Montana. My husband was dairy foreman, and I did the cooking for the men. The number varied from five or six in Winter to 25 or 30 in Summer. The season had been excellent, and the Alfalfa was like a green sea in the sandy desert; 26 men were working to secure it. For help I had a girl of 16, who had come out during vacation, and a blue-eyed baby a year old. After a troublesome night with the teething babe, four o'clock found me tired enough to stay in bed. However, this was not to be thought of. The supplies were a day late, and after breakfast I found I had on hand two loaves of bread and about a quart of flour, and no supplies due till after dinner. On a 3,000-acre ranch you cannot telephone the grocer, neither can you borrow from your neighbor, for you haven't one nearer than four or five miles. So I was puzzled how to feed those men on two loaves of bread. I found I had about two quarts of bolted cornmeal (the real article was not to be had). A frantic search in the granary revealed a sack of bran. With the flour I had and the thick buttermilk I made brown bread. The buttermilk rose nobly to its duty, and it came from the oven brown, fragrant and tender. Left from the dinner the day before were onion and radish tops, carefully saved for greens, and a generous amount of spinach added. Early in the day I had put a home-cured ham to boil, and had planned on a 20-pound lard pail of tapioca to furnish dessert. About 10 o'clock the thermometer was standing at 90 degrees, and I picked the baby up and stepped out on the porch. I saw a livery rig turn in at the driveway. They stopped at the door. It was a U. S. Senator and two prominent physicians from New York on their way to Missoula to study the dread spotted fever that had broken out there. And they wanted to stay to dinner! They were to watch the men make hay and look over the sleek Holsteins. I tried to keep the consternation out of my face and tell them they were welcome, and they drove out to the field. I flew to the storeroom, hoping to find I had overlooked something, but no; two solitary cans of tomatoes and a bottle of cherished relish, made the year before of tender radish pods with vinegar and cayenne pepper, were all the empty shelves held.

There were about two pounds of macaroni left, and 29 hungry men to feed from it. The stove was full; not an inch of available room left. I poured boiling water over the macaroni and popped it in the oven to cook. I opened the cans of tomatoes, and put them in the oven, too, and when the macaroni was done placed them together. The long table, capable of seating 30 men, was covered with white oilcloth. Think of it, my friend, and I had been brought up in the East, where to entertain a U. S. Senator the very best linen and the choicest china would be used, and the most delectable of eatables furnished. I set the table with our dishes and the polished steel knives and three-tined forks, placing a napkin, made of a neatly hemmed sugar sack, at our guests' places, for they had asked to eat with the family, so I was taking them at their word. A tin spoon and a vegetable dish completed the dishes, and this was our menu:

Potatoes, boiled whole; hot boiled sliced ham; greens; peach pickles; brown bread (?); macaroni and tomatoes; radish relish; great pitchers of icy buttermilk; tapioca pudding; coffee, with thick cream.

I always kept a sweet pickle made of various kinds of dried fruit, and at this time happened to have peaches, and one of the greatest blessings we had was a well-filled ice-house. These men laid all the small conventionalities aside, and the ride had given them ravenous appetites, so they did full justice to the dinner. They enjoyed the simple greens without any garnish, and ate slice after slice of the brown bread. The Senator told me he was raised in New England, and it tasted as it did years ago when he was a boy on a farm and ate it fresh from his mother's brick oven. They sat at the table long after the men left for work, and told us many interesting stories of their life-work. Before they left they came to say good-bye, and the physician said when he finished his work he would take a vacation and visit us again, but after spending some time in the valley he was taken a victim of the fever and died. And this, I think, was the most difficult meal I ever served.

Ohio. MRS. JAMES LAMPMAN.

A Plain Meal Best.

I HAVE no recollection of any best meal as a single meal, although some time there may have been one which appeared "the best" for some local reason. I suppose what you really would like to know is what combination one likes best, makes the person feel best, and is a possibility. With me it is a 4 per cent milk, about one pint, with bread a couple of days baked, long enough at any rate to lose its freshness and will crumble, about three ounces of full cream cheese cured at low temperature for six months, a few crackers and two baked sweet apples. The ration is balanced, contains a variety, and "sets well" on my stomach. I mix the milk, bread and apples together, and eat the cheese on the side. Try it. H. E. COOK.

He Remembers Baked Apples.

OF course something depends on the season, dosen't it? When, as now, you can have asparagus *ad lib.*, or, as later, strawberries, green peas, or corn 15 minutes from your own bushes, you could not leave such things, and there are many more, out of your bill of fare. But if I must make up a real good dinner out of things that can almost always be had or are in the house, here goes: There is nothing quite so compelling to the board as the smell of good ham combined with a little onion in the frying pan. So I bid for some choice fried, or even boiled, ham, with potatoes fried with onions, homemade bread with plenty of sweet butter, three large baked Baldwins with the syrup cooked down and poured over them so that it jellies, plenty of cream and a nice bit of a cooky or ginger snap to end up with if there's any room. W. C. DEMING.

Caring For Household Pets

The Canary Bird and the Goldfish

The Happy Little Companion

A Canary At the Farm.

Folks has be'n to town, and Sahry
  Fetched 'er home a pet canary—
And of all the blame' contrary,
  Aggervating things alive!
I love music—that's I love it
  When it's free—and plenty of it;
But I kind o' git above it,
  At a dollar eighty-five!

Reason's plain as I'm a-sayin',—
  Jes' the idy now o' layin'
Out yer money, and a-payin'
  For a willer-cage and bird,
When the medder-larks is wingin'
  Round you, and the woods is ringin'
With the beautifullest singin'
  That a mortal ever heard!

Sahry's sot, tho'—so I tell her
  He's a purty little feller,
With his wings o' creamy yeller,
  And his eyes keen as a cat.
And the twitter o' the critter
  'Pears to absolutely glitter.
Guess I'll have to go and git her
  A high-priceter cage 'n that.

—James Whitcomb Riley.

My Friend the Canary.

THE canary, the cheeriest of household pets, deserves a place in every rural home. They are such lively, happy little creatures, perfectly contented all day long, and will sing no matter where you put them. The cage for this pet should be at least 10 inches long, 7 inches high and wide, and preferably of brass, which is easier kept clean; should hang from four to six feet from the floor.

Birds require a temperature of from 68 to 80 degrees Fahrenheit. If the room is cooler than this at night the bird should be covered. Do not hang your bird right in front of the window. When hung from the ceiling a little at one side he will get all the light and not feel the cold that comes through the glass. Be very careful about drafts at all times, as birds are as susceptible to colds as concert singers, and not as easily cured.

GENERAL CARE.—Birds love a sunbath, but never place them in the midsummer sun without some shade, and keep out the Summer sun at noon. It is best not to hang your bird out of doors in the Summer, as he is so apt to take cold. Possibly on a sultry day, when the wind does not blow, he might be put out of doors for a couple of hours in the middle of the day.

So many people say to me, "My bird does not sing." I ask them, did he hang out doors last Summer, or in front of the window last Winter. "Yes, he hung out all Summer, and I do put him in the window." It is best to keep your bird well and you will not have to doctor him.

FEEDING.—When purchasing a bird go to some reliable person and pick out a healthy bird, and there will be less danger of its getting sick. Young birds have pink feet. The two kinds usually found in bird stores are the Hartz Mountains birds, or natural singers that have received but very little training, and the St. Andreasburg Rollers, which have had the best of training from the first. The latter are much superior to the first mentioned. Canaries are said to be the greatest gluttons in the animal kingdom, so beware and do not overfeed. Feed one-third German rape and two-thirds canary seed. Give fresh water and gravel daily; in Summer fresh water twice a day. Keep cuttle bone always in cage. Every few days give a bit of green food, lettuce, chickweed, apple if it is ripe and not too sour. Each week one-half teaspoonful of song food placed on floor of the cage or in special dish. Do not feed hemp seed. Once or twice a week and all through moulting time feed the egg mixture, and if he should be ailing he relishes soft food more than seed.

INSECT PARASITES.—One of the greatest enemies the birds have is lice or mites; but if proper precaution is taken you will have little trouble. Place damp white cloth on cage for an hour in the evening, or allow to remain all night. You will see tiny red mites on it when removed. Scald cage occasionally and paint end of perches and where swing hangs with coal oil. Wash cage with soap and water once a week, and either wash and dry or scrape perches often. Dust bird with mite exterminator. Allow bird to bathe every other day, twice a week in cold weather.

OTHER CARE.—Manicure bird occasionally; catch and hold to the light; cut the nails just beyond the red vein in foot or toe. If feet are sore or scaly, soak in warm water for several evenings, dry and apply a little vaseline. Moulting season with canaries is in July, August and September. They are weaker during these months, and should have the best of care. Keep out of draft, feed cracker and egg mixture often, with a little song food and some green relish. The German remedy for all bird ailments is a small piece of salt fat pork, rubbed over with cayenne pepper. The egg mixture consists of the yolk of an egg boiled 20 minutes and three or four oyster crackers, pulverized, and a generous pinch of cayenne pepper. This can be slightly salted. Mash fine and mix well. Great care should be taken in selecting seed, as inferior seeds are substituted and are injurious to the birds. The small round brown seed is rape, and tastes sweet, and if your seed should be bitter do not feed it, as it is mustard or some inferior seed. The light seed is Sicilian canary, and should be bright and shiny. Some bird-seed mixtures have millet, which will not hurt the bird, but he does not require it. The German breeders feed only the rape seed.

Birds kept by these directions will be healthy, happy, and very little trouble. It is necessary to know your birds and love them if you would be successful. Try to gain their confidence, move slowly when working by the cage, avoid all quick motions which might scare the bird. Give your bird a name and talk to it, and you will soon find it will become well acquainted with you. If it is necessary to catch the bird, put the hand in slowly and do not attempt to catch him until you are sure the opportunity is right for it. Hold him carefully with his wings closed so he cannot flutter or riffle his plumage. It is a good plan to let the bird out occasionally and fly around the room. Exercise is very beneficial, and it makes them so happy.

LORETTA B. MOORE.

Care of the Pet Fish.

Will you tell me the right care for goldfish? How prepare the aquarium, and how often to feed the fish and to change the water, what to do for the fish when they are sick, drop the fins and act sluggish? A. S.

Not knowing the conditions existing I cannot answer definitely what remedy would give permanent relief. An aquarium best suited to fish should be rectangular; the round globes distort objects and do not appear to give as good results. There should be a bed of nice clean gravel at bottom and sufficient plant life to keep fish healthy—parrot's feather is a suitable and much used weed—and the water should be obtained from a healthy source and always the same. City water often, from filtration, is too pure for aquarium use, and sometimes retains sufficient chemicals to injure the fish. Well water makes a good unvarying supply in most cases. The gravel bed in a small aquarium can be kept clean by using an ordinary hand syringe and forcing fresh water into the gravel, which agitates it sufficient to allow uneaten food and other impurities to arise and be removed. Goldfish should be fed about once a week and in limited quantity, never more than twice a week. The best way to fill an aquarium is with an ordinary dipper—taking out enough of the stale water to reduce the bulk in aquarium about half and replace with as many dippers of fresh water as you had taken out. While filling also agitate water by filling dipper, raising it and pouring it back so as to bubble the water as much as possible.

When the dorsal fin drops on a fish it is a sign of sickness and he should be promptly removed from aquarium and segregated for study. If he develops "tail rot" it is better to kill him, but if only fungus growth it can be cured by placing it in a salt bath for a few moments. In preparing such a bath take a sufficiency of water out of aquarium so as to retain even temperature and place in a bowl, put a teaspoonful of salt in this and remove sick fish with a silver tablespoon and drop him into salt bath—he should remain in this about 20 seconds, but if he turns on his side and shows signs of distress take him out into fresh water again. When rested and refreshed you may repeat salt bath if necessary. In marked case a fungus growth the spots may be touched with hydrogen peroxide, using a feather for the operation. A simple way of removing small particles from the bottom of an aquarium is to use a glass tube.

H. S. H.

MOTHERHOOD.—The picture shown on this page was printed in "Our Dumb Animals." The incident is vouched for by a reliable correspondent. The mother rat was killed and the childless cat actually adopted the young rats and nursed them as we see in the picture.

Back to the Farm.

THIS is the title of the play which the Minnesota students use as a human bulletin for advertising the agricultural college. Here is a bit of the humor—a dialogue between Gus, a Swedish hired man, and Hulda, the maid:

Gus: "Har, vat you doing?"

Hulda: "Ay sweeping des floor."

Gus (rising and coming over to her): "Don't you know no better dan to raise all dis dust? You stir up all the yerms and bacilli and tings. You gat hydrophobia if you don't look out. Dat ban dangerons. Don't you keep your mouth open all de time. Dat ban dangerons, too." (Goes back, sits down at desk and writes.)

Hulda (edges up to him): "Ay like you ven you talk like dat. You are such smart man. Ay going to marry you, ain't I?"

Gus: "Ya, when you learn to be up-to-date farmer's wife, but not until den."

Hulda (edges nearer and nudges him with her elbow): "Ay like you pretty good. Ay let you kiss me, if you vant to."

Gus (just about to kiss, stops short and holds up hand as if to ward her off): "No, dat not be sanitary."

Hulda: "Oh, Gus!"

Gus: "No; ay tell you dat not be sanitary." (Pause.) "Ay bane reading dat on das paper. Ah, ay got good idea—strain 'em out yist like das milk." (Crosses to desk, takes piece of cheesecloth from the desk and places over her mouth and kisses her. Crosses to L. with thumbs t ust in his vest and chest thrown out, returns and kisses her again.)

This will, no doubt, raise a laugh, and will be accepted as a good jab at the "germ theory," but that's the way we prefer to have strangers kiss the baby—only a steel plate would be better than cheesecloth.

As Others See Us.

I wish to tell you how I came to be a subscriber. I attended a poultry show, and there was a young man there representing THE R. N.-Y., and he was such a persistent talker that I gave him 10 cents to get rid of him. I took the paper home and read it, and I liked it so well that I subscribe for it every year, and hope I may be able to do so as long as I live. G. W. J.

That young man kept on talking because he had a good thing to talk about. "We are advertised by our loving friends."

I have just finished reading this week's R. N.-Y., and I am a wiser woman farmer. MARY BAILLIS.
New Jersey.

The woman farmer usually has a struggle to keep her farm going. We will help whenever we can.

Enclosed please find $1 for which send THE R. N.-Y. to Mr. W. K. Slygh. Being an "old batch" I want him to have good company, and believe me, nothing could be better than THE R. N.-Y.
H. B. G.

When we consider who is usually considered the ideal companion for an "old batch," this is a high compliment. Let us hope THE R. N.-Y. will start such a home feeling that the "old bateh" will be compelled to make the home complete.

I feel that I cannot close this letter without thanking you for the good I get out of the paper. It helps me to keep faith in the world and in people's advertisements. I am not afraid to send money to a R. N.-Y. advertiser, for your paper would scare the rogues away.
Florida. I. M. S.

We would throw a scare at them at least, and keep them out of the house from the beginning. The wolf would have to give a very good imitation of a sheep to get in.

Page 636 of THE R. N.-Y. is alone worth the price of one year's subscription. You will find inclosed the name of a few of my friends whom I want to have a sample copy of such a paper as you are putting out. We take a great many publications and of a great variety, but yours is very near the top in the list.
New York. FLORA S. UPTON.

This was the page containing that article on parcel post for farm women. There can be no question about the possibilities in this line. It takes time, patience and some money to develop any new way of doing business, but there is no doubt that thousands of customers are waiting to learn where they can buy the things which farm women have to sell.

We receive so much benefit from THE R. N.-Y. and enjoy the editorial page, the Hope Farm man and the woman's page so much that it is the first magazine we open. We find in it the discussion of the problems that we are interested in and the article "Parcel Post for Farm Women," in April 25th issue put more encouragement and hope into my system that anything I have read in years. We have had several large fruit crops with low prices and last year a complete failure. The Summer boarders are our most successful asset. The parcel post article pointed out things that perhaps we could sell in the city market—vegetables and choice fruit—by working up a trade among people who come here to board. We cannot do it in our small town. M. H.

My husband was very much alarmed about our cow last year. Our neighbor told us to bring a veterinarian, but the one in our district does not seem to realize just what a cow means to a poor farmer, and so I told my husband to wait and that I would ask THE R. N.-Y. what to do for our cow. As the paper helped others, it would help us too, and so it did, for Dr. Alexander told us just what to do for the cow, and she was saved through good treatment, and brought through her sickness safely, and that is why as poor farmers and back-to-the-landers, we think so much of THE R. N.-Y. MRS. JOHN B.
New Jersey.

We wish we could always settle these cases so happily. Sometimes people wait too long about describing the animals and then do not make the symptoms clear. The women are usually clearer than the men, and they give sick animals better care.

The Wild Flower Collector

By IDA M. JACKSON

PART I.

LUCK has come to the country girl. The thing that the world wants is right at her door. Perhaps it is the bunch of blue vervain that flourishes in the wood-lot, or the clump of elder bushes over by the duck pond. There are scores of desirable plants that are not in the dealer's catalogue. Indeed, there are but few plants of any kind that do not have marked decorative value sometime during their life. It is astonishing to find out how many lovely things grow in out-of-the-way places. Learn to see things. A trained collector will find something of value wherever he goes. There are dozens of beautiful wild flowers worthy of cultivation, and all of them show improvement in the hands of even an ordinary gardener. There is a neat little fortune for the person who will plant and cultivate the bird's-foot violet. Take for example the Colorado nurseryman who is making the flora of his State so popular. He saw surpassing grace and beauty in the Rocky Mountain columbine. He collected plants and saved seeds till now he supplies the world with that beautiful flower. He it was who saw, as in a vision, the possibilities of the Mariposa lily, and to-day every one of those lilies that finds it way into the channels of trade passes through his hands. Another worthy flower is the wood Anemone. It ought to be called "Poet's Anemone." Its drooping involucre, its sweet little flushed buds, which finally open snow white, all combine to make it a desirable plant for any situation.

WOODLAND BEAUTY.—The Sabbatia angularis, with its perfectly delightful star-shaped pink flowers in an ample panicle, comes at a time when blooms are scarce. Seeds of this plant could be gathered and sown in the Autumn or early Spring, and in a few years a fine bed of plants would be the result. Sabbatia angularis is a near relative of the beautiful blue-fringed gentian. Among the creeping plants none is finer than "trailing wahoo." It is at its best when grown on the bank of a stream, and nothing could be prettier than its shining green leaves and pink berries reflected in the water. Mitchella repens or partridge berry is another pretty creeper. Its red berries remain all Winter. The daintiest of all the "carpet" plants is Linnæa borealis. It loves the mossy woods and cold bogs of the North, but can be grown in more southern localities. The flowers are small and sweet scented. This is not a fad of the hour, as an ever-increasing demand for wild flowers from numerous sources will testify. A few progressive nurserymen and florists do a large business in wild flowers as a "side line," one firm distributing to the trade as many as one hundred thousand plants of a single species in one season.

NEEDS AND SUGGESTIONS.—Fortunately many country girls have had a high-school course in botany, and are prepared to begin the work at once. In all orders sent out botanical names are used, and if an unfamiliar plant is called for the text-book can generally be relied on for descriptions. Learn to visualize descriptions. Dealers have their lists, which can be had for the asking. Such plants can be selected as can be done to advantage, and the dealer advised. Right here let it be said that the thing a collector *must do* is to get the plants that are fairly abundant in his locality and let the "other fellows" get those that are plentiful with them. Always leave plenty and to spare for next year's seeding. Accordingly as a species is more or less plentiful the dealer expects you to gauge your prices. For instance, a collector at one station might get out Phlox divaricata (incorrectly called wild sweet William) for three dollars per thousand and make good wages, while another collector at a different station would have to ask six dollars per thousand because of scarcity.

COST AND PRICES.—The dealer always sends an inquiry and asks your best price before placing the order. Almost every locality is rich in some one or more species, and these you can get out at 20 or 30 cents per hundred and make as good wages as a dressmaker or school teacher. I have offered to get cranesbill, Greek valerian, Smilacina racemosa (false spikenard), and several other items for two dollars per thousand because they are so abundant that I could well afford to do it. These offers are all booked, and some day the hoped-for order will appear. At this writing I have an inquiry for 500 Asclepias tuberosa, the beautiful orange-colored milkweed; also my best price per hundred. Now, I have only 50 of these plants located, but I don't wish to turn down a prospective order, so I write, explaining the situation and ask for a few days to investigate. Perhaps my price of two dollars per hundred will see a little high to the dealer, but if none of his other collectors can supply him any cheaper then I get the order.

AN ATTRACTIVE SERVICE OF GREENS.

Springtime Greens.

AT this time of year we are laying aside the heavy clothing of Winter, opening our windows and doors to the warm breezes of Spring, and as we also turn away from the heavy foods of Winter nature demands a decided change of diet. Now is the time when we want the delicate green foods of Spring; salads, asparagus, and greens of all sorts. This is a good time to form new food habits and better ones for the better health and the greater efficiency of each member of the household. At a recent address before the new canning and garden clubs of Cortland Co., N. Y., Prof. O. H. Benson, U. S. Department of Agriculture specialist in charge of canning and garden club work, spoke very convincingly of the great need of the American people for better food habits. As a nation he said we are accused of three things; of being a nation of spenders, a nation of weak stomachs, and a nation of patent medicine users. Much of this he attributed to the fact that we are a nation of meat eaters. He did not advocate vegetarianism, but he did wish the people to learn to put meat in its proper place in the diet, using it more as a condiment, or a seasoner of food, not putting it on our tables as a dish by itself oftener than once a day. Along the line of his work he had interviewed many prominent physicians, who declared that 85% of their patients are sick because they aren't properly fed. Their diet includes too much protein, too little cellulose or bulk foods, such as the outer layer of grains, and the fruits and vegetables, and too little of the valuable vegetable acids and mineral salts of fruit, vegetables and greens. He had corresponded with various druggists in different States of the Union, and at his request they had kept accurate records of daily sales. The lowest record of any drugstore of any State reported over 60% of the sales to be of patent medicine laxatives, while some reported it as high as 90%. All of this harmful habit-forming drug habit is necessitated because people will not eat enough fruit, greens and vegetables. They prefer to take their salts out of a bottle, instead of in a palatable, attractive form. The food they are in the habit of eating is too concentrated, and far too rich and highly seasoned. Consequently a large percentage of the people are ailing, and inefficient. There are few jobs where efficiency does not count. And every one in the heart, longs for perfect, abounding health. But people will spend large sums of money and do everything under the sun but reform their habits of living and eating.

THE BLOODROOT, SANGUINARIA CANADENSIS.

Perhaps the earliest to those in reach of the markets, is lettuce. At five cents a bunch lettuce is as cheap as any food of equal value to be bought. A home-made cold frame will soon raise enough for the family table long before that sown in the open gardens is ready for use, and in it may be started early lettuce, beet, tomato and onion plants for transplanting into the garden for an extra early supply of those.

The dandelion is springing up everywhere and in its youngest earliest days it is best to use it raw in salads. A good one for everyday use for a time is made of at least one chopped hard-boiled egg for each member of the family. Add an equal bulk of the tender young dandelions also chopped and a little chopped raw onion, if liked. Over this turn a dressing made of two tablespoons of olive oil to one of vinegar or lemon juice, one-half teaspoon of mustard, one teaspoon of salt, one-quarter teaspoon of pepper and one teaspoon of maple syrup or of sugar. It is well to make a large bottle of this dressing in the proportions given, mixing it thoroughly by vigorously shaking the bottle. This dressing in itself is an appetizer and laxative, and very easily prepared.

To vary this salad, use different greens such as young horseradish leaves, mustard, sorrel, lettuce, cucumbers, radishes, tart apples and crisp raw cabbage finely shaved, which is a never-failing and valuable laxative and iron tonic. Instead of eggs other fillers may be used in the preparation of greatly valued salad, such as cold boiled potatoes, boiled cabbage, carrots, beets, and other vegetables, cold boiled greens, beans, canned snap beans, peas, tomatoes, sweet peppers, boiled rice, macaroni and spaghetti, noodles, cracker and bread crumbs and occasionally cold meats. Other dressings as the well-known mayonnaise, sour cream dressings, and plain boiled dressings may be used. Thus the combinations are endless. And all are attractive and very palatable.

And while the greens are in their prime let us learn to can them, if we never have done so before. Pint glass cans are best for most family use, Swiss chard perhaps the best greens known. Besides this there are beet greens with the small beets on, mustard, spinach, kale, redroot, dandelions and milkweed. All are good and easily canned. The method is much the same for all kinds. The following is that recomended to the canning clubs that are under supervision of the government specialists, and may be considered as thoroughly reliable. First, clean and wash well. For convenience it is best to place them in a wire basket and immerse them in boiling water for from five to 15 minutes, depending on the tenderness, bitterness, or acidity of the various kinds. Dandelions, for instance, should be boiled for from 10 to 15 minutes, on account of their excess of bitterness. Then lift the basket and plunge it into cold water. This checks the flow of the juices that have started, and coagulates them. This blanching process serves four purposes. It reduces the bulk, eliminates the acids, checks flow of juices preserving the color bodies, and reduces the time of the cooking after it it placed in the cans. If some sort of seasoning is desired a slice of bacon may be placed, in each can. Then the can should be filled, adding hot water to level it to the top; add one teaspoon of salt to the quart or one-half teaspoon to the pint can, place the top in position, using only new rubbers of good quality. Partially tighten the top and place in a covered wash boiler, or 16-quart tin sap bucket, either of which should have a perforated board or slat bottom on which to stand the cans. Fill with warm water two-thirds the height of the can. Throw over the top a cheese cloth or heavier cloth, and over this fit the top on as tightly as possible. Put a brick on each end of the boiler cover, or on the close fitting pan or basin chosen to use as a cover for the bucket, and boil for two hours. Then remove, tighten the tops at once, and invert. All cans and rubbers should have been sterilized in boiling water before filling and care should be taken not to touch the inside of cans or tops with hands after. In Winter, or later in the season these canned greens will prove a blessing to the daily menus. They may be used in soups, cream sauces, jellied and molded for salads with all sorts of dressings, garnishes and accompaniments. A well-liked but little known combination, is tomatoes with greens. Add a can of tomatoes, juice and all, to a well drained, seasoned and chopped bowl of greens. The tomato will mingle agreeably with the greens and its acidity gives the greens the needed tartness or flavor. Bacon fat or butter, or plain boiled salt pork makes a good seasoning for all greens.

MRS. E. G. FLINT.

"AT any rate, I can truthfully say my business is never at a standstill." "What is your business?" "Moving pictures."—Judge.

THE COMMON QUESTION

THE HIRED MAN'S CHILDREN

The Parents to Blame.

IN so many advertisements for help we read "no children." If one has been about the world very much, and mingled with all classes, the question why the children are not wanted by those who hire is very soon answered. It is not always the fault of the child, but more often the parents. They are not brought up to obey, neither are they taught the rights of others, or not to meddle with what does not belong to them. Again, what they do at home why not away from home? An instance comes to mind which happened some years ago. A sister-in-law and little daughter of some three years were spending the day with us on the farm. While preparing dinner I heard the piano keys making strange sounds. As the mother knew I never allowed small children to touch the piano, and she was sewing in the room I waited a moment, but the sound continued, and going to the door I found the child walking on the keyboard. I told her to get right off and never to do it again. "Mamma lets me walk on hers," she said. "Never mind if she does, you cannot walk on mine," I replied, and she never did. Who was to blame? The mother without question. We hired a man and wife one time, the wife to assist with housework. They had a little baby boy six or eight months old. Before arrangements could be made for accommodating them they slept in the spare bedroom. It was a small room, and I thought the room upstairs was large and more pleasant. It was not finished, but was a very comfortable room in Summer. After moving, up to the garret, they called it, the woman did not seem to care to do more than she was obliged to; her baby took very much more time to look after, wash for, etc., in fact she did not begin to pay for her board. Sometimes she would leave him on the bed, and read or go out of doors for her own amusement, the baby crying at the top of his voice. The man was a good worker, and they needed the wages badly, but we discharged her, he staid a while after, then left.

When in New York State, some years ago, a friend wished us to go into a fine house as caretakers until the owner could occupy it some months later. "I want no children to mar the house." My husband made the remark that his father had a large family, but they were brought up not to injure, break or hurt in any way the house or surroundings, but it is one case in a hundred where they are so taught. The bump of destructiveness is very large in some children. A young girl called here with her parents a few days ago. She never had been here before but she tried to see into every room, even the pantry door was tried, but her mother spoke to her not to open it. I have seen little children pound the windows with whatever was handy without a word from the mother—it was not their house. In a nutshell the answer is, teach the children to mind, be respectful, and not injure property, and the "no children" advertisement will not appear.

MRS. FREDERICK C. JOHNSON.

Children Not Well Trained.

This question of children other than our own constantly about us, is not a simple one, so much depends on circumstances. For instance, a man who owns a farm has more authority over lawless children than a woman would have. If he loves children, has true dignity, and has even poorly brought-up children on his farm, he can control them to a certain extent, which a woman could not so well do. Thus, he might be able to manage without being too much annoyed by children, even if the parents themselves were ignorant or unreasonable, or both, and the children unbridled. Taking the average run of help, we find very often parents utterly unfit to bring up children, who thus become a nuisance, being destructive and not being old enough to work, finding pleasure in many ways which are not agreeable to the farm owner, such as swarming over barns and storehouses, and penetrating even into the storerooms where goods are stored, appropriating what they fancy, painting black stripes on a red barn, possessing the orchard, biting great apples and then throwing them on the ground, driving nails in the window casings, and whittling them, etc. All these things have happened here, and we have been very free from annoyance compared with those who have had more children about. No objection is made to a peaceable, law-abiding pair of parents, with children who are early taught that the house, yard and garden which they occupy is sacred to them, and the house, yard and garden which we occupy is sacred to us. The reason, then, why, as a general thing, I fight shy of children belonging to hired help on the farm, is not that I do not love children even fairly well brought up, but because I have the same objection to having a horde of unbridled children over whom I have no control, romping over my home, that you would have to riding behind a team of lively horses with the reins dragging on the ground. You could manage the team, even if lively, if you had the reins, but you object to being at their mercy.

E. E. D.

Turkey Raising For Women.

I PROMISED I would give an article on turkey raising. We certainly have had a fine article on page 426, March 14 issue. I agree with Mrs. Grover when she says, get good stock. It is essential to successful turkey raising. What most I am to say is to urge women and girls who are on a farm, and would like to earn a little "pin money," to try turkey raising. You certainly would be surprised how much you can earn in this way as a side line. It is not necessary to give all your time. Turkeys always bring a good price at Thanksgiving time. The markets never have too many good large fat turkeys. It is a fascinating business; you do not know how interested you may become in turkey raising. They are intelligent birds, and learn to come to your call. You can work up a good business as a fancier if you would but try. Get the best stock you can find, raise some choice birds, and see how quickly you can dispose of them at a good price. I would not have you think it an easy business, for there is work in any good business, and a certain expense to be met.

THE HEAD OF THE FLOCK.

A young woman said to me recently: "Would you advise me to go into the business largely?" Said I: "By all means no. Get a good trio of turkeys, and see what you can do before you go into it extensively."

When I commenced my father gave me two Bronze hens. They laid 26 eggs and hatched every one. One little poult died when but a day old; the 25 I raised to full-grown birds. I dressed and shipped them to the Boston market, and they netted me $44.85 at a very low price at that time. I can say I felt very proud of my two turkeys. Of course they must be fed, but any farm ought to furnish the wife or daughter feed for her turkeys. Again, there are people who think a turkey the worst thing that could come upon the premises, but that is where they are mistaken, for they destroy innumerable numbers of insects, such as grasshoppers, crickets, bugs, grubs, and I have seen them eat small snakes. They certainly are a benefit to the farmer in that way. Turkeys are not as hard to raise as one may imagine. As Mrs. Grover said, everyone has individual methods of caring for them. I hope someone who reads this article may at least try luck at turkey raising.

MRS. E. J. RYDER.

Jefferson Co., N. Y.

Good Meals For Baby.

ALLOW me to put a plea for the baby of last year as the warm weather is coming on. We often hear about the difficulties of the baby's second Summer, while as a matter of course they are less than those of the first Summer necessarily, the popular opinion probably rising from the fact that many people seem to think the little stomach has grown or advanced during the previous Winter from baby to adult capacity. Nearly everyone is fairly careful what baby gets to eat the first year, but by the second year they think nothing ever did kill him, and now he can eat pork and cabbage. Naturally the little stomach revolts and we have a very sick baby. Now, when you have a very tasty vegetable soup, don't, in common mercy, divide with the baby; far better give him one vegetable at a time, and we would know better than to do that, but in a soup almost anything looks harmless and we don't think. Broths, if not too highly seasoned; cakes and cookies made with cream, custards, bread puddings, eggs, both raw and cooked, rice, and a great variety in the same line furnish so many safe foods that there is little excuse for subjecting baby to the pain and danger of improper foods. Of course these things must be adapted to the individual child. The highly recommended fruit juices, for instance, don't agree with our baby at all.

Another source of danger is the frequent changes in temperature. We are busy house cleaning, gardening, etc., and often fail to notice the change till baby gets chilled, especially when the first warm days come, and we enjoy them so much.

M.

Husbands and Home Improvements.

NEARLY all the farm papers have been printing the wife's side of the home improvement topic. Somehow I became imbued with the idea that I was being mistreated, and not having the many labor lighteners that I ought to have. But I couldn't make myself believe that it was necessary for me to resort to rebellion and adroit schemes in order to get them. My husband did not, I felt sure, require that kind of treatment to make him do the right thing. One evening I mentioned my ideas to him. He heard me out and then he went and got his account books and showed me plainly just what hard work and skilful planning had done in making both ends meet and lap just a little over, the past year. He said, and I know it is the truth, that the improvements placed on the farm and its buildings were just as much for my interest as for his, we being comrades and partners; that they meant larger profits and that those profits would permit, in time, of my having all the many modern improvements that I craved. Meanwhile, he would help me as much as possible with the hardest work. It seems, to me, that this most common problem ought to be met by wives with a spirit of tolerance and good will. I do not believe that many farm men deliberately refuse to furnish such conveniences to their women folks. When they do, then no one can blame the wives from resorting to almost any tactics necessary to secure them. But, to my mind, the average farm husband likes modern improvements as much as his wife does, and is ready to furnish them if financially able without being compelled by strikes and undignified conspiracies.

MARY E. GARDNER.

When you write advertisers mention The Rural New-Yorker and you'll get a quick reply and a "square deal." See guarantee editorial page.

1913 RECORD

Magnificent Crops in all Western Canada

All parts of the Provinces of Manitoba, Saskatchewan and Alberta, have produced wonderful yields of Wheat, Oats, Barley and Flax. Wheat graded from Contract to No. 1 Hard, weighed heavy and yielded from 20 to 45 bushels per acre; 22 bushels was about the total average. Mixed Farming may be considered fully as profitable an industry as grain raising. The excellent grasses full of nutrition, are the only food required either for beef or dairy purposes. In 1912, at Chicago, Western Canada carried off the Championship for beef steer. Good schools, markets convenient, climate excellent. For the homesteader, the man who wishes to farm extensively, or the investor, Canada offers the biggest opportunity of any place on the continent.

Apply for descriptive literature and reduced railway rates to Superintendent of Immigration, Ottawa, Canada, or to Canadian Government Agent.

HOME COMFORT

A Good Percolator is a necessity in every household. We will send you the percolator described below, delivery charges prepaid for

Three (3) New Yearly Subscriptions or Six (6) Renewal Subscriptions

(One of these may be a renewal of your own subscription.)

Percolation is the automatic process of pumping hot water up the tube and over the coffee grounds extracting only the good of the coffee, leaving the coffee free from any muddiness or bitter taste—a perfectly clear, delicious, full strength beverage, wholesome and always uniform. This Seven-Cup percolator is made of the best grade Lake copper, handsomely nickel plated; aluminum basket; rosewood handle—handsome pattern. The percolator is of simple construction; no complicated mechanism to get out of order; easy to operate; easy to clean; absolutely sanitary.

The percolator "pays for itself in the coffee it saves." The retail price of this percolator is three dollars.

If your neighbors are not subscribers to the Rural New-Yorker, get their subscriptions. If they are subscribers, get their renewal.

Rural New-Yorker, 333 West 30th St., New York.

Live Stock and Dairy

BROWN SWISS CATTLE.

Our attention being called to an article regarding the Brown Swiss cow on page 500, I thought a short article giving a few facts regarding their history in this country and their proved dairy qualities would be of interest to your readers. As I have been owner and breeder of these cattle since 1877 I am somewhat familiar with their characteristics and history. Moreover, I have owned many of the animals that have been a credit to their breed. Coming originally from Switzerland, a mountainous country, where they have been bred, we have good reasons for believing, in the same locality by a pastoral people for the same purpose, viz., the production of milk of superior quality, for a longer period than any other breed of cattle. They were first introduced into New England, where there are to-day many excellent herds, representatives of which always attract attention by their beauty whenever shown by their owners at the fairs in the different States. These cattle are extremely hardy, and have gradually moved westward from New England, so that now there may be found large as well as small herds among lovers of good cattle in all the Middle and many of the Western States, Wisconsin, a dairy State, rapidly taking the lead in the number of herds owned within its borders. Those who are breeders and owners of these cattle do not keep them simply because of their attractive appearance but because they find them to be profitable milk producers.

It is now nearly three years since a registry of production was established by Brown Swiss breeders, with the result that no breed has ever made more rapid progress or qualified a larger percentage of its own in so short a time. To-day College Beavura 2d 2577, owned by the Michigan Agricultural College, with an official record of 19,460 pounds milk and 798.16 pounds butterfat, stands at the head of the list of mature cows in Register of Production. There are in this register 39 mature cows with an average of 11,446 pounds of milk, 447.91 pounds butterfat; 16 cows five years old average 12,087 pounds milk, 483.08 pounds butterfat; 14 cows four years old average 10,108 pounds milk, 409.76 pounds butterfat; 15 cows three years old average 10,010 pounds milk, 403.30 pounds butterfat; 10 cows two years old average 8,422 pounds milk, 360.59 pounds butterfat, making 94 cows and heifers with an average of 10,805 pounds milk, 439.91 pounds butterfat.

With these records of production secured with the coöperation of various agricultural colleges in making the tests, we have convincing evidence of the value of the Brown Swiss cow as a milk producer. Still other records are being made. Two sister-cows of this breed owned by us have just completed a year's test for the registry of production. Zerelda 2929 gave 14,145 pounds of milk and 574.98 pounds butterfat. Mawnautuck Girl 3575, two years younger, gave 13,463 pounds milk, 498.42 pounds butterfat. In a seven-day official test Zerelda gave 332.6 pounds milk, 12.147 pounds butterfat; Mawnautuck Girl gave 365.3 pounds milk, 12.457 pounds butterfat; Cleopatra's Minnie gave 458.0 pounds milk, 14.641 pounds butterfat. The interested reader can draw his own conclusions from these facts. G. W. H.

Wethersfield, Conn.

Silage a Substitute for Dry Feed.

I became involved in an argument with a neighbor who has not much to say in favor of the silo, and the controversy developed some very interesting figures. In fact it was necessary to do quite a little figuring before the silo won out over the older methods of storing feed. From the feeding tables and from experience we find that 30 pounds of silage can be substituted for 12 pounds of clover hay in a cow's dairy ration. Using that ratio as a basis and placing the value of an acre of land at $150 the following figures show the results obtained from comparing silage with dry clover hay as a feed. The yield on good land of 3½ tons clover hay in the two cuttings is used and also a yield of 14 tons of silage corn on the same land with the value of $150. Such land would yield 60 bushels of corn to the acre.

Cost of producing an acre of clover, the nurse crop paying for the seeding:

Use of the land 2 years, 5% interest and 1½% taxes on $150	$19.50
Seed	2.50
Cost of harvesting 3½ tons at $2.50 per ton	8.75
Barn storage or depreciation and tax charges at 50 cents per ton	1.75
Cost of an acre of clover	$32.50

Cost of one acre of corn put in the silo:

Interest and taxes for one year on land	$9.75
Seed corn	.20
Labor; plowing, harrowing, rolling, planting, cultivating and cutting for one acre, allowing $1.25 for labor and $2.50 for team work and estimating the time at 35 team work hrs. at 25 cents per hour	8.75
Cost of filling silo 14 tons at $1 per ton	14.00
Interest of $10 on a value of $200 for a 100-ton silo and $12 depreciation makes $22 for seven acres of 14 tons or for one acre	3.14
Cost of an acre of corn in the silo	$35.84

If it takes 30 pounds of silage in a ration as a substitute for 12 pounds of clover hay, it would be necessary to feed 2½ tons of silage as a substitute for one ton of clover. Therefore 14 tons of silage would furnish as much feed as five and three-fifths tons of clover, and one acre of silage would produce as much feed as one and three-fifth acres of clover. That being the case the acre of silage costing $35.84 would feed as much as one and three-fifths acres of clover hay costing $32.50 per acre.

The comparison of the two kinds of feed using the above figures is as follows:

Cost of one and three-fifths acres of clover hay containing the food value of one acre of silage	$52.00
Cost of producing 14 tons or one acre of silage	35.84
Balance in favor of silage	$16.36

There is still another way to compare the value of silage and clover. If the cost of production of silage is $35.84 for 14 tons the cost for one ton is $2.56. And if 2½ tons of silage is worth as much as clover hay valued at $12.00 then the silage is worth $4.80 per ton leaving a profit over its cost of production of $2.24 per ton. However computed by the acre the silage at $4.80 is worth $67.20, while the clover hay is only worth $42, a difference of $23.20 in favor of silage. H. B. C.

R. N.-Y.—Without disputing these figures, the fact remains that a combination of silage and clover hay will give better dairy results than feeding on either one alone. This has been demonstrated many times, for the cow craves and needs a certain proportion of dry fodder with the silage.

Milk Testing as a Profession.

Will you give me some information regarding the possibilities of milk-testing as a profession, the qualifications necessary, remuneration and chances of employment when efficient? M. M.

Milk-testing as a profession includes both dairy inspection and cow-testing work, and in some cases, advanced registry work also. The qualifications are much the same in any case, although a tester working for an association should be familiar with the feeding and management of dairy cattle as well as sanitary conditions and the testing of the milk itself. Some States require an examination to test the familiarity of the applicant's knowledge with the Babcock test. In any case, it would be well to write to your State College of Agriculture for details. Cow-testing offers a good opening to a young man desiring considerable out of doors work, and either that or dairy inspection work, if faithfully followed up, will prove a good foundation for a better position in dairy lines. A short course in dairying at your agricultural college should give you the necessary instruction and after a couple of years of experience you should be in a position to better yourself considerably. B. B.

Pigs on Witch Grass.

I have about one-quarter of an acre, which was plowed and harrowed late last Fall, which is badly infested with witch grass, and I would like to know if the following plan would be advisable to eliminate it: Plant rape or ruta-baga turnips broadcast, and when sufficiently grown, fence in about one-quarter of the lot and put in one or two Spring pigs, leaving them long enough thoroughly to clean and root up, then move onto a new section and replant first one to be fed on later, and repeat this until the lot has been covered. Pigs to have portable house and fed on grain for balance of ration. Do you consider the plan a good one, and would they eat out the witch grass roots if not fed too much other food? W. O. W.

Boothbay, Me.

The plan suggested is a feasible one, and instead of mixing Dwarf Essex rape and ruta-baga turnips I would prefer Dwarf Essex rape and Sweet clover, using six pounds of the rape and 10 pounds of the Sweet clover per acre. This should not be pastured until the plants are eight or 10 inches high. It would be well to plant the entire area, and let the animals pasture sparingly until August and September at which time they should be turned in and permitted to clean up the crop. It should then be plowed, planted with rye or wheat, and in all probability this treatment will eliminate the weeds. One-quarter of an acre would accommodate about 500 pounds, live weight of shoats, and would supply the bulk of their feed throughout the season. To supplement this feed, ear corn and digester tankage would be more economical, feeding the tankage in a thin slop to the extent of 10% tankage to the amount of corn fed. F. C. M.

A PAIR OF PENNSYLVANIA BUSINESS BERKSHIRES 11 MONTHS OLD; TOTAL WEIGHT 759 POUNDS.

A TOURIST in Scotland came to a wide ferry. It was stormy, and the wind was constantly increasing. The Scottish ferryman agreed to take the tourist across, but told him to wait until he had first taken a "coo" across. When he had returned and started across with the traveller the latter became curious. "Will you tell me why you took the cow over and made me wait?" he asked. "Weel, now," explained the ferryman, "you see the coo were valuable, and I feared th' wind wud increase so th' boat might upset on th' second trip."—London Farm and Home.

AYRSHIRES AT AUCTION.

The first auction sale of dairy cattle ever held in New York City took place May 21 under management of the Fasig-Tipton Co. Ayrshires of excellent quality from the following farms were sold: Ryanogue Farms, Brewster, N. Y.; Lountaka Farms, Morristown, N. J.; and Cliffdale Farms, Poughkeepsie, N. Y.

Ryanogue Gwynette (35568), a two-year-old heifer of exceptional breeding and promise, was bought by F. H. Knox, of Buffalo, N. Y., for $875. Mr. Knox also took Imp. Foulton White Rose (29350) for $425, and Ruberta of Woodhull (26795), $250.

W. F. Spickermann, of Greenwich, Conn., bought Springhill Queen Hugo (31355) $550; Ryanogue Bessie (27682) $275; Imp. Lessnessock Nell (30574) $650; and Ryanogue Friskey (36079) $475.

R. R. Ness, of Howick, Quebec, Can., bought the following six: Imp. Shewalton Beauty, $550; Imp. Ryanogue Peter Pan (13622), $500; Ryanogue Miss Mysie (36080), $200; Imp. Auchenbainzie Primula "21290" (26878), $200; Ryanogue Joan Pan (36860), $125; and Ryanogue Benehan Commander (16415), $75.

Among other sales were: Rosette 2nd (23915), $250, and Imp. Grange Firefly "25688" (27315), $125, to J. W. Lane, St. James, L. I. Ryanogue Killarney, $125; Ryanogue Accountant (16419), $150; Master's Double Cross (37120), $80; and Oak Leaf Brownie (37119), $110, to F. C. Stetson, Sterlington, N. Y. Betty of Hillview (25549), $225, and Ryanogue Challenger (15904), $200, to Wm. Simpson, Cuba, N. Y. Ryanogue Milk Maid (36853), $175; Ryanogue Surprise (15618), $225; Ryanogue Primrose (36847), $235; Ryanogue Hugo's Miss Prim (36851), and Ryanogue Lilac (36848), $150, to M. G. Hershey, Hershey, Pa. Ryanogue Biddy (36866), $110, to W. J. Morris, Trenton, N. J. Imp. Benchan Lizzie "29189" (36069), $325, to H. J. Chisholm, Portchester, N. Y. Ryanogue Victor's Flora (36859), $175, to J. R. Yale, Brewster, N. Y. Imp. Toward Point Dew Drop "28202" (30607), $150; Ryanogue Francis (29338), $200; Imp. Lochland Mysie 4th "24986" (27553), $260; Lenetta Barcheskie (24481), $150, and Orchard Hill Victor Hugo, $175, to Peter Murray, Manomet, Mass. Nora's Emblem (37118), $250, and Imp. Lessensock Maud "25679" (27011), $225, to Fairholm Farm, Newmarket, N. J. Imp. Lanrieston White Lady "29384" (37115), $125, and Imp. Netherhall Brownie 19th (31481), $210, to B. M. Frank, Huntington, N. Y. Master's Rosalie (37117), $260, and Imp. Burnhouses Yellow Bess, 2d, "24567" (27310), $190, to J. B. Wilbur, Manchester, Vt.

Concrete for Milk-room Floor.

I am fitting up a milk room in an outbuilding which has a single floor about two feet from the ground. Would you advise laying an inch of concrete made of Portland cement over this? How should it be mixed, and should it be put on wet or dry boards? Is there any other preparation that would be better?

Stoneham, Mass. J. P. H.

Thin concrete floors an inch or more in thickness are successfully laid over wooden ones, but it is essential that the wood floor should be very rigid as a thin layer of concrete is easily cracked if allowed to spring. Such a floor should be reinforced with close mesh wire netting, and made from a comparatively rich mixture of concrete. Floors in ordinary out buildings are not apt to be suitable for such work, and unless this one is very rigid, or can be made so by supporting the floor joists from underneath, you would probably find it better to remove the old floor and fill up the space beneath with large stones and lay your concrete floor upon that foundation. Ordinarily, this is easily done, and there can then be no question about the success of the job. M. B. D.

Garget.

I have a two-year-old Holstein heifer with a calf nine days old. Before calving her udder was much enlarged and very hard. I gave her salts, put lard and turpentine on udder before and after calving, and gave her saltpeter after; fed her lightly of hay and stalks, milked her about half clean. She gave bloody milk from all teats. I milk her clean now, but milk is a little bloody. Blood settles to bottom of pan. What is the trouble and what should be done? Will the trouble pass away after the udder becomes normal, which is nearly so now? Will it be safe to use the milk?

A. D. W.

Acute congestion of the udder has been present and it led to rupture of small blood vessels, causing the presence of blood in the udder. It would seem that she is gradually recovering as you gave correct treatment. The milk may be used as soon as it is perfectly normal. Foment the udder with hot water three times a day. Massage well each time. At night rub in a mixture of one part of mercurial ointment and two parts of soft soap. Give her a dram of saltpeter twice daily in water. Feed lightly. Keep her off grass for the present. A. S. A.

Breeding an Old Mare.

I have a valuable mare weighing 1,200, coming 26 this Spring. At the ages of 19 and 20 she foaled two perfectly formed and desirable mare colts to a large well-bred Percheron stallion. This Spring I wish to breed her to a trotting horse about her build and temperament. Several local horsemen advise against it on account of the mare's age. She is in good flesh and spirits. I would like the advice of some experienced breeder.

Pennsylvania. M. M. D.

The mare should have been bred from each season after producing a foal at 20 years of age. She may not now conceive if bred, but as she is in good condition and health there should be no particular danger in having her bred, or in the production of a foal. There are many cases on record of successful foaling in a mare of her age. A. S. A.

Nasal Gleet.

I have a mare that has a roaring in the head and sometimes runs freely at the nose. If I feed her on dusty feed she has a bad cough; if she gets wet the roaring is worse. She has been this way five or six years, only gets worse all the time. She is now in foal. Can you tell me what to do for her? W. W. P.

Maryland.

Nasal gleet or chronic catarrh in such cases may be due to glanders, so that the first step should be to have an examination made by a graduate veterinarian. If glanders is not present he may find that the discharge is due to a tumor (polypus) in a nostril, or to a diseased molar tooth, or associated with a collection of pus in a sinus of the skull. These conditions are remediable by operation. Such a case cannot be successfully treated by the owner. A. S. A.

Periodic Ophthalmia.

Could you tell me what ails our horse and suggest a remedy? A few days ago I noticed the tears coming out of his eye, and it was feverish and swollen, especially just above the eyelid. He seems to be losing his sight in that eye.

Ohio. A. F.

This disease (moon blindness) is incurable and results in blindness from cataract after successive attacks. Blindness may be somewhat retarded by bathing the eyes twice daily with a saturated solution of boric acid, applied each time on fresh swabs of absorbent cotton. At time of attack give a dram of iodide of potash in the drinking water night and morning until the attack subsides. At such times also keep the eye covered with a soft cloth to be kept wet with a lotion composed of 10 drops of carbolic acid and half a dram each of sulphate of zinc and fluid extract of belladonna leaves in a quart of soft, cold water. A. S. A.

Thin Mare.

I have a large mare that is due to foal early in June. She is getting very poor, and is losing strength. I am feeding her six quarts of whole oats and a little wheat each day. She does not eat much hay and sometimes leaves her grain. Can you tell me what I can do for her? I am not working her and letting her run out of doors all day. M. J. K.

New York.

Do not feed wheat to a horse. It is highly indigestible to these animals and may be a partial cause of the thin condition. Substitute one-ninth part of wheat bran with the whole oats and add good mixed hay in addition to grass. Have her teeth attended to by a veterinarian who should make sure, by examination, that the colt is not dead and retained. A. S. A.

REMOVING HOG LICE.—Melt lard, not hot enough to burn the hog, and turn on the back from the head to the tail end and it will kill the parasites very quickly. Simple and never fails. E. R. B.

Spavins, Curbs, Etc., Cured
by prompt application of Quinn's Ointment. *Money returned* if you are not satisfied.

Purebred Registered
HOLSTEIN CATTLE
Quantity of production and persistency of milking during long periods are well-known characteristics of Holsteins. Dropping her first calf at about two years old the average cow, if well cared for, will produce from 5,000 to 6,000 pounds of milk in ten months, and she will increase the production every year until, at five years, she will give from 7,000 to 9,000 pounds.
If fed to their ability to digest and assimilate food, many Holsteins will exceed this production.

AILING ANIMALS.

Indigestion.

I have a valuable 1200-pound western gelding which seems very nervous when hitched on a drill or a noisy wagon. He has had several short sick spells, colic, swelled legs, and skin trouble. Now he has scatches. He was fed whole oats, old. The veterinarian advised feeding ground oats, but he keeps rather thin and nervous. He has had some oil meal, stock food and oats. He has never been right in bowels, also gets a cold easily, and scours on the road. Can you prescribe for him? H. F. B.

The nervousness is a matter of temperament, but may improve if the digestion can be remedied. If the horse has a long, weak, washy coupling the scouring is natural under those conditions and will prove incurable. Have the teeth attended to by a veterinarian. Also have the horse clipped if the coat is long and rough. Feed eight parts of whole oats and one part of wheat bran, allowing one and one-fifth pounds per hundred pounds of body weight as a day's ration. Feed a little over one pound of hay per hundred pounds, give one-half of it at the night meal. In the feed night and morning mix a heaping tablespoonful of a mixture of two parts of powdered wood charcoal and one part each of powdered nux, gentian root, saltpeter and fenugreek. A. S. A.

Horse With Worms.

I have a horse that I have doctored for worms three months and have tried everything I have heard of, all to no avail. Could you give me a practical formula? R. W.
New York.

A treatment for worms recommended by the U. S. Bureau of Animal Industry is, in the case of the long round worms, to give twice daily for three or four days a drench composed of turpentine one ounce, linseed oil three ounces, to be followed on the fourth day by a physic of Barbadoes aloes, one ounce. Or santonin, two to four drams with calomel one to two drams, may be given; this dose is not to be repeated but is to be followed in six hours by one quart of linseed oil. For the small pin worms that infest the large bowel, injections into the rectum of infusions, or teas, of quassia chips, a half pound to the gallon of water, once or twice daily for a few days, followed by a physic, are beneficial. Intestinal worms are usually seen in horses that are in poor condition, and part of the treatment is such care and feeding as shall put the horse in condition to keep itself free from these parasites. M. B. D.

Lump on Knee.

1. I have a horse that does not lie down at night to rest and sleep, and then he sleeps in the team when standing. Is there anything to overcome this trouble? 2. Another horse has a lump on his front knee caused by slipping and falling on the barn floor. Is there anything to do for it? F. W. K.
Ohio.

1. Many horses sleep in the standing position and are unable to rise without help if they lie down. The vertebrae of the loins in some of these cases have become united (anchylosed) and rheumatism may be the cause. The horse may lie down if you allow him to occupy a well-bedded box stall. 2. If the lump has been there for a long time it will prove permanent. Clip off the hair and rub in a little oleate of mercury once a day. A. S. A.

Stocked Legs.

I have a mare 12 years old that stocks badly in her hind legs. She works every day. The swelling goes down during the day, but is there again in the morning; standing over Sunday they swell up to the knee. I have cement floor. Is there any danger of big leg? What can be done to dispel the swelling? E. M.

Allow the mare a box stall in the stable and each time she comes in rub her legs dry and then bandage them, from feet to knees and hocks, with flannel. It would be best to have a dirt floor in the stall, and to keep it well bedded with clean straw, or planing-mill shavings or sawdust. Never let her stand for a single day idle in the stable. If there is no work for her to do turn her out in the yard or field, or give her exercise to halter. The swellings will in time become organized and permanent if this treatment is not given. A. S. A.

Foul in Foot.

I have had trouble with my cows having sore feet, and have eight cases now. Six cases are with the hind feet, two with front feet. The foot gets dry and feverish between the claws, then the foot and ankle begin to swell. The foot gradually cracks between the hoof and develops into a running sore. I am using a solution of creolin to wash the sores, but with little success. What is it and what can I do for it? J. C. L.

The disease is not contagious. It is caused by wading in filth and mud or grit, or standing in stagnant water. Do away with such causes. Cleanse the parts perfectly and cut away any undermun or loose horn; then immerse the foot for a few moments in a hot, saturated solution of sulphate of copper. Afterward apply a wad of oakum or cotton saturated in a five per cent. solution of coal tar disinfectant. Renew the latter dressing once daily. Dust with slaked lime as soon as doing well. A. S. A.

Lump in Teat.

I have a cow which has a lump in her teat. She came fresh in April. The lump bothers when milking, the milk comes slowly. Is there anything I can do to take the lump out? A. V. C.
New York.

A veterinarian should be employed to remove the lump with special instruments. If you cannot have this done insert sterilized dilators or teat plugs, between milkings; but these are apt to cause infection and loss of the quarter. In some instances the obstruction has to be cut through in four different directions, by means of a sterilized teat bistoury or slitter. The veterinarian should be entrusted with such work. A. S. A.

LIVE STOCK NOTES AND PRICES.

May 10. Corn 60; wheat 90; oats 35; potatoes 75; hay $10; dairy cows $50 to $80; fat cattle $8 per cwt.; hogs $8.35; hens 12; eggs 17; butter 20; butterfat 23. W. I.
Bourbon, Ind.

Milch cows $60 to $90; cows for killing, fat 12 cents, dressed; calves 10 to 10½; no steers in this country. Milk 20 cents. Pittsburgh 18 net. Butter 32 to 33; eggs 22; apples $1.75; potatoes 90. C. E. S.
Elwood, Pa.

Wheat, per bushel, 70; flour, 100 pounds, $1.15 to $1.20; oats $1; barley $1; potatoes 45; eggs 15; milk, 100 pounds, $1.20; butter, pound, 30; butterfat 28; veal 13½; pork 10; beef, on foot, seven to eight cents; cows $60 to $70; horses from $40 to $200 each; apples, per box, 75. J. G.
Peterson, Ill.

May 13. The prices given are what the farmer receives from local dealers, butchers, or mills, except cows and horses which change hands mostly between farmers. Consumers' prices another story. Horses $100 to $250, according to age, weight, etc.; cows $40 to $125. Dressed beef, straight, 10 to 12; veal 12 to 14; chickens, live, 10 to 12. Butter 23; eggs 15. Wheat 85 to 90; oats 45; corn 60 to 65; rye 70; buckwheat 55 to 60. Hay, Timothy, $10 and $12; clover $8 to $10; straw $6 to $8. Potatoes 70 to 80. W. P. K.
Summerville, Pa.

May 9. Horses are in great demand here this Spring, even cripples bringing $100 at auction. Young Western horses from $175 to $250; cows, ordinary, fresh $50 to $90; high grade $90 to $115; registered (and they are far too few) 125 to $160 for Holstein. The Bucks County Holstein-Friesian Association is of recent organization, and offers some good animals. This is principally a market milk section, going to Philadelphia and Trenton market, four cents a quart at present after paying freight. Spring pigs very scarce and high. We paid $6.50 for seven-weeks-old pigs in April. Dressed pork 11½ cents in March, somewhat lower now. Fowls 18 cents alive, 22 dressed. Potatoes, 90 to $1, average for Winter 85. Little fruit is raised in this section, although several commercial orchards have been recently set, one of 1,700 trees, set by two young graduates of Pennsylvania College. The Spring has been cold and wet but prospects for fruit are excellent. Hay $17 to $18 per ton. Eggs 18 cents a dozen, sold in nearby village at grocers, being six cents below last year. High grade Guernsey butter, which we sell to neighboring farmers, 32, being eight cents below last year's average for April. Not much gardening here, except in lower end of county, near Philadelphia and Trenton. We are 13 miles from latter, and 28 from former. We get fair prices, but poor, high-paid help is the main drawback to farming. Staple crops here are hay, potatoes, corn, wheat and oats, finished products being milk, pork, poultry, eggs and fruit. Very few sons born and bred on the soil on the farms here, because it requires three or four times the capital to stock a farm it did 25 years ago, because they are not satisfied to hang to a scrub cow's tail along with their fathers, and possibly they see the middlemen riding in limousines. Who can blame them for going to the city? We need sound organization in selling produce as well as in buying supplies. Most any novice can grow a crop, but to market it at a profit is a far more serious proposition. Our Grange has started the Keystone Exchange in this State and farmers should coöperate to make it a success. They must organize or be crowded to the wall. I find the most prosperous farmers here, are those who retail their produce in the markets named, or in nearby villages every week, or those who grow hay and potatoes in connection with market milk. The prosperous farmer is one who is not prejudiced against changing a poor method for a better one but still one who is not radical or whimsical. M. C. T.
Bucks Co., Pa.

The Henyard.

Building Up a Poultry Business.

I aim to make my poultry the big end of my business, leading in egg production and taking in the raising of broilers, roasters and possibly baby chicks as side issues. I would prefer to sell a superior class of eggs to a private retail trade. I expect to handle also vegetables and fruit of the same class, but as side issues, fruit consisting of apples, pears, peaches and berries. I desire to work on a system by which I can house, feed, raise my stock and dispose of my products which will return me a reasonable profit. Shall I continue my present style of laying house? (See diagram.) What method shall I adopt as to feeds and feeding? Give formulas for laying mash and scratch food. How can I best raise my stock, i. e., incubation, feeding, free range or confinement? How old can I keep my hens for profit? How shall I mate for my breeding stock? Can I with profit use the trap-nest? Should I expect better results by trap-nesting my breeders and line-breeding or from time to time introduce different blood? As the matter of breed is more or less a personal taste, or liking, I have decided on the R. I. Reds, with an idea of breeding them a trifle heavier. C. C. L.

Experience will doubtless lead you to modify your plans as your business develops, though these seem good for the start. Your type of laying house is an excellent one, and need not be changed unless in building others you see opportunity for improvements. There are various successful methods of feeding, though the one which has come to be adopted by the majority of poultrymen, known as the dry mash method, may be considered the standard. This consists in keeping a mixture of dry ground grains constantly before the fowls in open hoppers, and feeding mixed whole grains in the litter, morning and night. There are many good formulas for the dry mash; the following being used at the Cornell (N. Y.) Station: 60 pounds cornmeal; 60 pounds wheat middlings; 30 pounds wheat bran; 10 pounds Alfalfa meal; 10 pounds oil meal; 50 pounds beef scrap; one pound salt. For the whole grain mixture, they use 60 pounds corn; 60 pounds wheat; 30 pounds oats; and 30 pounds buckwheat; omitting the buckwheat in the Summer. Incubators are a necessity when large numbers of chicks are to be hatched, and the greater the amount of range the chicks can have the better. Individual colony houses for the chicks scattered through the orchard would be my preference, though a long hot-water heated brooder house would save labor, and probably some expense. Young chicks should have both mash and cracked grains as well as meat scrap and sour milk, if the latter is available. For grains I know of nothing better than the "one, two, three mixture," viz., one part pinhead oatmeal, two parts finely cracked corn, and three parts cracked wheat. For the mash (Cornell formula), three parts each cornmeal, wheat middlings, wheat bran and beef scrap, to which one part of bone meal is added. This is fed dry in shallow trays and open hoppers, and is also given as a moist mash from one to three times daily according to their age. Three times daily at from one to two weeks of age; twice daily from two to four weeks, and once daily after four weeks. The same mash is always available, in dry form, to the chicks.

No one can say how long you can keep your fowls at a profit. It has generally been thought that hens should be disposed of after their second year of laying, and this has been the general practice among poultryman; there is a tendency now, however, to question the economy of replacing two-year-old hens and some poultrymen are making the experiment of keeping their stock for three years. In mating breeders you should select for size, vigor and prolificacy, using males from your best layers. To ascertain which these are you may trap-nest, though it is very doubtful if you will find it practicable to do this. The early-laying pullets may be placed by themselves, however, and of these, those that continue laying longest in the fall may safely be considered the best layers. If the best of these are kept through a second Winter without forcing for egg production they will make a superior breeding pen in the Spring. Early laying, early rising, late molting, late retiring, heavy eating, bright-looking, busy hens which lay the color out of their shanks may be considered the best layers, and the most vigorous, active, and most nearly true to the desired type of these should go into the breeding pen. However you select your breeders, whether by trap-nest or otherwise, endeavor to improve your own flock and do not throw away all the gain that you may have made by introducing "new blood" every few years. As you suggest, it would be impossible to answer your questions in full within limits less than a book would afford, but these few hints may be of value to you. Finally, get in touch with your experiment station and learn all that they can teach you. M. B. D.

A Talk About Capons.

What is a good method of feeding capons? I have a flock of 20 S. C. R. I. Reds. Is it proper to keep a feed of grain, two parts corn, two parts wheat, and one part oats before them all the time? They will be marketed when a year old. H. C.

Greenwich, Conn.

Would like to know if it is profitable to caponize Leghorn cockerels? Will they grow large enough to bring a top price, and how long does it take to get their growth with proper care? A. T. L.

New York.

The demand for capons in the large markets comes from after the holiday season until May. The heavier birds are worth the most per pound; thus when six to eight-pound capons are quoted at 28 cents per pound, 10-pound capons would be worth 30 to 32 cents per pound. These are representative wholesale prices in the height of the season. To be grown most profitably they should be of a naturally large variety. Experienced growers use the American or Asiatic breeds or crosses of them. While young and growing fast they should have plenty of range to develop their size as well as to enable them to gather much of their own food. During this period they are voracious feeders and grow very fast. They are usually sold when about eight to 10 months old. It should be the aim of the grower to get them just as large as possible by this age. In fact at 10 months of age well-grown capons should be as large as they ever would be. On general farms, where grass range is available, very good results are obtained by feeding only whole corn from the time they are caponized until they are sent to market. Under confinement, and it is doubtful if capons can be raised profitable for the open market under such conditions, they should be given a moist mash once a day of equal parts of cornmeal, wheat middlings and ground oats with ten per cent. of meat scraps. Twice a day they may be given a grain feed of equal parts of corn and oats. Skim-milk is an excellent food for them and can be given in the mash and also in the thick sour form alone. Capons fatten very easily, and many growers make no change in the feeding for finishing them off. They may, however, be penned up and given the mash as described twice a day and one feed of whole corn at night. In feeding any kind of poultry or stock for fattening care should be taken that only as much food be given each time as they will consume in a short time, in this case 10 minutes. The feeding troughs should be capacious enough so that all the fowls can get at the food at the same time, otherwise the larger and stronger will get the lion's share.

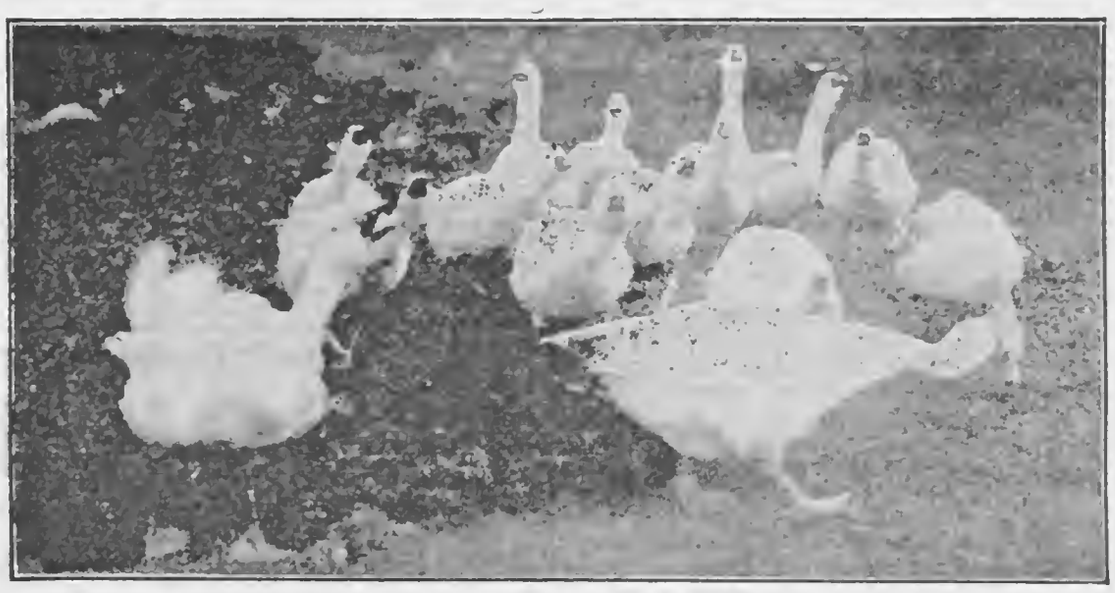
Capons are plucked in a special manner for the large markets, and if one is to dispose of some in such a place one should become familiar with the special preparation. The smaller breeds are a failure as a commercial proposition in capon production, although they can be caponized and will make very desirable six-pound capons in six or seven months. For home use some people do this with Leghorns and other of this class of breeds. I believe this may be a very advisable habit where only Leghorns are kept and where nice roasting chickens are desired. By caponizing they remain as tender as broilers and keep on growing up to roasting size. A. L. C.

Gas-heated Incubators.

What is your opinion of running an incubator with artificial gas? Will the incubator receive as much oxygen by using gas as it does with an oil lamp, or is there any difference? As far as being safe, I think one is as safe as the other, but my landlord doesn't take the same view, therefore I am compelled to run my incubator with gas, if I run it at all. I have 450 eggs in the incubator now, and I do not wish to discontinue running it. I have tested out for the first time, and I have lost but 40 out of the 450 eggs. C. S. D.

New York.

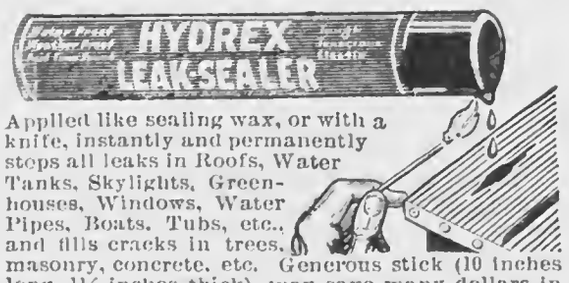
Next to electricity, gas is the best source of heat for incubators, and practically all the exact incubators used in laboratories are so heated. When used for hen or duck eggs care should be taken that there are no gas leaks, and that all gases from the flame are carried to a chimney or led out doors. With a "hot air" incubator especial care should be used to see that the air system is airtight; in hot water machines there is less chance of fumes entering the egg chamber. There is going to be enough oxygen in any event. The danger is from unburned gas and partly burned gas poisoning the eggs, and this danger is greater than with oil. On the other hand, the heat is much more constant, especially if a gas thermostat or heat regulator is used. These can be purchased from dealers in laboratory supplies, but some little ingenuity would have to be used in fitting them to an ordinary incubator. Once working, however, they will hold the temperature within 0.1 deg. Fhr. regardless of the gas pressure. If the best grade of tube is used gas is far safer, from the fire risk standpoint, than oil.



THEY LOOK HOSTILE, BUT THEY MAKE CHEAP MEAT.

First City Man: "How are you getting on with your poultry venture?" Second ditto: "I've been swindled. I bought three incubators of different makes, and not one of them has laid an egg yet!"—Woman's Journal.

Child visitor: "Mrs. Jones, please can I go upstairs in your room and look in your closet?" Hostess: "Why, Willie, what do you want in my closet?" Child Visitor: "I want to see the skeleton pa says you've got there."—Baltimore American.



Applied like sealing wax, or with a knife, instantly and permanently stops all leaks in Roofs, Water Tanks, Skylights, Greenhouses, Windows, Water Pipes, Boats, Tubs, etc., and fills cracks in trees, masonry, concrete, etc. Generous stick (10 inches long, 1½ inches thick), may save many dollars in emergency, and costs but 25 cents.

Ask your dealer, or we will send postpaid at this price. Agents wanted.

An Important Shaving Necessity

Next to a good razor nothing is as important for shaving as

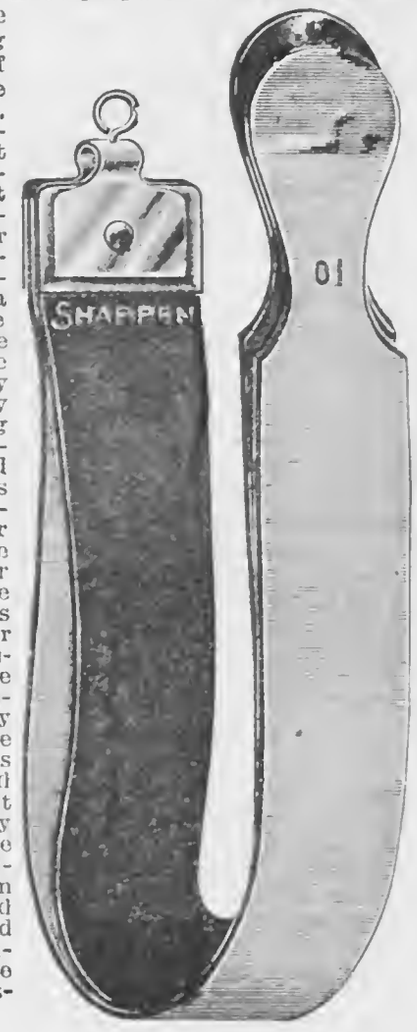
A Good Razor Strop

If you have a good razor and it is not giving good results the fault may be with the strop. We can furnish you a strop, that will keep your razor in good condition, by doing some subscription work for us. We will send the strop, described below, for

One New Yearly Subscription or Three Renewal Subscriptions

(One of these may be a renewal of your own subscription for one year)

This strop is 22 inches long and 2 inches wide. It consists of two separate strops—the sharpening strop is of prepared calf skin of best quality; the finishing strop is of genuine horse hide, the two different leathers being the best known combination for sharpening and finishing a razor. The two separate strops are securely fastened by strong nickel-plated swivel. It is guaranteed never to become hard or glossy. The strop is ready for service without the use of preparation of any kind. The strop is stamped R. N.-Y.; it is made by one of the most reliable firms in the United States and is guaranteed to give entire satisfaction.



Your neighbor needs the Rural New-Yorker—if he is not a reader secure his subscription—if he is a subscriber secure his renewal

The Henyard.

Feeding at the California Contest.

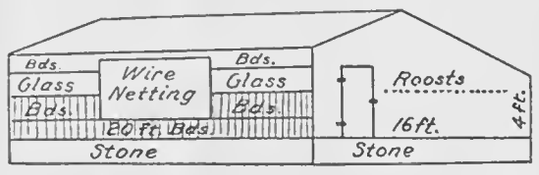
Since we gave that report of the California laying contest, on page 553, there have been requests for the plan followed in feeding. At this contest the hens were kept in one large house—there were no outside runs and a poor chance for exercise. Under such conditions there would naturally be a different system of feeding from where the hens were out doors part of the time. The hens were fed as follows:

"Birds were fed twice daily, dry mash in the evening about 1½ hour before sundown, wheat, cracked corn and oats in the morning, green feed at noon; grit and shells in the straw. We made birds scratch in the morning because if exercised at night birds take cold after going to roost, especially during molt. The mash was composed as follows: For 50 pounds—wheat 13½ pounds, middlings 20 pounds, bran 7½ pounds, Soy beans 2½, meat scraps four and ground bone 2½. During molt I feed five pounds of meat scraps, instead of four, and added to the mash 5% of sand. The 460 birds would consume about 45 pounds of the above mixture daily. No two pens consumed alike. The same pen did not consume alike every week. The consumption varied with the production. The grain was fed in the straw, 26 quarts to the house, fed in this proportion, three of wheat, one cracked corn, one oats. In midwinter birds were costing us about 12 cents per month (11¾), the larger breeds costing one-fourth more than the Leghorns."

A Satisfactory Concrete Henhouse.

[There has been some criticism of concrete poultry houses. Therefore we are glad to print a description of such a house that has made good.]

The henhouse has an eight-inch wall, gable roofed. It is 40 feet long, 14⅓ feet wide; gables carried up with cement and shingled roof, using 26 bunches of shingles. It was built in Fall, 1913, and has housed 124 Brown Leghorns, free from disease, with no loss at all; perfectly dry and practically no smell whatever. There



CONCRETE HENHOUSE.

are two pens, 17 feet; feed room six feet (scant); all walls eight inches; side walls 6½ feet with 2x6-inch plank wall plate overhung two inches, with eight-inch spikes driven down into cement wall. Foundation was dug 2½ feet deep and filled with broken field stone, somewhat wider than wall, or 12 to 14 inches. We used 2x12-inch plank for form boards, building six inches, then reinforcing by using heavy fence wire all around house in the wall, thus making a continuous bond. After finishing one foot of height we left the forms as filled for one or two days. When forms were raised another foot for building until sides and ends were complete. The window and door forms were placed as needed of 2x6-inch, and large enough to be re-cased.

For the floor we leveled off the dirt thrown in from the foundation with a top-dressing of fine sand and cement wet down, then old tar paper. All over floor, two and three-ply; then 1½ inches of good cement mortar, well troweled, smooth. For ventilation we used 2x4-inch on end on north side of house two feet centers and nailed at top to floor joists, leaving the bottom open for 18 inches, steel lath or wooden lath for nailing on face side to leave four inches dead air space chimney, the whole length of north side. One inch of good wall fibre plaster on the lath makes the air chambers complete.

Over floor joists we used three-inch strips, three inches apart, with six inches of straw on upper floor. In each gable we made an opening 24x28 inches with a trap door hinged at top to be let down outside in extremely cold weather. The west door was made double, on inside and outside door. On south side we placed five windows of 12 lights 7x9 inches, two sash, to raise or lower, with frame of wire screen inside. We used 6x8-inch wide paddles for outside paddle finish to house.

Side walls should be carried up with cement flush with top side of rafters even over a part of the plank roof plate. One can use as many extra cloth window sash and doors as circumstances may require. We have our own gravel and sand pits close at hand, so this is a cheap house to build. Rafters and floor joists were nailed together as put up, and spiked to plank roof-plate. We used six or eight inches of straw for floor covering, so the hens' feed did not come in contact with cement. Roosts are along north side of house, with nest boxes under, and all easily removable. Center partition was boarded up 2½ feet, remainder wire screen. Doors are all placed near south side, so as to disturb fowls as little as possible. I have built a number of houses, but this is by far the best. A 16 or 18-foot wide house would house 200 fowls easily, in this climate. We usually shut up stock December 1 and keep there until April 1. F. M. P.

Scipioville, N. Y.

Wrynecked Pullet.

I have a pullet that has wryneck; she is nine months old in good condition, except that her neck is twisted upside down and she cannot pick up her food, or drink unless held in position so that she can locate it. I have given her salts and olive oil at different times, but it has not cured her. How can I relieve her?

Cresskill, N. J. N. E. B.

If this pullet's head and neck are permanently fixed in the position you describe, I am at loss to account for it or suggest a remedy. Twisting of the head and neck in this way is usually ascribed to vertigo from some brain disturbance, and this, in turn, is apt to be caused by intestinal irritation from indigestion or the presence of parasites. At a venture, I should give this pullet one or two grains of calomel in tablet form and after a few hours follow it with about two teaspoonfuls of castor oil. This would clear out the digestive tract and might remove the source of irritation; if it did not, I should conclude that the pullet had some permanent brain trouble and kill her. M. B. D.

Cholera; Diarrhœa in Chicks.

1. My hens are getting sick and I have already lost four of them. They start by losing appetite, and after the first day they mope around and the comb turns dark. Most of them have the diarrhœa, soft and tinged with yellow. I keep Barred Rocks and feed scratch food in litter, also give them dry mash in hoppers before them all the time. 2. Can you tell me a cure for diarrhœa in young chicks? G. F.

Amston, Conn.

1. This may be cholera, though not of a very malignant type, and it will be best to guard against its further spread by removing promptly from the flock all birds that show signs of sickness and burning or burying deeply all carcasses of those dying from the disease. The poultry house and utensils used in it should be cleaned and disinfected, the former by whitewashing with lime wash containing four ounces of crude carbolic acid to the gallon, and the latter by cleaning with *boiling* water. No moldy or tainted food should be given the fowls, and their quarters should be kept in a generally clean and sanitary condition.

2. Sour milk fed in abundance to young chicks is a preventive of some forms of diarrhœa caused by germs, but I know of no remedy of any great value for the diarrhœal diseases when they have once become established. Hatching from only healthy and vigorous stock and raising the chicks in quarters and upon ground not contaminated by others that have been sick are the essential methods of preventing diarrhœa, aside from proper feeding. A sick chicken should be killed, not cured, and diarrhœa should be prevented rather than perpetuated by keeping sick fowls about. M. B. D.

Eating Shingle Nails and Tacks.

We have just had the following experience, which may be worth noting in your poultry department. We placed 1,500 White Leghorn baby chicks in new brooder house about a month ago. The loss was very few until 10 days ago, many apparently full-sized healthy chicks began to drop their wings, quit eating and die. We at once commenced to open the dead bodies and found our birds had been swallowing shingle nails and sometimes four-penny nails which had been dropped around the building. We have opened 26 and found a nail in the gizzard of each and at last a dozen others still alive show similar symptoms. Of course we shall not be guilty of dropping nails around in the future.

California. W. H. MACY.

The Henyard.

THE EGG-LAYING CONTEST.

The twenty-eighth week shows a further gain of 91 eggs, 3,649 being laid during the week. The highest number laid during this contest was in the twenty-fifth week, when 3,682 were produced.

Leghorns make the high scores this week, Tom Barron's White Leghorns taking first place with a score of 61. This is a high record; it is an average of over six eggs in seven days for every hen in the pen. I wrote Mr. Barron some time ago asking why his Leghorns were making such a poor showing compared with former years. His reply was, "Those birds are bred right; they will show up bye and bye." He seemed to have perfect confidence in what the *breeding* would compel those birds to do. His White Wyandottes are now 293 eggs ahead of his White Leghorns, owing in great measure to the splendid start the former made, while the Leghorns laid very poorly at first, but lately the Leghorns are steadily reducing that difference and undoubtedly will make a good showing before the contest closes.

Marwood Poultry Farm's White Leghorns tie with Wolverine Poultry Farm's Buff Leghorns for second place, each pen scoring 59. Windsweep Farm takes third place with a record of 56, and P. G. Platt is fourth with a score of 55. Pen number 43 of Storrs Agricultural Station laid 54, Francis F. Lincoln's pen laid 54, and Mrs. K. E. Woodruff's pen laid 54. All the above are White Leghorns. Below are the week's record and the totals:

GEO. A. COSGROVE.

Those English Wyandottes.

IT was with much interest I read what THE R. N.-Y. had to say in regard to the Barron Wyandottes. It seems to me Judge Card, you and others have missed the main point. I have been a breeder of Leghorns for years and Wyandottes for 18 years. The first glance I gave the group of Barron Wyandottes, on page 713, I took them for large Leghorns, then I read the inscription under, stating they were Wyandottes. I have a very strong glass and using this I enlarged the birds a half, and am positive by their shape, hardiness of feather and rather whip tails, also shape of combs, that these 10 females are the result of a cross of either Leghorn or White Minorca blood. That Barron would have extra layers from such a cross of Wyandottes, Leghorn or Minorca most breeders know. This would not place Mr. Barron in the ranks of expert breeders, for the reason that any number of amateurs have made just such crosses with same results. It is the contention of many well-known breeders that these cross-bred pullets if bred to will not produce young that will anywhere near equal in egg yield the original cross-breeds. So in order to continue the high yield you must each year make the same cross. The cut of ideal female of standard does not have the approval of the best Wyandotte breeders. Mr. A. G. Duston wrote me he was not breeding to this standard, and considered the 1910 standard cut nearer correct.

That high-class American Standard White Wyandottes are grand layers I have proven to my own satisfaction at least. I purchased a trio of White Wyandottes, cockerel and two pullets, and two weeks later another pullet, the three pullets laid over 200 eggs each in their pullet year. They were only six weeks in the molt and starting to lay. Two of these are laying equally as well as during their first season, and bid fair to go to the 200 mark as two-year-olds. I am keeping their record and setting all their eggs, the third one has wanted to sit twice, but she will go to 130 for second year. And these are high-class birds, for which I paid $50 for the trio and $12.50 for third pullet. I did not ask for layers, I asked for best exhibition quality they could send for the price.

New York. W. W. CARMAN.

R. N.-Y.—If any small boy can breed such layers as these English Wyandottes show themselves to be the wonder to us is why the larger boys have not done it before, and proved their ability at one of the egg contests. At both Storrs and at Thorndale, Pa., these English Wyandottes lead the crowd, and we understand they are pedigreed birds with records of several years of [illegible] ted breeding.

Hen Versus Hawk.

W. H. D., Maryland, asks how to catch the hawk. I will give a plan that has always worked well here; how it will work on Maryland hawks I cannot tell. Take some sticks about two feet long, sharpen them at one end, drive them into the ground, and make a circular pen about two feet in diameter, a small opening on one side. Cover the top with hen wire. Place a chicken in the pen, put a steel trap in the opening, and several traps on the ground around the pen. The hawk will light on the ground and walk around the pen, and is almost sure to be caught. If you put a live chicken in the pen, close the opening on the side with wire netting so the chicken cannot get out. Make the pen out in a field some distance from the house so the hawks will come and not be afraid to stay there until they are caught. The pen is sometimes made with a little alleyway leading up to the opening on the side. Place the trap in this.

New York. T. F. H.

"What uncleanly people they seem to be out West!" said Mrs. De Lite. "Here is a case of a man starting to clean out a town, and they actually shot him!"—Credit Lost.

The VIBERT REDS

A flock of deep glowing and *brilliant cherry to mahogany red* to the skin rose and single comb Rhode Island Reds, famous for being *the heaviest-laying trapnested flock* of the breed in existence. Long-backed, low-tailed birds, hatched and raised by hens only on absolutely free range in open-front colony houses wide open all winter. A plant on which *roup and white diarrhœa are entirely unknown.*

Highly fertile, strong eggs for hatching the year round. Chicks in small lots from specially selected eggs. Cockerels from trapnested hens of high laying rates. Breeding pens, trios, and utility stock for sale at reduced Spring prices—

all from

THE HEAVIEST-LAYING REDS IN AMERICA

FOR SALE—Choice Three-band Italian Queens. Tested—$2; untested, after June 1—$1. Write for booklet. W. K. Rockwell, Bloomfield, Conn.

QUEEN BEES—Now is the time to get gentle hustling bees and more gilt-edged honey by introducing one of my thoroughbred Italian queens. Send $1. for laying queen with full instructions. Circular free. R. A. NUSBAUM, Duncan Falls, Ohio

Mammoth Pekin Ducks Eggs 11 for $1

MAUDE PERKINS, Ocean View Farm, Newburyport, Mass.

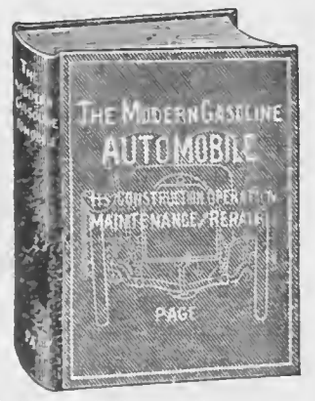
CHICKS—$10, hundred. S. C. Leghorns. Hatch every week. Hatched to live. Guaran-Safe Delivery. G. ROUTZAHN, BIGLERVILLE, PA.

Superior Strains Poultry, Eggs, Fancy Pigeons; large squabbers specialty; Homers wanted. POULTRY-PIGEON FARM, Marietta, Pa.

DUCKLINGS, GUINEA CHICKS, LEGHORNS, etc.; hatching eggs all kinds; free circular. Tel. 98-2. F. S. KEITH, EASTON, MASS.

MODERN GASOLINE AUTOMOBILE.

Its construction, operation, maintenance and repairs. By Victor W. Page. 6 x 9. Cl. 693 pp. Over 400 ills.



It gives up-to-date information on the construction, care and operation of the gasoline automobile, including breakdowns, and troubles of every description, with their proper remedy. The book is clearly and concisely written, and tells just what to do and how to do it under all circumstances. Every illustration in the book has been specially drawn by the author, and shows details of every part of the machine.

THE LADY OR THE SILO.

[We often print articles which give the unpopular side of a subject. Here is one on silos. Personally we believe a good silo is a great aid to the dairymen. Yet this man puts up an argument which is entitled to consideration.]

I note on page 310 that the question has not yet been settled as to whether a woman 60 years of age should climb to the top of a stave silo and throw down silage to feed cows. I say emphatically, no! For no young man, no matter how pressed with work, should ask his mother or his wife to do any such thing. The average farmer—and no doubt this boy will also plead guilty—wastes each day ample time to get out sufficient silage to feed 25 cows twice, at best only a 15-minute job. Many an Eastern farmer without even a thought of the value of time will lean against the wheel of a neighbor's buggy or the door frame of the grain store long enough not only to get out his silage but also to curry his horses and groom his cows thoroughly. It is a shame and a disgrace to let a herd of dairy cattle go from November to May untouched by brush or card, and covered with filth. If done daily it will not require two minutes per animal to keep them in fine order.

But to return to our subject, the silo. After this young man has got out the silage—which, by the way, should always be fed after milking, if the cattle and barn are clean—the housework not pressing and the woman a lover of animals, perhaps the mother might do the milking; and I will warrant that she will get more milk, and that the cows will have a better time than they would with any man about. At the risk of being burned at the stake as a heretic, I tell this young man he does not need a silo, and I venture the assertion first advanced just 30 years ago by the veteran breeder, William Crozier, that the silo has no permanent place in American agriculture. The silo has no stronger advocate than Frank Sherman Peer, and yet he admits that it is nothing to agriculture as compared with the soiling of cattle with Summer green feed.

Massachusetts was the original home of the silo in the United States. It was in Billerica about 1879, that Dr. Bailey built the first one. Yet Massachusetts is gradually abandoning them. For miles around my home are farms fitted with silos which are no longer used. Just to quote one case in point, the late George Freeman of Shrewsbury was one of the "old school" of farmers, keen, thorough and successful. He built himself a very fine silo at a cost of $500, and this he filled on a few occasions. But he soon found he could put his silage land into other crops, and with the money he actually paid out for silo filling buy all the extra haled hay he needed. Here in Massachusetts it is useless to figure on much less than a dollar per ton merely to get the corn into the silo, and on occasions when the "September gales" broke and twisted the corn so that the binder could not be used, the cost would easily mount to $1.50 per ton. It may be set down as an axiom that in this State every good man has some steady work, so that to get together a gang of laborers for silo filling means the payment of 20 cents an hour to incompetent and worthless help. Then add $5 per day for nine hours work of double teams and $3.50 for single teams, and up goes the tonnage cost. The cost figured in the foregoing presupposes the hiring of a cutter and engine, but makes no allowance for the work done by the owner's own men and horses.

Then again, the farm where silage is grown often decreases in fertility, for on account of the short haul, some field near the barn is chosen for the crop, and the constant applying to this field of most of the Winter's manure robs the outlying fields of a fertility that might be theirs through a judicious system of rotation. There is still another objection that one seldom hears mentioned, and that is, the number of times some cow in the herd goes "off feed" through moldy silage. No matter how good the silo or how nice the silage there will be moldy spots, either because the corn was too dry or improperly mixed, or even because some portions were tramped too much. This mold, white, blue, red, pink or green (and I have seen all these colors) is poison to a cow, and I have known careful feeders to throw out by hand any mold they found. Under a proper system of dry Winter feeding with either beet pulp, or plenty of bran or linseed, the cows are never "off feed." If the young farmer will plant some small-stalked variety of flint corn he will have part of the grain ration for his cows, horses, hens and hogs, his cows will eat most of the fodder without cutting, and the residue can be used for horse bedding. Better still, all the work from start to finish can be done by the farm's regular crew. Of course there are farms, heavily stocked, where the silo works well. I know of one farm where 100 cows are kept on 60 acres of land by buying some hay and filling four or five silos. But this farmer has plenty of men, horses, and tools to do most of the work himself.

At some time in their lives most farmers get the silo fever. Some resist it and some succumb. The writer had it so badly that it cost $1,500 to cure him. He built the first stave silo in this town 14 years ago at a cost of $400 and later spent $117 more for a cutter and carrier. (We already had steam engine.) Then for 10 years he filled this silo religiously at the cost of a thousand dollars, and fed the product to 25 milking cows. But the best thing he ever did was when at the solicitation of his wife, he tore the silo to pieces and converted it into a cornerib.

Massachusetts. HENRY G. MANSFIELD.

Ham Sandwich for Cattle.

What is gained by planting sunflowers or Soy beans in corn for silage and how is the seed mixed?

In theory using the sunflowers or beans is like putting the meat into the sandwich. Corn represents the bread and butter containing chiefly the food elements which make fat but are somewhat lacking in the elements which make bone and muscle. These elements are supplied in greater amount by the sunflower and beans. Thus the theory is that when mixed with the corn these supply the "meat in the sandwich." A few farmers carry out this plan but most of them prefer to cut the beans, cure as hay and feed them separately.

Dairy Ration.

I want a balanced grain ration for my cows of the following feeds: Ground corn with cob, cottonseed meal, and middlings. J. H.

You do not state what hay is available but we take it that silage and corn fodder or some mixed hay may be used. In this case the mixture you are using is far too low in protein. It would be better to mix three parts of corn and cob meal, three parts of wheat middlings, two parts bran, and two parts cottonseed meal.

G. E. W.

Turnips or Mangels.

Could I sow Cow-horn turnips with my cover crops, which are either rye and Crimson clover or rye alone, and feed them as succulent food for cows the coming Winter? Would I get better results by sowing mangels? What is the relative value of Cow-horn turnips as compared with mangels? J. H.

Cow-horn turnips are often sown with rye and Crimson clover for stock, particularly sheep. Two pounds to the acre is plenty and can be mixed with the Crimson clover seed and sown with it. Their especial value lies in the saving of labor and the use of land, and they are easier fed by turning the stock into the field than by pulling and storing. One trouble about sowing them with Crimson clover is that unless they are sown fairly early they will not make sufficient growth before frost comes, so that enough of them are large enough to be worth pulling. They are not as valuable as mangels as a feed for dairy cows, and are of more use to sheep in the field than to cows since a sheep can get closer and eat the turnip large or small right out of the ground while a cow gets only the benefit of the top and the root of the larger turnips. They are certainly better than no roots at all, and where you cannot make the mangel crop a special feature, Cow-horn turnips are certainly a good crop to have on the side. As a cheap root supply for sheep I know nothing better. R. B.

"Hollow Tail."

My bull has what we call hollow tail. One of my neighbors told me he had one affected the same way last Fall, and when he had his cattle dishorned he had the sick one dishorned also, and found nothing in his hornes; they were hollow. He then examined his tail and found that the same way. He cut the tail open and put salt and pepper in it and the animal has been doing better ever since. I examined my bull's tail and found he had about two inches hollow. I treated him and he has been improving since. A stock man told me I should blister him back of his head. Do you think I should do the blistering or not? I will watch him for tuberculosis in the meanwhile.

Virginia. J. F. J.

The horns of all adult cattle are hollow and there is no such disease as "hollow tail" or "wolf in the tail." These are myths, handed down from the dark ages of barbarism when poor old women were burned at the stake as witches, and they should be abandoned by all intelligent people, just as such folk no longer believe in the alleged influence of the signs of the zodiac. The soft place in the bull's tail was caused by the tail becoming caught on a snag and yanked loose. The condition has nothing whatever to do with the disease present, and such disease often affects cows that have no horns, or that have lost their tails. Better follow the advice we gave you previously. A. S. A.

Fits.

I have a cow that is subject to fits at certain times when she is on full feed of grass, but on dry feed, such as hay and stalks, she is not bothered with them. She will be eating when suddenly she begins to shake and stagger sidewise, sometimes she falls flat and then again she will keep her feet and it may be several days before she has another attack. When she falls she gets right up on her feet and begins eating. Can you tell me what is the matter? C. W. F.

New York.

This cow has something wrong with her heart, or the jugular veins, so that she suffers from rush of blood to the head when grazing. Better feed her green feed from a rack and keep her off grass. If the trouble continues she should go to the butcher, as there is no cure. A. S. A.

A YOUNG man who needed false teeth wrote to a dentist, ordering a set as follows: "My mouth is three inches acrost, five eighths inches threw the jaw. Some hummocky on the edge. Shaped like a hoss-shew, toe forward. If you want me to be more particular I shall have to come thar."—Sacred Heart Review.

15.95 AND UPWARD ON TRIAL.

AMERICAN CREAM SEPARATOR

A SOLID PROPOSITION to send fully guaranteed, a new, well made, easy running, perfect skimming separator for $15.95. Skims warm or cold milk; making heavy or light cream. The bowl is a sanitary marvel, easily cleaned.

Absolutely on Approval.

Gears thoroughly protected. Different from this picture, which illustrates our large capacity machines. Western orders filled from Western points. Whether your dairy is large or small write for our handsome free catalog. Address:

AMERICAN SEPARATOR CO. Box 1075 BAINBRIDGE, N. Y.

You apply Sirenia Oil with a cloth

Sirenia Oil keeps flies from Cattle and Horses; fleas from Hogs and Dogs; lice from Poultry; ticks from Sheep. It heals sores and scratches. Sirenia Oil is the product of pure oils, will not blister, and is harmless for external use. You apply it with a cloth—you don't need to buy a sprayer to use it.

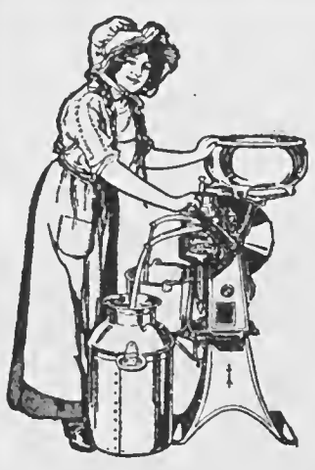
YOUR COW cannot fight flies and produce the milk she ought.

Ask your dealer for a dollar can. Just ask him for "Sirenia Oil," and do not buy a substitute. If he doesn't handle, send us his name and a one dollar bill and we will send a one dollar can, postpaid.

We will refund your money if not satisfied.

Send a dollar now; or write us a card for the endorsements of users who wouldn't be without it.

UNITED STATES WHIP CO.
Westfield, Mass.



SEEING the Difference BETWEEN THE DE LAVAL AND OTHER Cream Separators

IT DOESN'T TAKE AN EXPERT knowledge of mechanics or a long working test to tell the difference between the De Laval and other cream separators.

ON THE CONTRARY, WITH A 1914 De Laval machine placed beside any other separator the difference is apparent at first sight to the man who never saw a separator before.

IF HE WILL THEN TAKE FIVE minutes to compare the separating bowl construction; the size, material and finish of the working parts, particularly those subject to wear and requiring to be occasionally taken apart and put together; the manner of oiling, and everything which enters into the design and construction of a separator as a simple durable machine, he will still further *see the difference*.

IF HE WILL GO A STEP FARther and turn the cranks of the two machines side by side for half an hour, particularly running milk or water through the bowl, he will see still more difference.

AND IF HE WILL TAKE THE two machines home, as every De Laval agent will be glad to have him do, and run them side by side in practical use, the De Laval one day and the other machine the next, for a couple of weeks, he will see still greater difference in everything that enters into cream separator practicability and usefulness.

THE MAN WHO TAKES EVEN the first step indicated in seeing for himself the differenee between the De Laval and other cream separators doesn't put his money into any other machine one time in a thousand.

THE COMPARATIVELY FEW buyers of other separators are those who merely read printed matter claims or listen to the argument of some dealer working for a commission, and who do not think it worth while to *see the difference* for themselves.

THE WISE BUYER OF A CREAM separator today does see this difference when buying his *first* separator, while the unwise or careless one usually finds it worth while to do so when he comes to buy a *second* cream separator a year or two later.

EVERY DE LAVAL AGENT CONsiders it a privilege to show the difference between the De Laval and other separators, and to afford every prospective buyer the opportunity to try out and prove the difference to his own satisfaction, if on first examination he feels the slightest doubt about it.

THAT'S THE REASON WHY four buyers out of five are buying De Laval Cream Separators in 1914, and why the use of De Laval machines will, before long, be nearly as universal on the farm as already is the creamery and milk plant use of power or factory separators.

The De Laval Separator Co., 165 Broadway, New York, 29 E. Madison St., Chicago

50,000 BRANCHES AND LOCAL AGENCIES THE WORLD OVER

EVENTS OF THE WEEK.

DOMESTIC.—May 14, C. S. Mellen, former president of the New York, New Haven & Hartford Railroad, testified before the Interstate Commerce Commission as to the financial deals of that road, which resulted in heavy loss to the stockholders. He gave the name of former Police Inspector Thomas F. Byrnes, of New York, as the distributor of a $1,200,000 "slush fund" with which the New Haven railroad expected to purchase enough influence to modify to its satisfaction the franchise held by the New York, Westchester & Boston Railway. In his testimony, May 19, Mr. Mellen declared that the "Westchester deal," in which more than $11 000,000 of the New Haven's money was expended, was managed by the late J. P. Morgan and William Rockefeller, but chiefly the former. Through Mr. Mellen's testimony it became apparent that the Billard transaction, through which the New Haven apparently lost $2,700,000, was put through for the purpose of avoiding a Massachusetts law. He referred to various political influences consulted, including the Administration then at Washington.

Ten men, most of them chemists, were killed by the explosion of acid and chemicals in the mixing room of the Mexican Crude Rubber Company, at Detroit, Mich., May 15. The company manufactured imitation rubber, and it is understood that ether and other explosives were used in large quantities.

Captain Edward F. Carson, Troop A, Colorado National Guard, admitted on the witness stand before the court-martial at Denver, May 18, that the soldiers looted the Ludlow tent colony on the night the colony was burned, causing the death of two women and eleven children. Carson added that he saw soldiers and civilians bearing away all kinds of property. He saw soldiers carrying off suits of clothes, miscellaneous clothing, umbrellas, jewelry, blankets and grips and satchels filled with all sorts of stuff belonging to the strikers. Even trunks were taken.

Twenty firemen were overcome by acid fumes May 18 in fighting a fire which destroyed the six-story brick building at 463 Greenwich street, New York. The loss is estimated at $150,000. Fumes from muriatic acid stored in the building trebled the difficulties of the fire fighters.

The trial of Becker, formerly police lieutenant, for the murder of the gambler Rosenthal in New York, still continued May 18-20 to bring out testimony damaging to the defense, the widow of one of the executed gunmen being a big witness for the prosecution.

May 19, there were serious forest fires in 19 counties of Michigan; 5,000 men were out fighting them. Iron River was reported wiped out by the flames.

After 14 days of terrible suffering in an open boat, five survivors of the freight steamer Columbian were picked up in the North Atlantic May 17 by the United States revenue cutter Seneca. One died at the moment of rescue. Eleven others of the boat's crew, which left the Columbian when she was burned just south of Sable Island on May 3, succumbed in the meanwhile to injuries and privations, and their bodies had been cast overboard. The death roll of the lost freighter now stands at fifteen. The survivors had lived on only a few ship's biscuits and a cask of water, which had long since been exhausted.

Fairbanks, Alaska, cabled May 17 that Circle City, Eagle City and scores of woodchoppers' and mining camps with many native villages along the Yukon above Fort Yukon have been destroyed by the worst flood in the history of the north. Flood marks on the Yukon show that water in the past rose more than a hundred feet when ice jammed in the canyons. Circle City and Eagle City are only thirty feet above the Yukon's normal level.

FARM AND GARDEN.—The greatest tulip exhibit ever possible anywhere outside Holland will be a part of the national exhibit of the Netherlands at the Panama-Pacific International Exposition at San Francisco in 1915. Two acres will be devoted to the tulip beds.

The test case of Ralph Miller, county treasurer, versus the George H. Mellen Co., of Springfield, Ohio, has been assigned for hearing May 18 in the Court of Appeals at Springfield. This is the case which is to determine whether or not the growing crops in the greenhouses and nurseries are assessable for taxation. A decision adverse to the trade interests has been given in the lower court, and the case has been carried up by the Springfield Florists' Club, with the aid of cash subscriptions by many other florists through the State. Able counsel has been engaged and a vigorous defense has been prepared, as the outcome will be of far-reaching importance to the florists' trade.

The Summer meeting of the State Horticultural Association of Pennsylvania will be held at State College, Pa., June 17 and 18. The Association will be the guests of the Department of Horticulture and Experimental Pomology. At that time the experimental plats on the college farm will be in splendid shape and will afford interesting studies to all who are interested in experimental fertilizer work. The cover-crop and fertilizer work in the College Experimental Orchard will at that time show up the growth which each treatment is producing. A trip over the entire plant of the college will be arranged. Dean Watts, M. G. Kains, Professor-elect of Horticulture; Dr. J. P. Stewart and Professor H. A. Surface of the State Department of Agriculture, and others will speak at the meetings.

MEXICO.—The United States will permit the Constitutionalists to use Tampico for the purpose of getting war supplies to carry on the fight against Huerta. * * * The peace conference between representatives of the United States, President Huerta and the A. B. C. envoys began May 20 at Niagara Falls, Ont. It is believed that one month will be occupied in thrashing out the various suggestions from delegates looking to the avoidance of war. * * * Rebel forces are reported to have dashed into San Luis Potosi and seized the main plaza of the city, routing the garrison with heavy losses. * * * Belief that United States Consul John R. Silliman has been killed by the Federals is growing. Constitutionalist agents on the border assert this is a fact. The arrival of a train from San Luis Potosi at Mexico City without Mr. Silliman has reawakened fears in Washington about the consul's fate. * * * Villa's main army engaged 5,000 of the Federal garrison outside Saltillo May 19. The Federals were repulsed with heavy losses. The rebels took 800 prisoners and captured 600,000 rounds of ammunition. * * * At Paredon a desperate battle was fought May 19. At Ramos Arispe there had been desperate fighting for two days. Throughout the country lying between and in the district near Saltillo skirmishes, which are in reality battles of lesses magnitude, are being waged constantly. Details of the Saltillo campaign indicate that Saltillo may be in practically every respect a second Torreon. The Federals are not surrendering an inch of ground without a battle. Every move toward Saltillo made by the rebels is met with determined resistance by the Federals.

Eggs were 50 cents each, meat $3.50 a kilo, hay $15 a bale, and other prices are in proportion in Guaymas, Mexico, according to advices received May 15. The people of the west coast port are literally starving. Only the rich can afford to buy the few food articles purchasable, and the poorer people are dying by scores daily of starvation. Because of the siege of the city the people fear to attempt to get away. Even fish are prohibitive in price, all of the fishermen having either been impressed into the Federal army or having joined the rebels.

NEW YORK STATE NEWS.

MADISON COUNTY FARMERS.—At a meeting of farmers of Madison County recently a coöperative organization was formed under the new State laws, and the following were elected officers for the ensuing year: Levi Timmerman, president; J. H. Wilson, first vice-president; E. O. Messenger, second vice-president; K. M. Harsh, secretary; A. H. Root, treasurer. The meeting was held at Grange Hall in Canastota, and representatives of the State Agricultural Department were present. Those interested in agriculture and in truck crops especially, fully realized the importance of coöperation and the plans presented by the representatives of the department appealed to them with great force.

RECORDS BROKEN.—Four world's records are said to have been broken last week at the Holstein-Friesian sale at the Liverpool pavilion near Syracuse. At private sale $25,000 was paid for a half interest in King Segis Pontiac Alcartra. An unnamed son of the same bull brought $11,300 at auction, the highest price, it is said, ever paid for a bull calf. It went to Fred J. Karlin of Illinois. Another record went down when Mr. John Arfman of Middletown, paid $3,000 for the cow, Lyndon Alcartra Polkadot. She is a 32.67 pound animal. The world's record price for a three-year-old was paid by the Lawson company in giving $1,050 for the cow Finderne Pontiac Twisk, with a record of 30.60 pounds. Briar Daisy, a 31-pound cow, was sold by F. W. Scott of Granville for $1,400, and her yearling daughter went at the price of $535. The average price paid at this sale of Holsteins on more than 100 head, was $1,400.

CREAMERY BURNED.—The Thousand Island Creamery, located near Alexandria Bay, was burned to the ground on May 18, loss $10,000. The building carried an insurance of $3,000, and the machinery contained therein was valued at over $4,000. It was not insured but was rendered useless; also 1,500 pounds of butter and 10,000 pounds of milk were destroyed. About 300 pounds of cheese were carried out and saved.

LEGISLATURE ADJOURNS.—The special session of the State Legislature adjourned on Wednesday afternoon, May 20. The appropriation bills commanded the attention of the legislative leaders and committees, and several conferences were held to see if an agreement could be reached on several items before the bill was again submitted to the two houses. When the members gathered for the final session it was found that the appropriation bills totaled over $35,000,000. The revenues of the State from indirect resources amount to about $42,000,000. Special appropriations amounted to about $6,000,000, and it is intended to keep about $2,000,000 in the treasury. The Governor was asked if he would sign a bill levying a direct tax of one-tenth of a mill to make up the deficiency. He would not. And he told the conferees if they didn't cut out or cut down some items he would. They then reduced the amount called for to $34,445,000. The reduction cut out $200,000 for the elimination of railroad crossings; $10,000 for the School of Forestry; $10,000 for improvements at Cornell; $30,000 for a new building at Alfred University; $10,000 for heating State fair buildings; $10,000 for Geneva Experiment Station; $35,000 for printing the session laws, beside several others. The date of holding the primary election was changed so as to accommodate Jewish voters, Atonement Day falling on the date first set for the primaries. J. W. D.

NEW ENGLAND MILK SITUATION.

Much milk legislation has been agitated the past few months by interested parties, among this several bills recommended by former Mayor Fitzgerald to define pure milk, or what would be recognized as such by health boards and under the law. These last were all turned down by the Legislature, while some others have not been reported from committees yet. The one most noticeable and most heard of is the former so-called Ell bill, now recommended under a new name, and also changed somewhat from its former shape; yet the general features and objects of this bill remain the same. It does not look at present as if any legislation of any importance would be passed at this session for reason of a contemplated change in the State Board of Health, which now consists of several members, all having about equal authority, to do away with these altogether, and have all authority vested in one head, known as Health Commissioner. The present idea is to appoint one for five or six years and have an advisory board of perhaps six members to assist him, all these to be physicians of good standing.

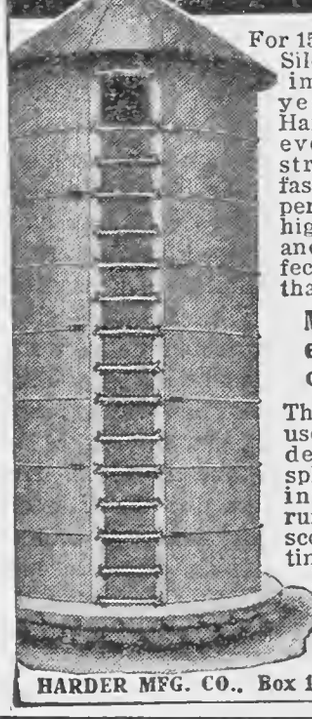
Governor Walsh is a strong believer in the plan, and is working to bring the change about. As it would be bad policy to pass a bill on milk requirements, etc., that would conflict in any way with the above changes at this time, a general understanding exists to rest easy and let present laws and regulations suffice until we know just what we are at. So many mistakes have been made in the past on these matters that "be sure you are right before you go ahead" is the best and safest policy, and this will be followed at this time.

Two interesting notes show some light as to the matter of profit made by milk contractors. In this case it is the H. P. Hood Co. which is reported to be paying producers in a certain section in Massachusetts the following price for milk: For April, 2.98 cents per quart; May, 2.05; June, 2.07; July, August and September, three cents, an average for the Summer months of less than 2¾ cents per quart. These are net prices at the farm. The same company has just been awarded a contract to supply the Boston City Hospital 1,200 quarts daily at 6⅝ cents per quart. I should like to see this company figure this difference in price to make good their claims in the past of only a fraction of a cent per quart staying with them as profit. I know they employ experts to do their figuring. Here is a chance to keep them employed to make the right showing on paper. Can they do it? It does not seem possible that present low prices paid for Boston wholesale milk could long continue, as we are advised that some dealers are not getting enough for their wants (at present time, which is the flush time of all the year) but are looking for new dairies to add to the present supply. I also know of many producing dairies in the surrounding towns which have sold a large part of their cows this Spring, and some of these will sell the rest as soon as buyers can be found. These facts and other causes which will be heard of in the next few months must bring a better price; all signs point that way. Also the Massachusetts Railroad Commissioners reports show a falling off of 726,184 quarts in March of 1914 from March of 1913.

The only way to make up the shortage is to ship in more long-distance milk, which must be treated to be safe for use, and yet in the face of these facts the Meaney bill to label this milk as to source of production was turned down last year. Does it mean people do not care where their milk supply comes from, or how old or how much or what treatment it may have received? Do not the consumers want nearby fresh Massachusetts milk? It certainly looks as if they were not particular about it. All these things should be looked at and studied by the new Commissioner when that change is made, and any new laws passed should consider these points, and the blame should be put where deserved for letting this state of affairs get where it is.

Around four cents per quart, wholesale, seems to be about the average price paid for Summer milk in different cities in New England. I know of a very few cases where producers are receiving five cents per quart. I wish there were more of these at a profit, for anything less is out of the question under our conditions, and yet too many producers are willing to sell for less. In some cases their circumstances are such they can't turn to anything else, and must sell at practically what is offered; but some who sell at these prices are not obliged to, but they do it. Another case for education; let the good work go on, and keep it moving. A. E. P.

Harder Silos



For 15 years the One Best Silo. Big, sensational improvements this year, making the Harder Silo better than ever. Of massive strength, anchored fast, solid as an oak, perfect fitting doors, highest grade material and construction—perfect in every detail—that's the Harder Silo.

More durable, less expensive, than concrete and tile.

The kind "Uncle Sam" uses. Big free catalog describes the new spline-dowel, the new intermediate ladder rung, the anchor, and scores of other distinctive features. It tells why *you* need a Harder Silo. Write today.

Elbert Hubbard
(Fra Elbertus)

Recently took "time off" long enough to write a message to farmers on the subject

"The Silo and Which is Best"

The article, which is sort of a history of silos generally, is penned in Elbert Hubbard's unique and interesting style, with all the quirks and quirls and homely philosophy that have made the Sage of East Aurora famous.

Through an arrangement between Mr. Hubbard and The Canton Culvert Company, makers of the famous

"ZYRO" Galvanized
ANTI-CORROSIVE
No-Co-Ro METAL SILO

The article has been published in booklet form. A free copy is yours for the asking.

The Canton Culvert Co., Box 440, Canton, O.

UNADILLA Was Chosen

New York authorities demanded durability, preservability and economy, found all three qualities in the Unadilla Silo and erected 15 on State Industrial farms. Same reasons led the Borden Milk Co. to equip their model farms with Unadillas. Send for catalogue and conclusive proof of superior construction and new features. Liberal discount for early orders. Agents wanted. Address

THE RURAL NEW-YORKER,
333 WEST 30th ST., NEW YORK.

PUBLISHER'S DESK

I note your article relative to Frederick O. Groesbeck of Hartford, Conn. I write this to say that on February 28, 1908, said Groesbeck ordered from me 2,000 cinnamon vines, amounting to $24. These I shipped him at once. I have not been able to get anything at all from him in payment. A. T. C.
New York.

We demanded payment on this account, and get the reply that he owes this correspondent nothing . At the recent suit for libel, three bills from three different publishers for advertising were presented against Groesbeck, and he denied owing any of them. Two protested notes were presented, and he denied owing anything on them. Two unsatisfied judgments were presented, one of them for wages of an employee, and he repudiated them. He admitted himself that he put the title of his poultry farm in his mother's name, made a bill of sale of his store to his father, and a bill of sale of chickens to another man at the time these creditors were pressing for payment. Hartford lawyers, it was testified, reported him execution proof, and Groesbeck testified that the sheriff on one occasion "got in bad" by making a levy on chickens which he had covered with a bill of sale. Under the circumstances we advise A. T. C. to charge his $24 to profit and loss.

I am very glad of the strict supervision of the advertisements of THE RURAL NEW-YORKER, and assure you that if anything can be done to make the other farm papers come up to the same high standard I will do what I can for the cause. I enclose a letter advertisement, which must be quite largely distributed among a varied class of people, as it is a multigraph letter. It looks to me as though the main thing in the blank is the three dollars to be remitted. I have had such letters from varied sources, and have always gone on the supposition that if I could write anything worth publishing I could find a place for it without contracting and paying in advance for its distribution. The general style, however, is such that many imaginative young people might be misled into thinking that the remittance of the three dollars would make them finished writers with good incomes. Your paper has improved greatly in the past few years. C. S. G.
Pennsylvania.

The advertisement enclosed is from Franklin Davies, literary agent, 500 Fifth Avenue, New York. The $3 fee is requested to show sincerity and in return you will receive an outline for a marketable story, with suggestions for style, length, etc., and the story when returned to him will be sold for from $15 to $75 less 20% commission. If the story you submit is not marketable it will be returned for correction. We rather assume the majority of the manuscripts would be returned. Our subscriber is right. If you write anything of merit you will find a place for it without paying some one for the privilege of outlining your plot.

Herbert Myrick, the self-styled editor and president of Springfield, Mass., does not like the Land Bank of the State of New York. He says it is a failure, but he has not learned enough about it to know that it has not been yet organized. The only place that a bank which does not exist can be a failure is in the mind of a prejudiced critic. What Mr. Myrick doesn't know about the Land Bank is apparent in the jumble of things he says about it which are not true. But no one expected this bank to please Myrick. How could any bank without the Myrick brand please Myrick? When he built the much lauded concrete building, some years ago, Mr. Myrick introduced a financial scheme that he might approve for New York State farmers. He controlled several incorporated stock companies which never owned a brick or a foot of ground, and issued from them building certificates giving the impression that they had the Myrick building behind them as security. In fact the purchasers of the certificates were, in some instances at least, told flatly that the certificates made them part owners of the building. They of course did nothing of the kind. The certificate shorn, of much confusing verbiage, was simply an acknowledgement that the holder of it had deposited fifteen dollars with Mr. Myrick. It afterwards turned out that the depositor had to die to gain some of the promised rewards for the use of the deposited money. It bore about the same relation to the Myrick building that a farmer's unpaid grocery bill bears to his neighbor's barn. Farmers have had trouble in getting the money sent for these certificates returned, and several of them have appealed to us for help. We collected the money on one of them from Mr. Myrick some days ago. Such is one of the Myrick schemes of finance. New York State farmers do not want any of that style of finance in their system of farm credits. There is none of it in the Land Bank and the omission probably accounts for Mr. Myrick's sneers.

The New York State League of Savings and Loan Associations will hold its annual meeting in the convention hall of Hotel Statler in the city of Buffalo, on June 11 and 12. Mr. Edwin F. Howell, chairman of the legislative committee, will give an exhaustive analysis of the provisions of the new Land Bank soon to be organized. Many other important subjects are to be discussed by men of State-wide influence and fame. A symposium on "organization of new associations and gaining the confidence of the community" will be a feature of the meeting. This will interest farmers, as many of them will become members of the new association in order to benefit by the provisions of the Land Bank.

"An ounce of preventive is worth a pound of cure." I am urged to invest in three dozen washers for $19.80 plus freight, and to sell them at $54, making a profit on same of $34.20 or nearly 173%. It seems too good to be true. Can you express an opinion on the subject? I omit the name of the company intentionally. If honest they should pay for their advertisement. If not reliable I will expose them gladly. INQUIRER.
New Hampshire.

This class of advertisers appeal to the cupidity of local agents. They offer you big profits to get your remittance; but the profits must come, not from them, but out of your neighbors. They do not care whether you get the $54 or not, so long as they get the $19.80. At best they offer you the privilege of faking your neighbors. In this particular instance, at least, we think they have picked the wrong man.

I have two shares of preferred stock of the Monaton Realty Investing Corporation, par value $100 each. What chance is there of getting anything on them? I had a letter from a party in Connecticut who proposes to issue participation certificates to be secured to the same extent as second mortgagees holding mortgages against the property. I wrote the corporation and never got a favorable reply. R. R. S.
Vermont.

Our latest advice is that the receiver of the Monaton Realty Investing Corporation, Maximilian Morgenthau, filed a report in the Supreme Court that he had been unable to find any cash of the corporation, that it had no active bank account, and there were no funds in his possession with which to defray the cost of an examination of its affairs. The company's books are in the possession of the United States Attorney. Proceedings are under way to forfeit the charter of the company. It is doubtful if the shares have any value whatever; and it is not advisable to put up any new money on any pretext.

I don't need your paper any more than "a cat needs two tails." However, I am anxious to show my appreciation to any publication that has the nerve to show up the fakes and frauds the way you have. It must mean a good deal to turn down the advertising you do. You are doing a great thing for the farmers. I don't see how a farmer dare be without THE R. N.-Y. I hope to be able and eligible to do some advertising in your paper in the near future. F. W. T.
New York.

The thought of this letter comes to us in many different forms of expression. In them all the wonder is expressed that THE R. N.-Y. does not have more subscribers than it has, though the list is constantly growing. Business men understand the meaning of loss of revenue from discarded advertising, but few understand the expense of getting information that justifies the criticism of respectable crooks. Even then the rogues sometimes think they can hoodwink the public by filing a libel suit. Whether they are ever tried or not and as a rule they are not, there is heavy expense in preparing for them. If tried, a single sympathizer with crooks on the jury can prevent a clean-cut rebuke to the schemer by insisting on a disagreement. No paper could face such conditions without the full sympathy and coöperation of a large list of subscribers. The larger the list the easier the work. It is the only opportunity that farmers have ever had to express themselves in this kind of protection. It will continue as long as they approve of it and want it. It could not continue, if they became indifferent to it.
J. J. D.

Wet or Dry Mash.

Have there been any comparative experiments between the moist and dry mash in feeding poultry carried out systematically by an experiment station? If so which method gave the better results?
Maine. F. C. C.

I am informed that the Experiment Station at Cornell University has conducted some extensive experiments with the different methods of feeding, but that the bulletin giving the results of their experiments is now out of print. In one they fed four pens of 40 birds each; pen 1 was hopper fed upon grain only and gave a net profit of $15.35; pen 2 was fed three times daily upon grain only and made a net profit of $19.96; pen 3 was fed grain morning and night and a wet mash at noon, and the net profit was $21.25; pen 4 was fed grain morning and night and a dry mash of the same feeds as were given wet to pen 3 was kept before them; the profit was $28.67. I presume that other stations have carried out similar experiments, though I do not know of them. So far as my observation has gone, the feeding of dry mash has become well nigh universal with poultrymen keeping fowls upon a large scale, and while the above ratio of profits would undoubtedly not always obtain, there is little doubt that it is the most profitable method. M. B. D.

Eradicating Hen Lice.

My old fowls are quite badly affected with the large gray hen lice. Will you give me a certain method to get rid of these vermin? C. G. G.
New Jersey.

The only certain method of permanently freeing fowls of body lice that I know of it to dust them at frequent intervals with a good lice powder, but few will take the pains to do this sufficiently often and well entirely to rid the fowls of their parasites, and fortunately it is not necessary that this should be done. If given access to a good dust bath and kept free from the red mites by painting the perches, nests boxes, etc., with some good insecticide like kerosene and carbolic acid, the less important large body lice will do little or no harm in any numbers in which they are likely to survive.
M. B. D.

Charcoal for Poultry.

Is the practice of feeding charcoal to poultry based on scientific or practical principles? Does it have any chemical effect upon the hen, or is its value largely mechanical?

In regard to charcoal, theoretically it is valuable in poultry rations as a purifier or absorber of impurities, but personally I have never had a great deal of faith in its actual practical value. In fact, we feed practically none of it in our rations here, nor do we recommend the feeding of it. Chemically, or from a true nutritive standpoint, I do not believe that it has any value. It may have a little, as I mentioned, as an internal disinfectant or absorber of impurities.
New Jersey Station. H. R. LEWIS.

It is my personal opinion that charcoal is of no particular value if the chicks are in health, and I am not sure that it is of any particular value if they are out of health, although it has sort of been assumed that chicks with digestive disorders, especially where there was any tendeney for the formation of gas, should receive charcoal which would tend to absorb these gases and perhaps be of some service. I feel that no special physiological effect is to be expected from the use of charcoal, nor has it any chemical properties that make it particularly desirable. I think the prevalent idea in using it is that it may be a sort of chemical absorber. I am afraid, however, that after all we cannot cite you any experimental evidence bearing on this point.
Storrs, Conn. W. F. KIRKPATRICK.

I fed charcoal for years, both in mash feeds, pulverized and with cracked grains and in hoppers, granulated. I considered it a conditioner, crop sweetener and a sort of cure-all. Sometimes when the chicks were not eating as well as usual or droppings were off color I would put in a double dose in their dough, and I was satisfied that it was a good "cure-all.". I am not ready to say that it is of no value. We are using a very little, if any, at this time. I would rather suggest that it be placed in the hoppers where poultry of all ages can get some if they wish to do so. D. J. LAMBERT.
Rhode Island.

May Rilma Beats All Records

Products, Prices and Trade.

Wholesale Prices at New York.

Week Ending May 22, 1914.

MILK.

The Borden milk schedule to producers for the six months beginning with April is as follows, compared with last year. This is per 100 pounds in the 26-cent zone. For the 29 and 32-cent zones the schedule is 10 cents less for all months:

	1914	1913
April	$1.40	$1.50
May	1.15	1.25
June	1.10	1.10
July	1.25	1.35
August	1.40	1.45
September	1.50	1.55

Figuring 86 pounds to the 40-quart can the per quart price is as follows: April, 3.01 cents; May, 2.47; June, 2.36; July, 2.68; August, 3.01; September, 3.22.

Wholesale prices paid by New York dealers are running $1.51 and $1.41 for B and C. Hotels and restaurants using two to three cans per day are paying 4¾ to five cents per quart.

BUTTER.

The early part of the week was decidedly a buyers' market, but later, receipts were higher and the accumulation was cleared up in better shape, prices running one-half to one cent below the previous week. There is some improvement in quality, but none of the new make is suitable to hold.

Creamery, extra, lb	25	@	26
Good to Choice	22	@	24
Lower Grades	19	@	21
Storage	17	@	22
State Dairy, best	24	@	25

VEGETABLES.

The close of the old potato season finds an exceedingly weak market and heavy losses by some late holders. Receipts have continued large with a considerable quantity from Europe. Part of the time new potatoes from Bermuda and the South have sold at prices that attracted buyers who ordinarily stick to old potatoes. The onion market is very firm and prices unusually high. Cabbage in heavy excess and low. Asparagus in large supply both from the South and nearby.

Potatoes—Maine, 180 lbs.	2 50	@	2 75

HAY AND STRAW.

Receipts are only moderate and prices on the same level as last week. The last Government report gave the amount of all hay on farms as 7,830,000 tons. This is 1,998,000 less than in 1913 and 3,086,000 more than in 1912. Private advices from Northern and Central Ohio are that about 10 per cent. of the old crop is in farmers' hands, and that the outlook is favorable for a large new yield. In Western New York farmers still have large quantities of old hay on hand, which will be marketed as soon as the Spring planting is over.

*

During the first three months of this year, 1,860,000 dozen eggs were shipped from China to the United States. These cost from 12 to 15 cents per dozen delivered at shipping point. The freight cost to Seattle is about $2.10 per case of 30 dozen, but this does not include cold storage and would be the cold weather price by the Northern route. Refrigeration would double the cost. In future all cases of eggs from China must be branded "Product of China." Many of them have previously been labelled "Fresh Pullets," as they often run small.

*

Is there a steady demand in New York city or nearby markets for white shell Indian Runner duck eggs (best grade) every month in the year? Can you quote me about what would be the average market price? W. S. B.

These white duck eggs sell well in New York at times, but the market is irregular. Two months ago some of them brought 40 to 45 cents wholesale; now it is hard to sell them, a good many going as low as 18 to 20 cents. The very finest were recently seen retailing at 25 cents per dozen. It will be well to go slowly about starting a large white duck egg plant if New York market must be depended on to handle them. W. W. H.

May 12.—Wheat 80; oats 45; corn 80; hay $15 per ton. Butter 20; cream 23; eggs 15. Hogs $1.75 per 100 pounds; milch cows $50 to $80; yearling steers and two-year-olds are selling at 7 cents per pound. Potatoes $1.20, shipped in. No demand for garden truck in a small town. J. H.

Gira d, Kan.

This is mainly a mixed farming country with corn, oats and wheat as the main crops, and dairying as a side line. Corn 57; oats 32; wheat 70; cream 21½ cents. No milk sold as every farmer has a lot of pigs. Good milch cows $90. All stock cattle sell about the same as at Omaha. Eggs 15 cents; chickens 11 cents. P. H.

Leigh, Neb.

May 14.—This section has extra good prospects for wheat, oats fair, corn planting about done, being a little later than usual. Apples and peaches look well, cherries fair; very few strawberries and pears. We have had rather a cool Spring. Prices of live stock follow closely the Kansas City markets. Not much dairying done here. Country butter 17; eggs 16; hens 13. J. R. M.

Butler, Mo.

May 5.—Cattle are held at high prices, the large herds at about $8 to $8.50 per cwt., either a little more or less, according to condition. Dairy cows have sold at auction sales for about $80; some animals I saw sold for $86, and one cow for $92. Heifers were sold at public sale February 17 at $38 to $42. Pork at the market, now $9 per cwt. Potatoes sold in car lots in the Fall at 90 cents per cwt.; lately at 60 cents per cwt. Apples sold last season, mixed lots, at $1 to $1.14; cherries sweet at five to seven cents; sour, three cents a pound; apricots five cents a pound. Butter 20; eggs 15. In the Winter butter was 25 to 30; eggs 35. One of our local cattlemen told me a few days ago of a prospective deal of $50,000, he to take a half interest: in that case the cattle to be lumped at so much a head. During the Summer the cattle are pastured on government land on the hills; in Winter the feed is Alfalfa hay. C. L. G.

Cedar Edge, Colo.

Rheumatism.

I have a fine cow dog (Great Dane) about two years old. About three months ago we noticed he acted as though he was sore in his loins. He used to jump and put his front paws on my shoulders, but now he cannot raise himself a foot from the ground. If he runs fast he yelps with pain. Has had worms. His appetite is good, but is not anxious to work. What is the trouble? P. H. E.

While it is possible that the dog has a chronic disease of the kidneys the disease may prove to be lumbar rheumatism and that would offer more promise of recovery. It would be best, if possible, to have the dog examined and prescribed for by a graduate veterinarian. He should also examine the urine. If you cannot have this done give the dog a five grain capsule of salol night and morning and if found necessary give a similar dose every four hours when the dog is suffering acutely. Keep him in a warm, dry place. A. S. A.

Subscribers' Exchange

Complying with several suggestions received recently, we open a department here to enable RURAL NEW-YORKER readers to supply each other's wants. If you want to buy or sell or exchange, make it known here. This Rate will be 5 Cents a word, payable in advance. The name and address must be counted as part of the advertisement. Copy must reach us not later than Friday to appear in the following week. No display type used, and only Farm Products, Help and Positions Wanted admitted. For subscribers only. Dealers, jobbers and general manufacturers' announcements not admitted here. Poultry, Eggs and other live stock advertisements will go under proper headings on other pages. Seed and Nursery advertisements will not be accepted for this column.

COLLEGE STUDENT wants work on good general farm for 12 weeks during Summer. Address M. G. M., 517 W. Fourth St., Elmira, N. Y.

POSITION WANTED AS WORKING FOREMAN by married man, 35 years old; five children; 20 years' experience. B. J., care R. N.-Y., 333 West 30th St., New York.

MAN WITH BIG EXPERIENCE HANDLING men on public works wants position on farm or estate; practical farm and poultry experience; expert on grading and dynamite work. K. O., care R. N.-Y., 333 West 30th St., New York.

WANTED, A PRACTICAL FARMER, to take charge of a 34-acre farm near Greenwich, Conn. As a special inducement to good, reliable man, owner will make no charge for first year's rent. Apply MADAME EUGENIE, 634 Fifth Ave., New York.

ALFALFA HAY. F. P. ERKENBECK, Fayetteville, N. Y.

WANTED—Family cow, goose eggs, goslings, for cash and light horse. MUELLER, R. F. D. 2, Westwood, N. J., care HAUETER.

VERMONT MAPLE SYRUP @ $1.00 PER GAL.; maple sugar, 5 and 10-pound pails, 15 cents per pound; fancy caked sugar, 18 cents. Choice fresh eggs in any quantity. JAY T. SMITH, Rupert, Vt.

HUMOROUS

QUIDNUNC: "What makes your hair so much grayer than your whiskers?" Bulfinch: "Why, my hair is a great deal older than my whiskers."—Woman's Journal.

"EVERY time I see grandfather's sword I want to go to war." "Well?" "But every time I notice grandfather's wooden leg I cool down."—Louisville Courier-Journal.

A BACKWOODSMAN who had been elected to the Legislature went to the city postoffiee to get some stamps. "What denomination?" inquired the clerk. "Lutheran," said the member, modestly. —Woman's Journal.

LITTLE Rollo had been reproved for his table manners by papa and mamma. He trained his baby stare on mamma to ask: "When you was a little girl didnt y'ever dip your jelly roll in coffee?" "No, my dear," with a tinge of acerbity. "Y'ot to try it. Gee, it's great!"—Buffalo Express.

"Now, Thomas," said the teacher severely, "how many times must I tell you not to snap your fingers? Put your hand down and presently I'll hear from you." Five minutes later she said: "Now, then Thomas, what was it you wanted to say?" "There was a man in the entry a while ago," said Thomas serenely, "and he went out with your new silk umbrella.'—Toronto Sun.

AN Ohio man tells of a farmer in that State who, even in the hour of adversity, could think of others. An unseasonable frost had completed the damage done by the insects to his potatoes. The tops of the plants, which had served as pasturage for the pests, were wholly destroyed. Meeting him at the post office one day a friend asked: "How are you, Tom? Things goin' well?" "Goin' well!" exclaimed the old man, "I should say not! There's trouble and plenty of it! Why, up at my place there's nine million potato-bugs, an' nothin' for them to eat."—Credit Lost.

A NORTHERN school teacher was spending her vacation down South, and, as she was passing a tumble-down shanty, she heard an old negress call to a child: "Come heah, yo' Exy! Exy!" "That seems like a very peculiar name for a child, Auntie," said the teacher. "Dat ain't her full name," answered the mother with pride; "da't jest de pet name I calls her fer short. It's a mighty grand name wot dat chile has got. I picked it out'n a medicine book. Dat chile's full name am 'Eczema.'"—New Orleans Picayune.

A MERCHANT'S carnival was being held in a country village and little girls represented the various shops. One, dressed in a white muslin frock, gayly strung with garlands of bon-bons, advertised the local candy store. When the festival began she fairly glistened with attractive confectionery, but as time wore on her decorations grew less. Finally, at the end of the last act, not a bon-bon was to be seen. "Why, Dora!" cried the stage manager, "where in the world are all your decorations? Have you lost them?" "Oh, no," replied Dora: "They're perfectly safe. I'm wearing them on the inside."—Toronto Sun.

Flying Dutchman Hay Loader

No Ropes
No Chains
No Cogs
No Gears
No Delays

The One-Man Loader

With this Loader, one man can put on a good, even load of hay, in practically the same time that it would take two men with other loaders.

The Flying Dutchman loads hay, clover or alfalfa without "chewing it up" or threshing out the seed.

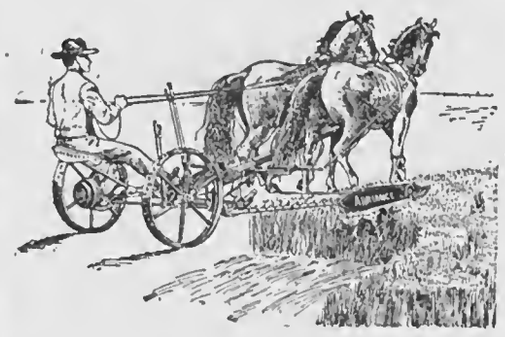
It operates with the long, easy, natural stroke of the hand rake, elevates carefully and loads it on the wagon in excellent condition.

Works on an entirely new principle that does away with all cams, drums, chains, sprockets, rope webs, gears and trouble.

Light Draft and Long Life—There's nothing to wear out or get out of order, and the extra long stroke does not pound the machine to pieces.

No Clogging—The yielding deck effectually prevents clogging. Heavy or light hay, swath or windrow can be handled without any adjustment.

All-Steel Frame—It cannot warp, sag, rot, nor get out of shape.



Many ADRIANCE Mowers In Use 40 Years

Are giving excellent service today. No other Mower has such a record because none is so well built.

Adriance Mowers have nearly 60 years of the hardest kind of service back of them.

They are the best made—simplest in construction—lightest draft—most powerful—need fewest repairs, thousands of users will testify.

Adjustable carrying springs take weight from center bar and put it on the wheels, greatly reducing draft and increasing traction.

Cutter Bar follows the ground no matter how uneven it may be.

Automatic spring draft prevents damage to machine, driver or team in case obstruction is struck.

Forward acting, natural position foot lever makes ideal foot brace in controlling fractious team.

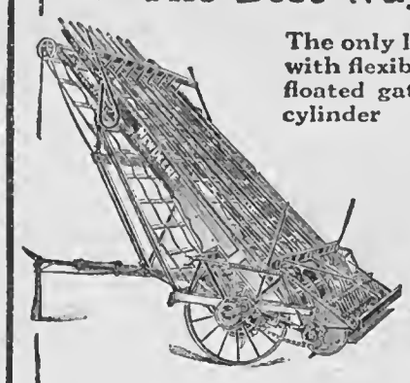
Many other strong Adriance features explained in our FREE BOOKLET. Write for it today.

Your Flying Dutchman Dealer sells Adriance Mowers, Flying Dutchman Hay Loaders and complete line of Flying Dutchman Farming Implements. See him.

Moline Plow Co.

Dept. 119 MOLINE, ILL.

Make Your Hay The Best Way



The only loader with flexible floated gathering cylinder

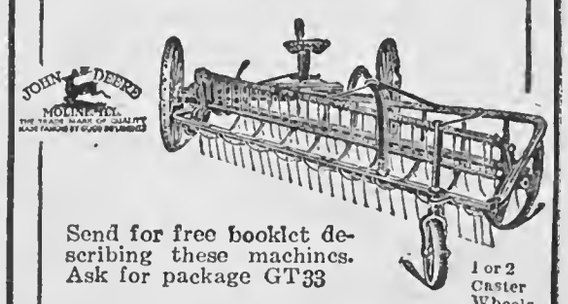
New Deere Hay Loader

The loader with the floated gathering cylinder with its numerous flexible fingers which successfully handles anything from the lightest swath to the heaviest windrow without adjustment. It picks up all the clean hay but leaves the trash. Puts hay on the center of the wagon so that none falls off. An easy running loader noted for its gentle handling of the hay. None of the foliage, the most nutritious part of the hay, is damaged. Use a New Deere Loader. It not only does the work well at first, but does it for many years.

Dain Side Delivery Rake

Gently gathers up all the hay without damage and leaves it in fluffy windrows through which the air can readily pass so that it is cured without sun scorching. It makes best quality hay.

The rake with the steel arch and a reel with three sets of closely succeeding flexible teeth. A construction which means not only durability of machine but gentle handling of hay—a John Deere implement.



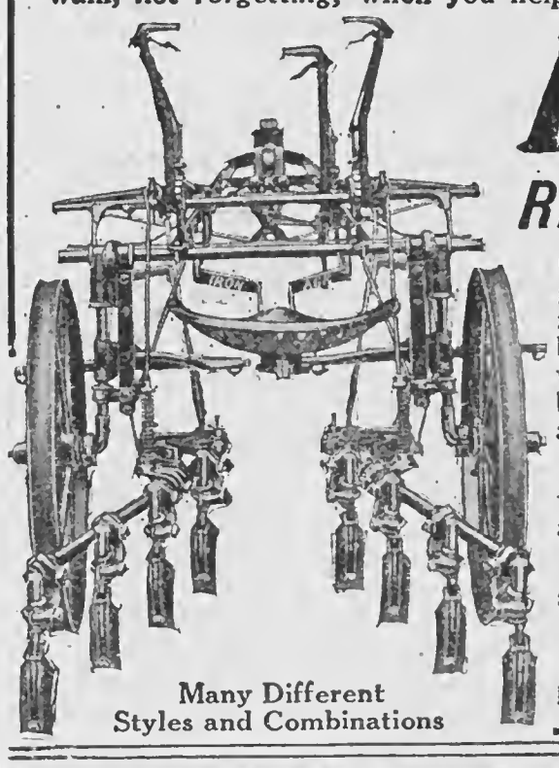
1 or 2 Caster Wheels

Send for free booklet describing these machines. Ask for package GT33

JOHN DEERE
Moline, Illinois

HELP YOUR HELP

By furnishing them "fool proof" implements which do the best quality of work with the least effort, permitting them, where possible, to ride instead of walk, *not forgetting*, when you help your help you help yourself.



Many Different Styles and Combinations

IRON AGE
RIDING CULTIVATORS

Carry every possible adjustment of teeth, gangs, wheels, frame, etc., to care for all row crops in any kind of soil. They are built with high or low, pivot or fixed wheels, grooved, flat or zig-zag gang bars, for one or two rows and with many attachments for special work.

Ask your dealer to show them and write for booklet, "Two-Horse Riding and Walking Cultivators."

Also full lines of potato machinery, sprayers, and garden tools.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. LXXIII, No. 4258. NEW YORK, JUNE 6, 1914. WEEKLY $1.00 PER YEAR.

A TREATMENT FOR WHITE DIARRHŒA.

"Commercial Starter" for First Feeding.

IN February, 1913, I took charge of the poultry department of Broad Brook Farm, and for the first three months was accustoming myself to the work of a new position. There were about 2,000 pullets for egg production only; and 500 yearlings, the pick from the previous year's 2,000 birds, used as breeders. About May 1st I took personal charge of the young chicks and incubators and found them badly infected with bacillary white diarrhœa. The mortality previously had been very high, which I supposed was largely due to this trouble. The chicks were dying in such large numbers, it was questionable whether we would be able to fill our laying houses in the Fall. I was informed there had been white diarrhœa in the plant the year before. After a talk with the superintendent, he wrote to three of the leading experiment stations on poultry. They advised having a State expert on white diarrhœa come down and go over the plant. We requested him to come down and advise us what it were best to do.

EXPERT ADVICE.—He arrived about May 6th, and after looking over the baby chicks, and making a bacteriological examination of them and some hens, said the plant was badly infected with bacillary white diarrhœa (Bacillus pullorum), and that there was no cure. The State Expert advised us that the only way to get the plant free from white diarrhœa was to have a blood agglutination test of all breeding stock, use eggs for breeding that were from hens that proved free of the disease, or sell all the stock and make a new start next season with eggs from a plant known to be free from the trouble. While he said there was no cure, he advised us to use sulphocarbolate compound with mercury, sulphocarbolate 30 grains, mercuric one grain, and so try to reduce the high mortality and enable us to raise the 2,000 pullets. I state this to emphasize the seriousness of the trouble.

THE BABY CHICK AND THE BABY CHICKENER. FIG. 317.

METHOD OF TREATMENT.—The method used was to make a stock solution, use it in the drinking water and in the wet mash, and squirt a pen dropper full down each chick's throat as it was taken from the incubator. We tried this medicine on a number of hatches, and found very little benefit from its use. Here, and where I had charge of poultry before, I always gave the baby chicks all the sour skimmed milk they would drink, keeping it always before them in open pans, also fresh water with permanganate of potassium in it, in fountains. As sour skimmed milk has always been a great help in raising baby chicks, on account of its anti-putrefactive action in the intestines, I decided to use sour skimmed milk, or still better, commercial starter (6% to 7% lactic acid), on account of its higher percentage of lactic acid, in comparison with the medicine.

PREPARING SOUR MILK.—Commercial starter is made by adding a good lactic ferment (which can be obtained from any dairy supply house) to a small quantity of sterilized skimmed or whole milk that has been cooled to a temperature of 85° F. after sterilizing, and let stand in a warm room (70° F.) until it has curdled; this takes from 20 to 40 hours. As soon as it curdled it should be cooled down to 50° F. or lower; this prevents any further growth of

germs. The commercial starter should not be allowed to get over-ripe, as the germs are most numerous and most active in the starter about the time it curdles. Everything that comes in contact with it must be sterilized before using. A small package, costing 75 cents, is large enough to inoculate two quarts of sterilized milk. After the first inoculation with lactic ferment, a small quantity of the commercial starter is saved to inoculate the next two quarts or more. If great care and cleanliness is observed it is only necessary to buy lactic ferment for a few inoculations. I have used a good clean buttermilk and sour skim-milk with very near as good results (of course they should not be sterilized, as it would kill the lactic acid bacteria), but prefer commercial starter, as it contains a higher percentage of lactic acid and is a cleaner sour.

USING THE SOUR MILK.—The method I used was as follows: As soon as the baby chicks are dry in the incubator, about 24 hours earlier than I would otherwise move them to the brooder, I take them out and give each chick a pen dropper full of commercial starter down its throat. By taking the chicks out as soon as they are dry, and by keeping the light excluded from the incubator compartment during hatching (I use a dark curtain for this), the chicks have very little chance to eat any droppings or pieces of eggshell, and to a certain extent the spread of the infection is prevented. As soon as I started to use the commercial starter the high mortality stopped, and we were able to raise 60 to 70 per cent of chicks hatched. To give the medicine and commercial starter a fair test I took alternating incubator compartments of chicks, giving to one the medicine, the second, commercial starter, and the third, nothing. In each test the mortality was very high in chicks that were given nothing. In one case 100 per cent, or all, died. The chicks receiving medicine did a very little better than those that were given nothing. Of the chicks given commercial starter, I was able to raise 60 to 70 per cent. In September, 1913, we put 1,650 strong, vigorous pullets in the laying houses and sold over 200.

METHOD OF FEEDING.—A few hours after the baby chicks are in the brooder they are given fresh water with permanganate of potassium in it, and this is always before them. As soon as they learn to drink well, sour skimmed milk is always before them in open pans. This is not given for about two days, as the chicks wallow in it badly and then get chilled. No food is given for 36 hours after they are in the brooder. First two days: Pin-head oatmeal mixed with 15 per cent. fine sifted meat scrap, grit, shell and charcoal, is fed five times a day in low pans, and it is left before the chicks about 10 minutes at each feeding. For the next two days to two weeks fine grains are fed in the litter three times a day, dry mash twice a day in low troughs with screens over them. These are left before chicks 15 minutes in the morning, 30 minutes in the afternoon. Two to four weeks, grain the same as above, dry mash before chicks 30 minutes in the morning and all afternoon. As the commercial starter and sour skim-milk seemed to overcome the disease, we decided to breed our 1914 pullets from our own stock without any blood agglutination test or bringing in new blood. The stock here had been selected for over eight years.

SELECTED STOCK.—This year we have 750 yearling breeders, the pick of last year's laying stock. They will average over four pounds each and are all S. C. White Leghorns. For March their egg production was over 48 per cent; for April 62 per cent; for this month to date it is over 60 per cent. We mated these yearlings with our own cockerels. The cockerels were put with the hens when they were taken off the range in October, 1913. All breeding stock had sour skim-milk to drink once a day for the months of January and February. The milk was given in low pans. This year every chick that is hatched is given a pen dropper full of commercial starter down its throat as soon as it is dry, and has sour skim-milk always before it as soon as it learns to drink without wallowing in it. The feeding, care, etc., are the same as given during 1913.

IMPROVED CONDITIONS.—Our first hatch this year came off February 22. To date, May 6th, we have hatched 4,552 chicks, and the total loss has been 420 chicks, or 9 per cent. There has been no sign of white diarrhœa in any of the chicks that died or are living. All the chicks have grown fast and are strong. Some of the cockerels weighed 1½ pounds at seven weeks, and were crowing. Of course for years sour skim-milk has been fed by many others to baby chicks as soon as they would drink it, but to check or prevent bacillary white diarrhœa I believe it is essential that it be given at the very earliest possible moment after the chicks are hatched. That is as soon as it is safe to remove them from the incubator, so that the lactic acid may prevent or destroy the germs as soon as possible. My method of giving so large a dose and so early in the life of the chick, is to fill as far as possible the intestinal tract with lactic acid. I believe that the one dose given at this time does more good as a preventive and cure than all the sour skimmed milk or other treatment given afterward. I think this is emphasized by the seriousness of the outbreak and high mortality last year before I used this method; and the very low mortality this year and last year after using it.

New York. EDWARD S. PARSONS.

WHAT WOULD YOU DO?

A Chicken Man's Honor.

I SHOULD very much like to have the readers of THE R. N.-Y. express their opinions as to what is the right, just and fair thing to do when one has sent eggs for hatching to an unknown party several hundred miles away, who reports that "none of the eggs hatched: they were all infertile." Suppose that in your own yard eggs from the same pen have tested—after a week's incubation under hens—only two clear eggs out of 43 under the hens, and on the eighteenth day, after taking out the eggs with dead germs, and some eggs had been broken in the nests; there were left 34 eggs with well-developed chicks in, that give every indication of hatching. Such being your experience in your own yard, it becomes very difficult to believe that the dozen sent away were "all infertile." But no matter what you *think*, the question is, what ought you to do? Should you take the buyer's word without question and send him a duplicate of his order without charge, or offer him another lot at half price?

I should like to have a consensus of opinion from both the buyer's and the seller's point of view, as to what really is the honest, just thing to do, and fair to both parties under such circumstances. The seller has used every possible care to have these eggs fertile, has turned them every other day, has packed them so that when received none is cracked or broken, has carefully kept them in a temperature from 50 to 60 degrees, and delivered them in good condition to the express company. Hasn't he done all that his part of the contract calls for? After they have passed out of his control, ought he still to be responsible? Or, is it right that his responsibility should continue until the eggs are actually in the possession of the buyer? Should his responsibility *end* when the eggs reach the buyer? Or must he continue to take all the risks until the chicks are actually hatched out? From the buyer's point of view he has paid out his good money to get, *not eggs* but some chicks; but the getting of chicks may be frustrated in many ways. It is only fair to the seller that his eggs should be tested after a week's incubation and the result at once reported to him; that is, considering his responsibility does not end until after a week's incubation. If no such report is made, and at the end of the hatch he is told that "the eggs did not hatch; all were infertile," is he then in honor bound to replace the eggs without charge? I would like the opinion of R. N.-Y. readers on this question.

GEO. A. COSGROVE.

SHORT COVER CROPPING; GRASS SEEDING

WILL it pay to sow some cover crop in corn at the last cultivation of corn, when same would have to be plowed up as soon as the weather permits after the first of June to get the land ready for oats? The land that I cultivate is comparatively level. On account of handling a fruit crop, it is impossible for me to do any Fall seeding. I am some distance from the railroad and it takes all of my motive power to deliver the apples to the station. I note that you advise against the seeding of grass with oats. I would much prefer to seed the grass in the Fall, but for reasons stated above it is impossible for me to seed grass except in the Spring. I have obtained remarkable results from seeding about 1¼ bushels of oats with one gallon of Timothy and one gallon of clover per acre, using 400 pounds of basic slag per acre. The oats make from 15 to 25 bushels per acre, governed largely by the season. F. D. W.

Virginia.

R. N.-Y.—Yes, we would sow a cover crop even though it had only 60 days to grow. Even in that time rye or turnips or Crimson clover will more than pay for the labor and seed. The cover crop serves a double purpose. It occupies the ground during Fall and Winter, which is the season when most of the valuable nitrates are lost from the soil. We have often told how these nitrates are formed most rapidly during late Summer and early Fall. When the soil is occupied by vigorous young crops most of these valuable nitrates are saved, but when the soil is left bare there is great loss from leaching. Thus the cover crops come in at just the right time to save this loss, for in the South, particularly, there is great loss from the open, unfrozen soil. By all means sow cover crops. THE R. N.-Y. does not lay down any cast-iron rules about farming. With us and under our own conditions Fall seeding to grass gives best results. We can readily see that a combination of other conditions might make seeding with oats more economical. In that case we should certainly follow the plan. It is evidence of good and intelligent farming when men break away, if need be, from standard rules and use their brains to think out the best modification to suit their needs. We have had evidence of this in studying this "Clark method" of seeding to grass. Many farmers found themselves utterly unable to carry out all the details of this system, yet by modifying it somewhat they obtained far better grass than ever before.

RAW PHOSPHATE OR ACID PHOSPHATE.

CONCERNING the discussion in recent issues of THE R. N.-Y., respecting the treatment of manure with gypsum, floats and acid phosphate, permit me to call attention to the experiments at the Ohio Experiment Station, which have now been in progress for 17 years, and the latest summary of which is published in Circular No. 144. Taking the summary for the entire period, as given in Table XIX, it will be seen that the net gain from the use of floats has been so much greater than that from gypsum that *it would have been cheaper to use floats at more than double the price actually paid for it than to use gypsum had it cost nothing.*

As between floats and acid phosphate, the table shows nearly the same relative differences in effect. That is, it would have been cheaper to use acid phosphate at a 50-per cent greater cost than to have used floats as a gift. The only effect that can be certainly ascribed to gypsum is the arrest of ammonia, and acid phosphate is more effective than gypsum in this respect (instead of liberating ammonia, as one of your correspondents states) and it is also the most effective carrier of phosphorus in use as a fertilizer.

But this table does not tell the whole story: Referring to Table XVIII, it will be seen that, whereas all the manures have produced greater increase in yield during the later years of the test than during the first nine years, the manures re-enforced with acid phosphate are the only ones which have caused a greater rate of increase than that produced by the untreated manures. This is exactly contrary to what was expected when the experiment was planned. The floats, or raw phosphate, carries approximately twice as much phosphorus as the acid phosphate, and it was expected that this would gradually become available in the soil and that in consequence the rate of gain from the floats-treated manure would show greater increase than that from the manure treated with acid phosphate.

While the floats has not been as effective a carrier of phosphorus as acid phosphate, there can be no doubt that it is giving up some phosphorus to the crop. In the average, the 320 pounds of floats used in the manure has added $8.36 per acre to the value of the crop, whereas in another experiment in which the same quantity of floats has been used alone in a rotation of corn, oats and clover for nine years, it has produced but $2.60 in value of increase. In considering these results it must be borne in mind that the experiments have been made on a soil hungry for both phosphorus and nitrogen, and this nitrogen is probably one reason for the superior effectiveness of the acid phosphate.

Ohio Exp. Station. CHAS. E. THORNE.

MOST reports tell of a shrinkage in weight of grain in storage. In Utah, a very dry country, wheat gained from two to four per cent. in weight. The grain weighed less at thrashing time than at any other.

THE Egyptian onion crop is only about half that of last year, yet the demand for this shortened product is good and prices are excellent. A large share of this crop is shipped to America through Liverpool, England. Here seems to be a case where one blade of grass brought the farmers more than two blades.

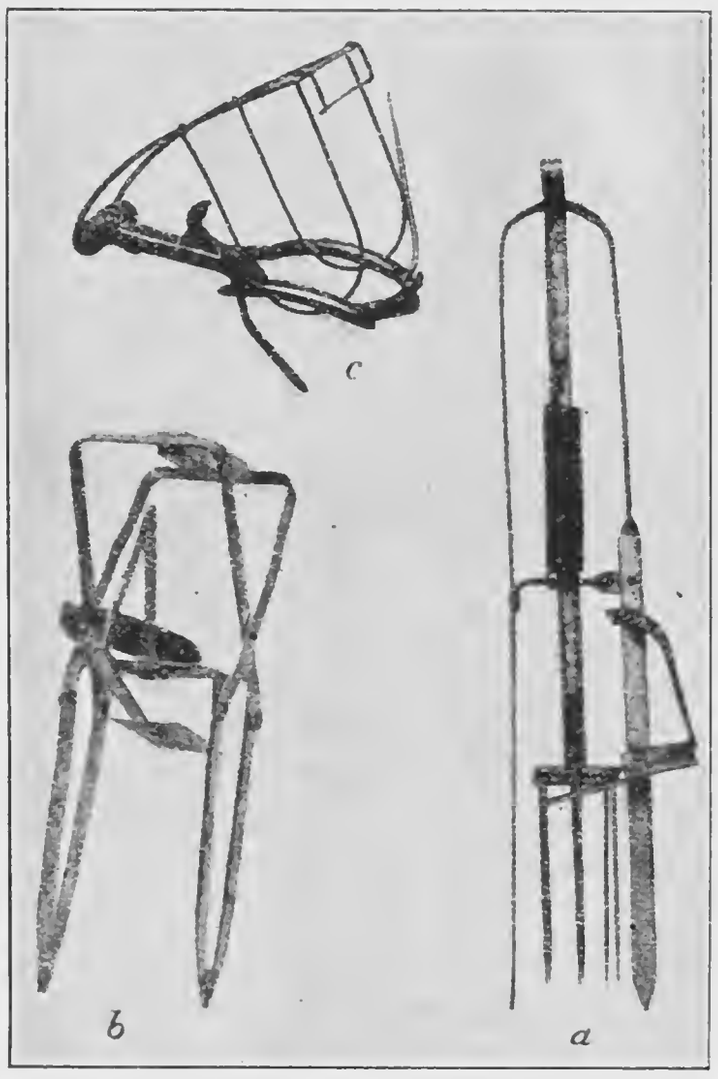
ALL sorts of expositions are being held. A new one will open next April in Milan, Italy. This will be an exposition of stone. It will show the development of marble, granite and stone working. There are many of us who could supply several miles of stone wall of very high quality to such an exposition.

THE COMMON MOLE.

A Subterranean Invader in the Lawn.

WE never had so many questions about the common mole, and how to destroy it, as are coming this year. The Department of Agriculture at Washington has issued Farmers' Bulletin 583. This is from the Biological Survey, and gives a very good account of the mole and its habits. Most of our readers are familiar with the work of this little animal, having seen his ridges or runways on the lawn, through the garden, or in the field. The mole is a great nuisance on the lawn, making his way just below the surface, and leaving a ridge along the ground. Hundreds of people have tried to kill him in ordinary ways and failed. The mole eats little if any vegetable food. Now and then seeds or other vegetable matter may be found in his stomach, but the great bulk of his food appears to be earthworms and white grubs, or ants and cutworms. Moles have been captured alive, and kept for a time, to observe their feeding habits. They were found to eat ravenously of beefsteak, bird flesh, fish, or almost anything in the way of fresh meat. A very few eat green corn on the cob, but most of them starved to death when supplied with potatoes, sweet potatoes, or ordinary vegetables.

Some of our people are sure that the moles destroy vegetables, as they claim to find their evidence of this in the runways. They must remember that other animals, like mice, also use these runways at times, so that the mole gets the discredit of helping himself in the garden. As a matter of fact, except for the damage it does in raising the ridge along the lawn, the mole ranks with the skunk as a destroyer of white grubs and injurious insects. If he would keep out of lawns, parks, cemeteries, or flower beds, the mole instead of being a pest would be one of the most useful little animals we could have on the farm, and yet the nuisance he creates by digging along our lawns and gardens makes it necessary for us to put him out of business. The only successful way of doing this is to trap him. Fig. 318, taken from the Farmers' Bulletin, shows three types of these traps. The form shown at A has been very satisfactory with us. It work with a powerful spring, and when set the sharp harpoons are pulled up and set with a spring. Then the trap is driven into the ground right over the runway. The mole, working along through his burrow, snaps the trap, the harpoons plunge down and pierce him in the ground. We have found no better way to catch the mole than by using one of these traps.



TYPES OF MOLE TRAPS: *a*, HARPOON TYPE; *b*, SCISSOR-JAW TYPE; *c*, CHOKER TYPE. FIG. 318.

MAKING AND SAVING GOOD HAY.

THE time to cut clover for hay is when the plant is in full bloom, or, in other words, when one-third of the heads have turned brown. At this stage it is about 80 per cent water, and it cannot be stored safely if it contains over 25 per cent, so the problem of curing clover hay is simply that of evaporating the difference between 80 per cent of water and about 25 per cent, or reducing the water content to 25 per cent or less. In order to do this quickly, or in from 24 to 36 hours, it must be done through the leaves. As soon as the stem is separated from the stubble the supply from below ceases, while the evaporation from the leaf continues as long as it has life in it. In order to secure this quick evaporation air must have free access to the leaves. Hence the problem of curing clover is to keep it in as loose form as possible.

CURING CLOVER.—When the crop is heavy and the sun hot the leaf structure of the upper part of the swath is often killed, as is shown by the leaves becoming brown or black, while those in the under part of the swath are scarcely changed in color. Hence the value of the tedder in lifting the swath and allowing free access of the air. Unless this is done the clover is sunburned, and if the leaf structure is killed before the sap is out of the stalk it is impossible to make good hay, nor can the curing be done in any reasonable time. It is impossible to cure clover hay during damp, muggy weather. It is, however, an easy matter to cure it in clear, sunshiny weather with a fresh north or northwest wind. In fact it is easy to cure clover hay if the atmosphere is very dry with sunshine and any kind of a breeze. The problem therefore is to keep the clover so loose that it is quickly converted into hay by the evaporation of the moisture through the leaf, and before the leaf structure is destroyed by the hot sun. With good weather clover in the condition above described can be cut one evening, tedded or put in small windrows before dinner the following day, and hauled in during the afternoon. Where one has only a few acres of clover probably the best method of handling is to cut and allow it to wilt, put it in cocks, then cover it with hay caps and let it go through the sweating process in cock. This is not practical when there is a large acreage, however.

AN ERROR IN PRACTICE.—A good many farmers when rain threatens make the mistake of putting their hay in windrows. It should be remembered that clover will suffer less injury from rain even when dry lying in the swath than it will if put in windrows, or even in small, loosely-built cocks without covering. I have seen many farmers hasten when rain threatened to put their hay in cocks, only to have it wet through to the bottom, and I have never seen any good hay come out of these soaked bunches after they were shaken out.

STORING THE HAY. FIG. 319.

THE HAY LOADER SAVES LABOR. FIG. 320.

HANDLING TIMOTHY.—Timothy is at the best stage for cutting when it is in full bloom. If one has a large amount of grass of the same grade to harvest, a beginning should be made a little before the best stage for cutting, so as not to lose from being overripe. If the day is bright and breezy I proceed as follows: I start the mowing machine about nine o'clock in the morning, and stop the same as soon as I think there is sufficient grass cut to handle during the day. If, however, I have suspicion of foul weather I stop the machine before I think there is half enough down, as it is better to secure one or two loads of hay thoroughly well made than to have twice the quantity partly spoiled with a rain shower. I start the tedder about one hour after starting the mower. If the Timothy is very heavy it is given a second tedding, going in the opposite direction. Then about noon I start the rake, and about an hour later commence hauling, and clean up the last swath before seven o'clock in the afternoon. After the hay is in the barn the latter is tightly closed at night. There is no danger of heating or molding in the mow if the Timothy is cut when the bloom is on the head, and mowed away without any rain or dew on it. The hay will come out in the Winter bright green in color, and it will be worth almost as much to feed and the stock will relish it almost as well as the grass it was made from. There is a good deal in arranging machinery to work together. A tedder works better if it takes just two swaths of the mower, and a rake is more satisfactory when it is wide enough to gather in three swaths. This of course requires two horses, but it pays, because hay must be handled quickly.

HARVESTING ALFALFA.—The proper time to cut Alfalfa is when it is from one-fourth to one-half in bloom, provided there is good weather for curing it. When the usual time for harvesting the crop approaches it begins to prepare for it as though it were a foreseen event by throwing out buds near the root, thus forming a crown. If the Alfalfa is cut before it has prepared itself by throwing out these buds or new shoots from the root it will not do anything in the way of growing until it has time to start these shoots. That may be a matter of a week or 10 days. In the meanwhile weeds will fight for the possession of the land, and therefore if the Alfalfa is cut too early there will inevitably be a short crop following. On the other hand, if it is let go too late the plant will throw its strength to the shoots, and the main stalk will begin to crinkle down. It will go on and produce seed, but as a seed crop detracts very much from the next cutting.

CURING THE CROP.—There are two ways of handling this crop. One is to cut it at the time specified above, allow it to wilt, put it in cock, then cover with a cap and let it stand for a few days. Then on a clear day remove the cap, open up the cock, air it and sun it, and then put it in the mow. The other method is to cut it in the evening or early in the morning, after the dew has dried away, and put it in small windrows. Then when by taking a wisp of it and twisting it hard no moisture can be seen on the outside it is ready to be put in the barn. The first is the safest way so far as the present crop is concerned, but the objection is that if the cocks stand on the ground more than a day or two the Alfalfa underneath will be killed, and the field will be badly spotted. Alfalfa is no more difficult to cure than clover, provided there is the same amount of heat, wind and sunshine. In fact, it is scarcely as difficult. Whichever method is adopted the great object in curing Alfalfa is to preserve the leaves, and it should not be allowed to stand until after they have begun to fall, which they will do shortly after the new shoots from the root are an inch or so in length. The greater part of the nutriment in Alfalfa is contained in the leaves. These are worth more than their weight in bran. Caring for hay to avoid as much waste of its feeding value as possible is important. A great amount of hay is stacked out of doors and allowed to take all kinds of weather, causing a continuous waste.

Illinois. H. C. W.

FARMERS' CLUB

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

Peach Leaf-curl.

I HAVE a peach orchard I did not spray with lime-sulphur which has a fair crop of fruit and a rather bad case of leaf-curl. Can you tell me of any spray that would have a tendency to check it? The trees are about six years old, varieties Elberta, Salway, Fox Seedlings, Carman, Belle of Georgia and Crawford's Late. M. G. S.
Smithsburg, Ind.

Unfortunately for M. G. S. there is no method of checking an attack of peach leaf-curl appreciably within one season if it once gets a good start. He can, indeed, spray immediately, and again in about four weeks, with S-S-50 self-boiled lime-sulphur, with about two pounds of arsenate of lead to the 50 gallons. Such treatment is good orchard practice as a preventive of brown rot and other troubles, and will exert something of a checking influence on the leaf curl, but cannot be expected to abate the attack greatly. The virulence of the attack will gradually disappear anyway as the season gets warmer, and no more serious damage need be expected until next Spring. At that time, however, if the proper preventive measures are not taken *before the buds open*, a repetition of the attack will likely occur unless the weather be unusually dry and warm at leafing-out time. The proper dormant spray to use for the control of this disease is boiled lime-sulphur diluted to 4.5 to 5 degrees Beaumé, *but this is not a safe spray to use after the trees are in leaf.*

C. A. LUDWIG.

City Boys as Farm Helpers.

AT this season we are overrun with calls from students and city men who want work on the farm. These young men expect good wages and agreeable board, but usually have no skill to offer. We have written some of our best farmers and fruit growers, asking if they want such helpers, and what such men are worth. The following letters are typical of many others. We do not tell what these farmers should do—we tell just what they say:

My experience with that class of help has been that they are good for nothing; they come out to have a good time. I have spent time and money on them, but would not take them if they would come and work for nothing and board themselves. That is about my neighbors' experience, as I was the means of getting them here. They want big wages, the best room in the house, wife and daughters to wait on them, parlor with someone to entertain them, so they can show off their white tennis and baseball suits and try to show what they think is their superiority over the country.

J. A. HEPWORTH.

The college student expects too much and is inclined to give little in return. A few farmers and fruit growers have employed such labor and "put them through," giving them the "raw" end and not caring for criticisms afterward. Some of the graduates of agricultural colleges are a "fright," a disgrace to any institution, absolutely lacking in horse sense, even candidates for higher degrees, and yet sons of farmers are required to pass up two and three years each of three foreign and "dead" languages in order to pass entrance requirements. A prominent Jersey farmer with "husky" sons, employs college men with farm experience and says "you need do no more than my sons." He grows a very large acreage of hay and gives them five to six weeks of haying. Western New York fruit growers as a class are prejudiced against inexperienced students and city labor during Summer vacation; their employment is a constant source of nerve-racking to the employer and tends to disorganize regular employees. A prominent agricultural educator recently remarked, "It is not what they (students) can earn, but how much more damage than good will be done." Agricultural college entrance requirements should include at least one year's work on an up-to-date farm. W. E. C.

CUSTOMER: "I want something for fleas." Drug Clerk: "Why don't you get a dog?"—Judge.

BOSTON MARKET REVIEW.

THE general condition of green stuff in Boston market is fair supply and reasonable prices on most goods which are heavily used by consumers. The exceptions to this general rule are onions, lettuce and apples. The onion supply is lessened through short crop in Egypt and Texas, which both usually send the main supply at this time of year to our market. Old natives bring the unusual price of nearly $5 per 100-pound bag, while the others bring about the same figure per bag, and $2.75 per crate. Potatoes hold firm under medium supply, and only light demand the last few days has kept them from taking a raise which will come at any time now, as Southern new ones will be late in reaching our market in any quantity, and reports do not promise a large crop from most sections. Good firm old turnips are high, bringing $3 per bag, and White Eggs $1.50 and better per bushel. Old beets, if good, $2 per box; carrots about the same. New bunch beets and carrots $1.50 and $1.00 per dozen bunches. Southern Summer squash $1.50 to $2.00 per crate. Cucumbers $5 per box for No. 1, others $4, $5 and $2.50. Southern cabbage $2.50 per crate; California celery $2 per dozen. Southern beans $2 to $2.75 per basket for green and wax. Spinach about $1.50 per barrel. Southern kale $1 per barrel. Native Asparagus just coming in, and sells at $4 and $4.50 per box; California about $2 per dozen, while the supply from Pennsylvania and Jersey sells at $2 to $3.

Native apples reach $8 per barrel for best Baldwin, with Russets at about $5; box fruit $2 to $3. Western box fruit $3.50 to $4 for Delicious and Winesap, others at $2.50 are quickly taken. Grapefruit $3 and $4 per box, Cuban about $3; lemons $2.50 and $3; oranges have reached a high figure, most of them bring $3.50 to $4.50 per box. Bananas fairly plenty at $3.25 for best large fancy fruit, good bunches at $2 to $2.75; small bunches $1.25 and $1.50 for yellow, while reds bring about $1 per bunch more on each grade. Plenty of pineapple make prices reasonable, and more are shortly expected; $2 and $3 per crate is the figure. Strawberries quite plenty and bring 10 to 20 cents per box. These will rule low, as native will be with us in a week or two baring mishaps.

Egg receipts are moderate, which might be applied to the demand also, and probably 50 per cent. are being stored for future use. Prices range from 26 and 27 for fancy fresh nearby, while good fresh medium stock goes at 24 and 25; good quality Western stock also goes at 24 to 25, others around 23 for most sales. Live poultry in fair demand with supply about right to fill orders. Hens and chickens bring up to 17½ per pound; roosters about 12, with good fat ducks going at 18. Dressed stock 17 to 22 for fowls; ducks 20 to 21.

Butter is slowly rising in price for very best quality, which is short, and sells up to 30; good quality also sells well at 27 and 28 by tub; poorer grades are still plenty, and prices are about from 24 to 26; dealers are anxious to sell these grades whenever possible. Cheese is moving in small lots at moderate prices. New cheese from grass not on the market much; prices on good common cheese average 14 to 15. Some fancy goes at 18.

Milch cows in small demand and prices easier; average cows brought around $60, some milkers at $50, a few at $40. Young bulls $25. Horse trade good on best grades of drafters, and prices satisfactory to seller at $350 up to $475 each, lighter grades sell more slowly, but demand is fair on these, and prices range from $150 to $300.

Hay market a little off in prices, as supply more than equals demand this Spring by a slight margin, and prospects are now good for a large crop for this season; best $23; other grades $14 to $20. Not much drop in grain as yet, but advices are not to buy in heavy supply, as a lower level is shortly expected. Mixed feed $28 to $30 per ton; cottonseed meal about $33; gluten $29; cornmeal $1.45 to $1.50 per bag. A. E. P.

Amatite
The Roofing that Needs No Painting

WHEN your roof is covered with Amatite, there is an end to the roof painting nuisance. Amatite has a real mineral surface and needs no painting. You don't have to get up on the roof every two years and paint it.

The mineral surface makes this unnecessary and it will stand rain and hail and wind and snow, for years without attention.

When you paint the old-fashioned roofings you are practically trying to keep them from getting wet. Amatite is made to get wet, for water won't hurt it a bit. Next time your old-fashioned roofs need painting, cover them with Amatite.

A sample of Amatite and booklet about it will be sent free on request. Address nearest office.

DIGGERS
for potatoes—4 styles to choose from to suit your special conditions. We guarantee them to do the work we claim for them. All growers know that it pays to use diggers even on five acres—they save much valuable time and save all of the crop in good condition.
IRON AGE DIGGERS
No. 155 For Heaviest Conditions
Wheels, 32 or 28 inch. Elevator, 22 or 20 inches wide. Thorough separation without injury to the crop. Best two wheel fore truck. Right adjustment of plow, shifts in gear from the seat. Can be backed, turns short into next row.
Ask your dealer about them and write us for descriptive booklet.

35 BUSHELS PER ACRE was the yield of WHEAT
160 ACRE FARMS IN WESTERN CANADA FREE
on many farms in Western Canada in 1913, some yields being reported as high as 50 bushels per acre. As high as 100 bushels were recorded in some districts for oats, 50 bushels for barley and from 10 to 20 bushels for flax. J. Keys arrived in the country 5 years ago from Denmark, with very little means. He homesteaded, worked hard, is now the owner of 320 acres of land, in 1913 had a crop of 200 acres, which will realize him about $4,000. His wheat weighed 68 lbs. to the bushel and averaged over 35 bushels to the acre.
Thousands of similar instances might be related of the homesteaders in Manitoba, Saskatchewan and Alberta.
The crop of 1913 was an abundant one everywhere in Western Canada.

"LOOK FOR THE SPRINGS"

Give Your Crops the Food They Need
You can increase both the quantity and the quality of your peas, beans, alfalfa, clover, vetch, all legumes, by inoculating the seeds with
Ferguson's
NITROGEN BACTERIA
The experience of many users has proved the wonderful results Ferguson's Bacteria will give. Seed inoculation is no longer an experiment. We have hundreds of letters from users telling of wonderful success. Let us send you copies of these letters.
Ferguson's Bacteria gather Nitrogen—the food plants must have, and which is scanty in most soils. They gather it from the air and store it upon the roots of the plants, using part for the present crop, leaving the rest for the future. The same bottle contains all the varieties of Bacteria necessary for the inoculation of any legume.
Quarter-acre quantity, 50c.; 1 acre, $2; 5 acres, $9. Let us explain why you need Nitrogen Bacteria and why Ferguson's is best. Write for special booklet N—free.
We want agents—a very liberal offer.
HOMEWOOD NITROGEN CO., 51 Liberty Street, New York City

The Home Acre.

More About Peach Borers.

ON page 717 I read the article on killing the peach borer, having had no experience in digging them out. I have a few fine trees and never noticed signs of borers until I saw the gum this Spring. On scraping with a knife I found some holes almost grown over and others with old dead sawdust in them. It looked as though the borer was not at home. Will you tell me when and how to look for the borer and take him out? F. W. T.

Bardwell, Mass.

We have known the borer to dig five inches or more under the bark, straight down the tree. The only way to make sure of him is to take a wire with a little crook at the end of it, and push it down the burrow to the end. By working it around, and pulling it out, you will generally drag out the borer, if he is there. Our own plan is to scrape off the gum; then with the sharp pointed blade of a knife slit the bark down over the burrow to the bottom. Do not cut across, but cut down, digging out the bark over the passage made by the borer. If he is at home you will find him at the bottom, often below the ground. At this season he has about done his work for the year, and could hardly do more damage. The best time to hunt for borers is in the Fall. They are then rather small, but have not done much damage, and by cutting down their passage they may be found and destroyed before they injure the tree. This cutting out plan is the best we know of. Next to it in efficiency will probably come the plan of painting or spraying the base of the tree thoroughly with a lime-sulphur wash.

HUSTLING THE PIE PLANT CROP TO MARKET. FIG. 321.

Notes from a Maryland Garden.

IT is the third week in May, and the third planting of corn for roasting ears is coming up. The first planting was made in April of the Early Norfolk Market corn. This is a great improvement on the old Adams Early, the ears being longer and the crop earlier. I usually plant this in March, but this Spring there was no corn-planting weather in March, and it was April before the seed went into the ground. The later plantings are the Country Gentleman, for though some of the extra early sweet corns are of good eating quality, like the Golden Bantam for instance, we get too little here from these to make it pay to occupy space in the garden with them. The Norfolk Market corn is of course not a sugar corn, but it is early and we get larger ears, and the quality is not at all bad. Then too, it can be planted earlier than any sugar corn, which would be apt to rot in the cool weather of early Spring. Any ears are good when we can get them by the 20th of June.

Along the wire fence at the north end of the garden I have Berger's Green pod beans. These are a great improvement on the old Dutch Caseknife bean, make nice string beans and the ripe beans are as good as navy beans, which we cannot grow well here. This would be a very fine bean to plant in a cornfield, but in the garden I cannot afford to let the cornstalks stand as bean poles, for as soon as the ears are past value for the table the stalks are pulled out, and the ground prepared for a later crop.

This cool Spring has been a wonderful season for the rhubarb, and we never had a better growth of the Linnaeus. The chard, sown thickly, is now getting quite thick along the rows. I sow this rather thickly because the young thinnings are the best of all substitutes for spinach, and we can get many messes in thinning the plants out to six inches apart, which is as close as they should stand for the full development of the leaf stalks, which we boil like asparagus later.

And the cool weather seems to have suited the asparagus too, for the stalks are of unusual size, thanks to the heavy manuring last Summer after cutting stopped. That is the time to prepare for big asparagus shoots, getting the strong growth on the roots in the Fall to make strong crowns for the Spring. Now, as soon as cutting stops, we will pile on the manure and fertilizer, and cultivate the plants clean the rest of the season, knowing that they are storing up food to make fat shoots next Spring.

The early Queen onions have all been used, and now we are using the offsets of the Yellow Potato onion for green onions. These clean off perfectly white and are now in fine shape for the table, while the main bulbs can go on to ripen. These were planted last Fall, and the soil banked over them as a Winter protection to the bulbs. This has now been pulled away to allow the bulbs to swell and form on the surface.

The dasheens are starting, and I hope to get a crop of larger corms than the dry weather last Summer allowed me to get. My crop last Summer made such small corms that I did not test their eating quality, and hope to get some next Fall that we can use on the table

In the flower line, the Dahlia seed, sown in the open border, is now up. I never start these inside early, for sown in the open ground the plants come into bloom just in the best Dahlia weather of the Fall, and as I sow some seed every Spring I have selected from time to time a collection that is hard to beat among the named sorts offered. But more of the flowers later. W. F. MASSEY.

Maryland.

Destroying Chickweed.

OUR entire farm is infested with chickweed. Even the old grass fields are showing it. Is it to be taken as a serious pest? How shall we rid farm of it? MRS. C. L. R.

Purcellville, Va.

Chickwood is becoming to be a serious pest in some parts of the country, especially in trucking sections, with such crops as strawberries and Fall-sown crops, as kale. Owing to its early maturity it does its principal damage in early Spring before ordinary crops have a chance to grow. When it occurs in hay, clover and Alfalfa fields it seldom does more than temporary damage. Alfalfa matted with it the first Spring after seeding may not have any more after that. There is no remedy for getting rid of it, other than keeping it from going to seed. Spraying with the chemicals ordinarily used for killing other seed have very little or no effect. Shading to kill it out cannot be practiced, because at the time of year when chickweed is growing the most rapidly other crops make very little or no growth.

KODAK

Keep an accurate record

of your farming operations and illustrate that record with Kodak pictures. An album of Kodak pictures, with explanatory notes on methods of tillage, drainage, fencing, building, breeding and the like will make a valuable reference work that will help you plan for the year to come. Experience is the best teacher—but you need records of such experience. Let the Kodak help.

Ask your dealer to show the Brownie Cameras $1.00 to $12.00, or Kodaks from $6.00 up. Catalogue free at the dealers, or by mail.

EVENTS OF THE WEEK.

DOMESTIC.—May 20, Chas. S. Mellen, in testimony at Washington, told of the acquisition by the New Haven of the Rhode Island trolleys at a cost of between $19,000,000 and $20,000,000. These trolleys are now losing the New Haven between $300,000 and $400,000 a year, and Mr. Mellen acknowledged that the railroad had paid twice their value for them. Mr. Mellen declared that ex-Senator Nelson W. Aldrich had been active in bringing about this transaction. As the result of this testimony, light is beginning to break on the transaction in Boston and Maine stock by which John L. Billard of New Haven made $2,748,000. The evidence seems to indicate that the New Haven's holding of Boston and Maine was sold to Billard in order to evade a Massachusetts law, and was bought back as soon as this legal obstacle was removed. Billard refused to regard the transaction as a mere accommodation and kept the profit, although the minutes of the New Haven board of directors showed that strenuous efforts were made to get him to give it up.

The Federal Grand Jury, at Pittsburgh, Pa., May 21, recommended the indictment of five employees of the Carbon Steel Company on a charge of conspiring to defraud the United States in connection with steel furnished for the locks of the Panama Canal. The steel is alleged to have been of a very inferior quality, with the exception of the ends of the beams and plates, which were highly tempered, so that when the Government inspectors chipped a piece off the ends to have the steel analyzed they would secure only the highest grade metal. The steel furnished by the Carbon Steel Company is alleged to be of such a low quality as to make its use in the locks and gates unsafe. The gates and locks which contain this low grade metal are likely to collapse at any time, it is alleged.

Between $312,000,000 and $313,000,000 is the sum which will be placed opposite John D. Rockefeller's name on Cuyahoga county's personal tax duplicate at Cleveland, Ohio. Mr. Rockefeller failed to make a return May 23, as ordered, and county tax commissioners immediately began a compilation of a list of his tangible and intangible personal property.

Fire in lumber yards on the flats at Cleveland, Ohio, May 25, caused a loss estimated at $1,000,000 and destroyed a large portion of the Central viaduct, which connects the south side with the business part of the east side.

A compromise agreement was reached May 26 between the Administration and organized labor concerning the provisions in the anti-trust bill covering the rights of labor under the proposed law. The compromise forestalls a fight in the House which labor confidently expected it could win by an overwhelming majority. The compromise contemplates that the Democrats of the Judiciary Committee shall offer two amendments to the pro-labor paragraphs. These will have the support of labor adherents and Democrats generally. The amendment covers the section providing that labor, fraternal and agricultural associations formed for purposes of mutual help and not profit shall not be prevented from organizing and carrying out their legitimate objects.

MEXICO.—A general plan for the pacification of Mexico, covering several of the important points at issue, has been drawn up by the A. B. C. mediators. This plan has been agreed to by the United States and Huerta delegates. Justice Lamar said May 26 that the outlook for a satisfactory settlement is now "extremely favorable." Carranza remains, however, a stumbling block in the way of peace. The Constitutionalist leader maintains his stand for the absolute elimination of Huerta and the Cientificos. He regards mediation regarding the internal affairs of Mexico as an unwarranted meddling on the part of the South American diplomats and the United States. . . . Army and navy officials in Washington are preparing for the moving of United States troops to Mexico City when Villa enters Huerta's capital. It is feared that a reign of terror will follow the occupation of the capital by the rebels. . . . John R. Silliman, the American Vice-Consul, who was imprisoned by the Federals at Saltillo, arrived May 26 at Vera Cruz. He is still suffering from fever brought on by the hardships of his journey to Mexico City from Saltillo. . . .

FARM AND GARDEN.—Three students in the agricultural department of Columbia University have started, through the efforts of Prof. O. S. Morgan, head of the department, experimental work in agriculture on a six-acre plot in Madison, N. J., part of the Nathaniel Niles farm. If the results are satisfactory it is possible the university will establish an experimental farm on which all its agricultural students will work. Through the Summer the three young men will cultivate the ground, each as if it were his individual enterprise, save for the fact that a man who has had both practical and college experience in agricultural metho will act as adviser. Not only will they raise their own products but they will market them.

Fifteen thousand additional farmhands will be needed in Oklahoma to harvest the 1914 wheat crop, State Labor Commissioner Daugherty announced May 23. He estimates the crop at 40,000,000 bushels, the largest the State has ever produced. Harvesting will begin in the southern part of the State the first week in June, and will continue thirty days.

The Chicago *Daily Tribune* of May 16 states that the firm of Rosenberg & Lieberman, wholesale seedsmen of Milwaukee, was fined $400 recently for the fraudulent use of the mails, of which charge they were indicted last November. The firm advertised itself as specialists in dry land Montana grown Alfalfa seed, urging that this seed is grown farther north than any, and was a better drought resister than others. The firm also obtained the O. K. of the Agricultural Station of Wisconsin, and called its chief brand "The Government Brand," yet they had purchased Alfalfa seed not only from Europe, but from the section that they had cautioned their customers against, and only a small portion of their purchases came from Montana.

COMING FARMERS' MEETINGS.

Pennsylvania State Horticultural Association, Summer meeting, State College, Pa., June 17-18.

American Association of Nurserymen, Cleveland, Ohio, June 24-26.

Georgia State Horticultural Society, Summer meeting, Griffin, Ga., August 5-6.

Indiana Apple Show, Tomlinson Hall, Indianapolis, Ind., November 18-24.

The Massachusetts State Board of Agriculture will hold its Annual Summer Field Meeting at the Hood Farm, Lowell, Mass., on Wednesday, June 24, 1914. Lectures and demonstrations on topics of interest to farmers are being arranged. All sessions will be free to the public.

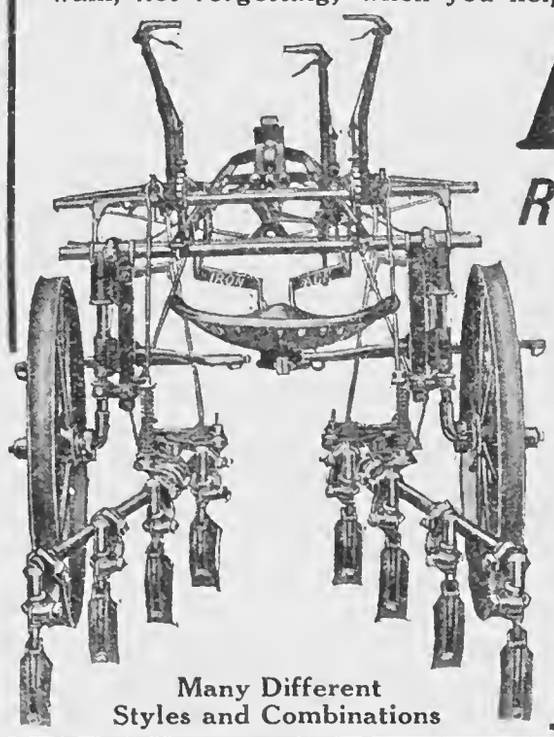
May 20. William H. Reid and Secretary Taylor of the N. J. Horticultural Society were present at a largely attended session of the Oak Grove Grange at Pittstown to explain the workings and aims of the State Society. It was followed by an interesting discussion of fruit growing. Hunterdon County has a prospect of a good crop of fruit on the few orchards left in that section. H.
Riverton, N. J.

May 19. We have had a cold Spring, frost May 18, and the ground is just getting ready to plow, soil mostly clay, some red loam. Few have anything planted except peas and a few potatoes. Many farmers here are to plant squash for the factory, getting $8 a ton. Many also raise raspberries, and almost everyone raises poultry and ships eggs to the Boston market. The trees have not as yet leaved out, but are just started. Hay in the barn is worth $11 to $12; corn, bran, meal, and most feeds are $1.60 per 100-pound bag; oats 54. Eggs from 20 to 22 here in the market; those shipping get 25 to 27 and deduct three cents express. J. C. S.
So. Thomaston, Me.

"DID the husband of that militant suffragette who was always longing for peace ever find it?" "He has found comparative peace. He is with the army in Mexico."—Houston Post.

HELP YOUR HELP

By furnishing them "fool proof" implements which do the best quality of work with the least effort, permitting them, where possible, to ride instead of walk, *not forgetting*, when you help your help you help yourself.



Many Different Styles and Combinations

IRON AGE RIDING CULTIVATORS

Carry every possible adjustment of teeth, gangs, wheels, frame, etc., to care for all row crops in any kind of soil. They are built with high or low, pivot or fixed wheels, grooved, flat or zig-zag gang bars, for one or two rows and with many attachments for special work.

Ask your dealer to show them and write for booklet, "Two-Horse Riding and Walking Cultivators."

Also full lines of potato machinery, sprayers, and garden tools.

LEGAL QUESTIONS.

Proof of Claim Against Decedent.

I am running a hay press, and I baled hay for a man named T. A. When I moved it in the barn I asked him if he would pay for half of the baling, as P. M. had cut the hay on halves and he said that he would, and his daughter A., who was at home, said so too; and I baled the hay. When I got through baling, he did not have the money and said he would pay as soon as the hay was delivered. T. A. died and, after the funeral was over, I went down to collect the money and found a change. T. A.'s other daughter M., from New York, had taken possession and she said that she owned everything there, the farm and all, for the last seven years; but she had permitted her father to have the use of it as long as he lived and, when he died, everything was hers, and she would not pay one cent of my bill. Can it be collected? M. S.

New York.

This bill surely ought to be collected. If this lady owned the farm all this while, then her father acted as her undisclosed agent and she, having received the benefit of your work, cannot now say that she will not pay for it. If the daughter proves that the property is hers and will not pay the bill, you should bring an action against her to collect it; if it is not hers then you can file a claim against the estate of the father.

Septic Tank as Nuisance.

Will you inform me how close to a dwelling a septic tank can be placed according to law? The village of Eastwood is putting in a tank at the back of my place, which will spoil the sale of at least 10 building lots for me, as it is placed in a position which otherwise would have been made into a street. Will you advise me if I have any redress in the matter and what steps to take?

New York. R. M. P.

There does not appear to be any law regulating the distance from a dwelling at which a septic tank can be placed. If this septic tank will prove a nuisance, injurious to the health, you may complain to the local board of health and they must take action to remedy it, and if it is otherwise a nuisance but not injurious to health, you may take legal proceedings to have the nuisance abated; but at the present time there appears to be nothing that you can do except to use your persuasion upon the village authorities to have it located at some other place. In all these matters of improvement someone is liable to suffer inconvenience so that the majority may be benefited, but you cannot be made to suffer in health for the benefit even of a village or city. Your best plan of action would seem to take this matter up with the local board of health.

Support of Wife and Children.

I having cause to leave my wife and two children, nine days after she had me arrested charging me with desertion and non-support. I support my two children, pay $16 a month, but do not support my wife; but she keeps the two children. We had separation papers issued two years ago, which will be up August 23rd. If I call on my wife with a witness and ask her to come and live with me again, as her home is there if she will come, by doing this if she refuses to do so will I have to support her or not? At the hearing she said she did not want anything, she just wanted support for her children and she would work for her living. This statement was made in presence of three witnesses. F. W. D.

Pennsylvania.

It would appear from the reading of your letter that your wife has obtained a separation from you and that you are to pay $16 per month for the support of the two children who live with her. Whether you can ask her to come back to your home would depend upon the terms of the separation decree. If there is nothing to the contrary in the decree, or is not provided otherwise, and you offer to provide a good home for her where you will be kind to her, it is always her duty to come back to you. You must understand that you cannot use this request merely as a ruse to get rid of paying for the support of your children, but if you are in earnest and intend to treat your wife properly and support her, she should come back.

Regulation of City Markets.

A lot of market gardeners have formed an association for the purpose of getting better market facilities in Newark, N. J. The present authorities of Newark are driving us out of our present market site without providing for another suitable place for us. Now we contemplate buying our own site and establishing a farmers' wholesale market governed by farmers. Must we get a permit from the authorities of the community we locate in to establish such a market? If so can they refuse it? D. H.

New Jersey.

The regulation of public markets and the provisions for erecting new ones are governed entirely by the State laws respecting the erection of markets in cities and by the city ordinances of Newark. The State law provides that whenever in the judgment of the common council or other governing body of any city market facilities or additional facilities are or may be required for public uses the common council shall appoint commissioners to purchase such lands and erect buildings thereon to be used as a public market, and provision is made in the city ordinances for one market called Central Market. If you contemplate locating a new market in the city you will have to get the consent of the city authorities; probably of the committee on public markets. If you have had trouble with the market committee, it probably will not be an easy matter to persuade the common council that a new market is needed. And if they come to the conclusion that the market facilities at present are sufficient, they could refuse to authorize the building of a new market. If you are properly organized and can make noise enough and can get a hearing in the city newspapers, the council might deem it advisable to give you a permit to establish a new market.

Two Irishmen were washing windows on the tenth floor of a London building, and one of them lost his footing and fell to the pavement below. His frightened companion ran down the stairs and had just reached the fallen man's side as the doctor said: "I guess the poor fellow is dead." At that the injured man opened his eyes and said: "Oi'm not dead." "Keep quiet," said the other Irishman, "sure the doctor must know best."—Credit Lost.

Tire Prices That We Call Unjust

Let men, if they will, claim a tire as good as the Goodyear No-Rim-Cut tire. But don't let men claim a better tire to charge you a higher price.

Bear in mind that Goodyear tires hold top place in Tiredom. They outsell any other. After millions of tests, men are adopting them faster than ever. Our this year's sales break every record, by 55 per cent.

And these tires offer four great features found in no other tire. Compel the men who ask higher prices to show some reason for them.

From $5 to $15 More

Sixteen makes of tires now sell above the Goodyear prices. The price per tire will often run from $5 to $15 more.

The reason lies in our mammoth output, our factory efficiency, our modest profit. It results from Goodyear popularity. Those extra prices, we can prove to you, are utterly unjust.

Four Things Lacking

These four things are lacking in every other tire:

Our No-Rim-Cut feature—the only feasible way to end the ruin of rim-cutting.

Our "On-Air" cure—an extra, costly process which saves the countless blow-outs due to wrinkled fabric.

Our rubber rivets—hundreds of which are formed, during vulcanizing, to combat loose treads.

Our All-Weather tread—the anti-skid which runs like a smooth tread. A tough, double-thick tread with deep, sharp, resistless grips.

No extra price buys these things, nor anything that's like them. Nor can it buy a better tire in any other way. Can you think—with our prestige—we would let any maker give you more than Goodyear gives?

If not, get Goodyear tires at Goodyear prices. Any dealer will supply them.

Hope Farm Notes

FARM NOTES.—We began spraying for Codling worm May 22. This is a little later than usual, yet we would willingly have waited a little longer, but there is so much of it to do and so many windy days that we began early. This year produces stronger arguments for the power sprayer. We could not begin to handle our proposition with hand-power pumps. The worm waits for no man, and the gasoline hired man beats any flesh and blood at the pump. It will be a race for us anyway to get the last of the poison on before the worms get at the apples. As usual we use three pounds of arsenate of lead and one gallon of lime-sulphur to 50 gallons of water. The lime-sulphur adds to the sticking power of the mixture and has some effect upon leaf diseases also. Some of our people complain that filling the tank is a nuisance. We have a little dam in a spring brook, thus making a small pool. The lower end of the tank filler is put in this pool and the engine pumps up the water well strained. We can fill the 250-gallon tank in less than 10 minutes, and have the spray material ready meanwhile.

The Marshall strawberries promise a great yield this year. I never saw this variety make more bloom. The soil is full of moisture and the mulch prevents evaporation, so it looks like a sure thing for the crop. We have one five-year-old bed. It will give a fair yield this season, but is so foul with grass and weeds that it would not pay to clean it up. It is an eyesore and something of a disgrace to a strawberry grower, yet we shall pick some of our finest berries out of this sorrel-shaded field. As soon as picking is over that field will be plowed and planted to celery. We have the seed started under straw. Thus far we have failed with the celery crop, but this year we try again under better conditions.

The Redheads are trying their hand at raising a few baby chicks which came to us by express. These chicks are kept over night in a "fireless brooder" or ordinary wooden box. There is litter at the bottom, and an old coat is thrown over it at night. At first this was put beside the stove at night, but when the chicks began to jump out and run over the floor the chief cook objected. On sunny days the chicks are put out on the grass in a wire-topped box with no bottom. Those little Leghorns are doing well with this rather crude treatment. The boys also have two Red hens patiently sitting on 24 eggs, which came from a flock of cross-bred hens famous for their laying qualities.

As June approaches the prospects for our fruit crop grow brighter and better. We are now sure that the peaches got past the cold weather. The trees are loaded with fruit, some of it already as large as Delaware grapes. Brown rot, "June drop" and half a dozen enemies are still ahead, but we expect to get by them with a fair crop. I understand that north of us the crop is light, and that some growers who often sell 1,000 baskets or more will have to buy this season. I think there should be a good trade in crated peaches to ship into these northern sections where there is not enough trade to warrant carload shipments. Thus far I have not tried selling for distant shipment, as it is more satisfactory to pick the ripe peach and deliver it at once. This season I want to try the experiment of picking some of the fruit while a little hard and shipping by express. It is worth trying at least to enlarge your trade territory. We are grouping most of our peach trees near the buildings. Over the hills, out of sight, many are stolen. The trees are headed so that inter-cropping may be practiced, and this pays with us. Between the younger trees we have potatoes, tomatoes or Lima beans. The bush Lima is a good crop for this purpose. We can plant three rows between two rows of peach trees, and by fertilizing well and giving good culture the trees are well tended and the beans give a good crop. Between the older trees we usually grow two rows of garden peas. This pays for the culture, and the pea vines are cut and piled around the trees shortly after July 4. Then the space between the trees is seeded to rye, buckwheat and clover. Later the trees bend down with their fruit, and the cover crop does not make much growth until Fall, when the rye and clover come on with a rush.

The apple crop will be a good one. It is still a mystery to me why we have the second heavy bloom in succession on our old trees. It was never before known on this farm. At one end of this orchard Jack has fenced off space for a dog kennel, where he handles dogs. Several of these dogs have run about here, so that the ground is entirely bare. I notice that the trees near these bare spots are loaded to the tips, while those back in the sod, while showing some bloom, are by no means as well covered. What causes this unusual blooming I cannot say. The large Baldwins, which gave us such a crop last year, are behaving themselves with great propriety, and according to the rules, for they have only a scattering bloom. The young trees in hill orchard have started a year earlier than I expected, and promise a great crop. The chances are that the apple crop throughout the country will be a big one, and that prices will be low except for superior and well-packed fruit. This is one of the seasons when the finest work at spraying, handling and packing will pay, for only fine specimens will bring high prices.

We got our potatoes in rather late, but in good shape. The potato field this year is at the back of the farm—a "loafer field," which a few years ago was in brush, White birch and cedars. These were grubbed out and the field was cut up with the disk plow. Then corn was planted, followed by a cover crop. Two years ago we planted apple trees, 20 feet apart, the fillers to be cut out later. Last year flint corn was planted, with rye and Crimson clover for a cover crop. The clover killed out, but the rye grew well and the grass came in thick. On May 18 we began plowing this field, with the rye about three feet high. A heavy chain tucked this rye under the furrow. First the plowman went around each row of trees, turning a furrow from each side to them. Then taking two alleys together, he went round and round. We found the grass sod very tough in some places, and this made us change our plans somewhat. After plowing the Cutaway came in, working first the way of the furrows and then across. This chopped up the soil without ripping out the green rye or grass. The Acme followed to cut up and smooth down the surface. If this field had been clean we should have used the planter and made a ridge up over the rows. Under the circumstances the reverse of this plan seemed best. So we scooped out furrows with the shovel plow, going in the direction of the plowing without ripping out too much rye The seed and fertilizer were dropped by hand in these furrows and covered lightly with the plow. The object was to get this seed down into the green rye, then to cover lightly, and then put on the fertilizer. Within a few days the cultivators will start working more and more of the soil into these furrows, and ripping up the grass and weeds between the rows. Later will come the weeder, but we plan to work that ground several times before the potatoes come up and thus keep the weeds down. This will be called rather rough and crude culture, but it seemed the best thing to do under our circumstances. Several inquirers have written asking about the Southern potato crop. Is it as large as usual? These men have old potatoes on hand, and do not know whether to sell at once or take the risk of holding for a rise. As a rule such a speculation is a pure gamble. Unlike wheat or corn, potatoes cannot be stored indefinitely or shipped in all weathers. It is not therefore a true case of demand and supply, and no one is ever sure of the crop unsold. From what I can learn, the South has as large a crop as usual, and shipments which would interfere with the old potatoes will soon begin. In my own case I should sell out the old stock at once at fair prices. I can see nothing in the present market to justify holding. H. W. C.

Study Your Wheat Before You Harvest It

If the stand and quality are bad you must do better. If they are good it will pay you to make them better. A better fertilizer will do it. The usual wheat fertilizers do not contain enough available

POTASH

See, too, whether your wheat is lodging. Potash stiffens the straw. If there's clover in the wheat, is the stand all you could wish? Many progressive farmers use Potash heavily on wheat followed by clover.

Study Your Wheat at Thrashing Time

If the ratio of grain to straw is too low, if the kernels are shrunken, your ground lacks Potash. Potash makes long heads well filled with plump, hardy grains.

Use a fertilizer with 6 to 8 per cent. available Potash, instead of 1 to 2, and balance the phosphoric acid of the bone or phosphate.

Tell your dealer now that you want such a fertilizer this fall. Write us today for our free book, "Fall Fertilizers." Ask us for prices on Potash Salts. We will sell you any amount from one 200-lb. bag up.

On a Bag of Cement Stands for a Record of 23 Years of Quality

When you buy lumber, you can see the quality; when you buy Portland Cement you rely on the maker and the dealer. ALPHA, the Guaranteed Portland Cement, looks like other cements, but its uniform high quality has made it the choice for concrete work wherever durability and permanence are required.

ALPHA THE GUARANTEED PORTLAND CEMENT

is warranted to more than meet U. S. Government tests. The Government has purchased hundreds of thousands of barrels of ALPHA for use in important forts, piers, sea walls, etc.

In building for all time you ought to have the best Portland Cement that is made. When you see ALPHA on a bag you can be sure that every ounce of the cement is thoroughly burned, finely ground, correctly aged—that every ounce is live and full of binding power.

ALPHA is tested hourly in the making, and is exceptional for fineness, uniformity and strength.

Your dealer can supply ALPHA if you insist. **Write for free 112-page book, showing how to make concrete improvements around the home and farm. Ask for BookR.**

Experience With Grimes Golden.

REFERRING to article on Grimes Golden, page 382, my experience has been similar; trees not only short-lived, but preferred by mice over all other kinds. I noticed in my first orchard 30 years ago, that Grimes took this bark disease close to ground and soon died, whereas Ben Davis, right alongside remained perfectly healthy and I find Gano, that better favored sister of Ben, fully as healthy. I never saw a Gano with any disease of bark, or injury from mice even when every Grimes in orchard succumbed to one or other in spite of my feeding strychnine to mice freely. The idea is not original with me, but I am now planting Gano seed to graft with Grimes 24 inches high. When should I do this and should I transplant Gano to orchard before grafting? A. R.

Owensboro, Ky.

The fault that Grimes apple trees has of being very subject to rotting at the collar is an old one. The idea advanced that the mice prefer the bark of this variety to that of others is new to me, but it may be true. As the best way to avoid the root or collar-rot is to top or double-graft the Grimes trees on Gano or some other healthy stock, the prevention of mouse injury would also be secured if it can be done in this way. To plant Gano seeds from which to grow seedlings for use as stocks for Grimes might be well or it might not be. The use of root-grafted Gano trees would be the safer plan. It is better to do the grafting or budding while the trees are yet in the nursery than after they are planted in orchard form.

H. E. VAN DEMAN.

Chinese Cabbage.

A CABBAGE with a flavor that makes it suitable for use in slaws was introduced from China several years ago by the U. S. Department of Agriculture, and the Department now announces that it has been successfully grown in this country and that samples of its seed will be distributed on request until the present supply is exhausted. This cabbage is called Pai Ts'ai, Brassica Pekinensis. Since its introduction here several years ago it has proved of unusual promise for late Summer planting, owing to its extremely rapid growth, in the Department's gardens. The Department now recommends it for more general use. The people in China plant this cabbage thinly. It is planted in rows and then the weak plants are pulled up, or else it is scattered over a space and then transplanted when of sufficient size. The plants must be manured heavily when about eight or 10 inches high—not sooner, or they will "burn," and not later or they will not mature before cold weather. The leaves should be tied up when they are pretty well grown, so that the long, loose leaves will not fall away from the center and become frostbitten, if extra-fine close heads are desired. The cabbages need a good deal of room. Therefore, the plants should be placed not less than two feet apart in rows that have at least three feet space between. Further information on how to cultivate this cabbage, as well as seeds for the same, may be obtained by writing the Office of Foreign Seed and Plant Introduction, U. S. Department of Agriculture, Washington, D. C. We have grown this cabbage for Summer use, and find it very crisp and tender, but with us it has suffered excessively from the attack of flea-beetles.

Destroying Chickweed.

Growing Cucumbers for Profit.

THE acreage devoted to cucumber growing for pickling purposes is increasing, particularly in Northeastern Ohio, in Michigan and Wisconsin. Many growers who produce tomatoes for canning and cucumbers for pickling station salting prefer the cucumber to the tomato crop, the returns and amount of labor considered. Growers and pickle men advise that cucumbers will do well on most soils except very heavy clay. The best soil is loamy, mixed with sand and clay. There is much of this soil on the lake shore in Ohio, Pennsylvania and other States, while there is suitable land throughout Michigan and in much of Wisconsin. The best manure to use is well-rotted horse manure, particularly on heavy clay soil, while on sandy soil hog or well-rotted cow manure should be used.

There are two ways of seeding, one in hills and the other in drills. In seeding in hills, after having fitted the ground as for corn, mark it off six by three feet. Where the marks cross, hollow out and put in a shovelful of well-rotted manure. Cover this manure with about three inches of soil, if the weather is dry, and if wet, two inches. Do not plant less than a dozen seeds in a hill, and when the plants are about four inches high, thin to about three or four to the hill. Leave only the most vigorous ones and they should be well distributed in the hill.

In seeding in drills, use a shovel or stubble plow, mark out the field in trenches about six or eight inches deep. The trenches should be about the same distance apart as the rows in hilling the crop. In driving between the trenches drop a forkful of manure in each trench at intervals of about two feet, and then distribute this with a fork or potato hook. Use from four to six loads to the acre, and cover with a two-horse corn cultivator by throwing the dirt in on the manure. Then follow the furrow with an ordinary garden seed drill, and set it so it will drop the seeds about two or three inches apart. When the plants are about four inches high, they should be thinned to about 10 inches apart, leaving only the most promising ones. Some growers have used a corn planter, mixing the seeds with an ordinary well balanced fertilizer, and drilling in this way. Cultivation with an ordinary two-horse corn cultivator is practiced.

Many growers secure good results from either method of planting, but many are particularly gratified in their results from drilling. Planting is advised between the 25th of May and June 1st, although cucumbers may be planted as late as the middle of June. If the ground is very dry, and you are planting in hills, many advise soaking seed overnight, using water at temperature of about 100 degrees. The pickle companies furnish seeds at 50 cents the pound, payable out of the crop, and these varieties are the very best for the purpose. It does not pay to economize in the use of seed nor the application of manure.

In Northwestern Pennsylvania the farmers growing pickles in Southwestern Erie county, declare $100 an acre is an ordinary return from the crop, while frequently an acre yields sufficiently above this amount to pay for harvesting that acre. The largest returns from an acre are from a Michigan grower, who received over $250 from an acre, it is reported. W. J.

"To what do you attribute your longevity?" asked the reporter. "My which?" quired the oldest inhabitant. "Your longevity," repeated the reporter. "As far as I can remember, I ain't never had no such complaint."—Vancouver Saturday Sunset.

Growing wood doesn't rot Cut wood need not

Sap is the life of growing wood. The moment wood is cut the natural sap dries out of it and leaves the pores open. After that the less moisture in the wood the better. Paint made from

Dutch Boy White Lead

and Dutch Boy linseed oil protects weather boards by excluding moisture.

Try an experiment. Add to a paste of White Lead and Water some Linseed Oil. Watch the oil literally push the water out. Dutch Boy made-to-order paint resists water just as effectively and is so fine that it anchors into the empty wood pores and sticks there like a driven nail. It wears slowly, beautifies for years, needs no burning off to repaint. Dutch Boy paint may be tinted any color. Your dealer can mix it—or you can.

You can now get red lead in paste form, same as white lead. Doesn't harden in the can. Fine for painting resinous wood; best by all odds for implements and metal work. Ask your dealer.

A Text Book on House Painting FREE

Ask for Farmers' Paint Helps No. 2510

Tells how to mix all colors for paint uses; how to estimate cost and quantity of paint required; how to test paint for purity.

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates 60 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

TEN WEEKS FOR 10 CENTS.

IN order to maintain the improvement and enlargements that we are now planning for THE R. N.-Y., we should have a circulation of 200,000 copies weekly. We must depend on our old friends for this increase. To make it easy for these friends to introduce the paper to other farmers who do not now take it we will send it 10 weeks for 10 cents for strictly introductory purposes. We will appreciate the interest of friends who help make up the needed increase of subscriptions.

*

THE Department of Agriculture states that the cost of producing a bushel of wheat in Saskatchewan, Canada, is 55 cents, or 62 cents to put that wheat on board the cars at country points. This cost has increased, while the selling price of wheat has fallen from 81.2 cents to 66.125 cents per bushel. This leaves a wheat farmer a margin of 4.125 cents a bushel. How much of the consumer's dollar does this Canadian wheat grower receive, and how much of the product made by that consumer can he buy with his 4.125 cents?

*

IN the last Woman and Home magazine, page 770, was the story of Mr. and Mrs. Canfield, who do custom canning for the neighbors. They put vegetables, fruits and meat into cans. Now this meat canning may open a way for a direct trade between farmers and consumers. At present the farmer with one or two beef animals to sell has no satisfactory market. The local butcher will not pay a fair price, and it will not pay to ship unless a reasonable number of animals can be sent. Therefore the single beef animal is usually sold at a loss or at no profit. If this meat can be put into good-sized cans in a cleanly way it can be handled to better advantage. There would be a demand for it in the city, and after some experimenting farmers would know just how to prepare it for the trade. Here is a chance to use the cans to obtain more of the consumer's dollar.

*

A READER at Hastings, Nebraska, sends us the local prices paid farmers for farm produce. Hogs bring $7.75, steers $6, cows $5 per cwt., and hens 12 cents per pound. Yet our friend says:

I will say that if anyone has enough money to spare to buy beefsteak or pork, either will cost 25 cents per pound, with only one profit added to the purchase price of seven and 7¾ cents for the raw material after it is cut up. As for me and my house, we go without meat except on company days, and find that we are better off, not only financially but physically.

This we figure to be 28 cents of the consumer's dollar to the farmer—with only one handler between. If we are wrong in this will some "two blades of grass" mathematician set us right? By the time that beef got to the Atlantic coast it would be worth 53 cents or more. This man should extend his meatless meals to the "company." They would be better off also. When we stated two weeks ago that the policy of the beef trust is driving the people to vegetarianism we did not suppose it would start out West—in the beef country.

*

NO doubt some one will come criticising the remarks about city and student labor on page 792. It is their privilege to do so, but so far as we can learn these notes express the opinion of most practical farmers on this subject. During our short Northern Summers time is precious—or ought to be—and every farmer knows that unskilled or playful "helpers" are only in his way. There are among these students and city men some who give good service and earn good wages. As a rule such men have little trouble in finding a job. On the other hand there are ball players and sports who imagine they can bluff some of these farmers and draw good wages while having a pleasant little outing. They make a big mistake in this, and our advice to the patronizing and conceited young man is to keep away from a successful fruit farm, for we can promise him that his conceit will be quickly dissolved in sweat. On the other hand, it might be possible for many of those young fellows, if they wanted to, to "brace up" and learn how to be mighty helpful.

*

THE SHEEP AND THE WATCHDOGS.

"The stockholders in times of prosperity are like sheep—they go on and browse. When there's trouble they all make for the same hole in the fence and injure themselves."

THAT remark is credited to Charles H. Mellen, formerly president of New York, New Haven and Hartford Railroad. Mr. Mellen was testifying before an investigating committee at Washington about the mismanagement of his railroad. Whatever we may say about Mr. Mellen as a railroad wrecker we must all admit that he exposed one great truth and one great weakness of human nature in the above statement. Not a man who reads this can, if he be honest, deny that this applies more or less directly to some of his own behavior.

All men are in a way stockholders. They may buy stock in some business enterprise—either co-operative or some form of a trust or monopoly. That of course is what Mr. Mellen meant, but in a larger way we are all stockholders in the great business of society. That is the very foundation theory of a republic—the fact that every man has some little voice in government and some definite interest in the way that government is administered. All are shareholders in the Nation, or else we no longer live in a republic. Some men may have a larger share than others—due to property rights, intelligence or responsibility, but all are shareholders in some degree. Now as the simplest illustration take a coöperative society, a building and loan association, or a small manufacturing company. Ask yourself if Mr. Mellen is right. We know dozens of such organizations where most of the members "go on and browse." A few men conduct the organization, but the average stockholder pays little attention and asks no questions so long as his dividends come regularly. When for some reason the business goes wrong these stockholders fall into a panic, and not knowing the real cause or history of it probably do just the wrong thing, and ruin the enterprise. There was a fire in a girls' school. There had been no fire drills—no discussion of what to do in an emergency. All that had been left to the teachers. The result was a wild rush for the stairs and a dozen were trampled to death. Fire broke out in a girls' college at midnight. There had been weekly fire drills and each girl had studied the situation. As a result 500 students gathered and marched out of the building singing their college songs. In one case the students had been left to browse—in the other they mastered the situation. If the smaller shareholders of the New Haven road could have received a drill corresponding to that of the college girls, J. P. Morgan would not have dared to play checkers with a great corporation, and Mr. Mellen would not now be telling about it.

Or, take the larger view of a shareholder's duty. From the election of school trustee up to the selection of a President, you and all the rest of us, have been acting more or less like sheep, rather than watchdogs. We may work hard to elect a man or a set of men—then we "go on and browse," leaving these men unwatched to do almost as they please. If a man is of our own party we justify most that he does for political reason. If he belongs to the other party we criticise him and try to tear him down, even though he honestly tries to do what we know in our heart to be right. Now and then good men of all parties unite to put some strong and true man in office. He faces public evils which are rooted in politics because they have been growing for 20 years. No man, however strong and honest, can reform these things in his short term of a few years, yet because he does not do the impossible at once we listen to the politicians and tear this man out of office as soon as we have a chance.

Tell us now if this is an honest indictment. Have we not stated in this the weakness of human nature as applied to public matters? We might go further, and say that many men like to be watchdogs provided they can watch some one else and not themselves. Such men will tell you how to conduct the Mexican war, yet permit the school in their own district to become a failure through lack of supervision. The great problem in American public life today is how to turn the sheep into faithful and fighting watchdogs. The people understand this, as is shown by the demand for primary nominations and the recall of unfaithful officials. All the laws on earth, however, will never give us what we need until plain, common men like ourselves stop being sheep and play the higher intelligent part of watchdogs—ready to give up something of our own comfort if need be for public service. There is too much truth in Mellen's remark. It is for us to change it. The great reformer is made possible by the thousands of honest men who back him at every turn. His strength comes from their watchfulness. The great rascal is made possible by the thousands of good men who let him alone to do as he pleases. His strength comes from their indifference.

*

WE like the tone of that letter from Tom Barron which is printed on the next page. There is a bluff, hearty courage and conviction in the following:

Personally, I do not care a hang if I do not sell a bird to an American breeder, for I do not wish to undo anything that the American may have done as regards putting up a standard type. My point is that type is but a small consideration, seeing that I absolutely breed with the idea of getting the highest layer.

Thus far the people who claim that these birds are cross-bred or not pure Wyandottes have absolutely failed to produce evidence that would carry conviction. They have the chance to do so, for our columns are open to them. All we want to do is to learn for the benefit of our readers how to find the most economical hen. By that we mean the hen which will give us most eggs for a dollar. We will be one of five, 10, 20 or any number to raise a fund for the purpose of having every bird in the egg-laying contests accurately scored by the "standard." Then let us compare their "scores" with their records. Or, we will contribute to a fund to buy a pen of the highest scoring White Wyandottes that can be found and enter them in the next contest!

*

A REPRESENTATIVE of the Jewish Agricultural Society has just sent us the following letter:

The first Farmers' Savings and Loan Association was organized and over $60,000 worth of shares were subscribed at Centreville, N. Y., last week. Arrangements were made to apply for a charter. I shall endeavor within a few days to send you a more complete statement of the proceedings. I take this opportunity to express to you on behalf of the farmers present at the meeting a unanimous vote of thanks for your co-operation in arranging this meeting, and in general for the interest you have shown in the Land Bank.

New York. J. W. P.

This is the first exclusively farm savings and loan association to be formed to utilize the benefits of the Land Bank. The Jewish farmer and the altruistic friends of the Jewish farmer know a good thing when they see it. They have traditions of trade and finance behind them of many centuries. They are the first farmers of the State to organize to be ready to profit by the Land Bank the day it is opened for business. Other sections, however, are getting ready and some others may have advanced thus far; but this is the first one to report. We ought to have a fair representation of farm associations as charter members of the bank. How about your section?

BREVITIES.

IF you would catch a farmer off his guard—go unawares and visit his backyard.

WHAT'S the use of a college education unless it can give a boy or girl moral and business advantage?

NOW we have a corn cob-rot discovered in Kansas. This disease spreads in storage.

THE "Bang" system of handling tuberculous cows does not mean banging them with the milking stool or the boot, but separating them from the rest of the herd.

IN Saskatoon, Western Canada, any citizen can, by paying one dollar, obtain a vacant lot to be used as a garden. The city plows and disks the ground for him.

THE fur business has got down to the point where the skins of moles have value. More than 3,000,000 moleskins were sold in England during the past three years.

IN the old days, when corn required at least 130 days to develop, we had to plant by May 20. Now with real 90-day corn we can let the cover crops grow large and wait until June 15 if we have it.

THOSE kind-hearted friends who told us that thousands of song birds are annually killed by spraying orchards. Where is their evidence? We have given them every chance to prove their statement, but proof is not forthcoming.

THE so-called tobacco wireworm does great damage to the tobacco crop and also injures corn. One suggested remedy is growing cow peas or Crimson clover one year before tobacco or corn are planted. That's good advice whether there are worms or not.

WE have a number of questions about prices to charge for custom spraying. In our own case we charge one dollar per hour for the work of a power sprayer, two horses and two men. When we furnish spraying materials we figure a profit of 20 per cent. on materials.

LAND BANK OF THE STATE OF NEW YORK

System of Mortgage Credits Explained.

PART VI.

AVOID EASY CREDIT.—An easier method of securing money on mortgage could be provided, but this system was not devised to invite the largest possible risk in order to secure the corresponding greatest possible profit to the lender. It was devised to enable an owner to sell a safe and conservative credit at the lowest possible interest rate, and on the easiest possible terms of repayment. It was not the purpose of this particular plan to make it too easy to go into a heavy mortgage debt. Every virtue may be cultivated until it becomes a sin. Instead of a blessing a mortgage may become a curse. Since the dawn of history one set of men through cunning and device have sought to profit by other men's labor. They have never found a means more subtle or more suited to their purpose than the instruments of credit. Away back where Roman history begins to escape from the mists of allegory and fable we find the astute money-lender alluring the less crafty tiller of the soil into debt. We read that the Roman law gave the creditor possession not only of the debtor himself but also of the debtor's family. The debtor may be cast into prison; but this extreme privilege was seldom resorted to, for the reason that the prisoner working in the fields to reduce his indebtedness was a better asset to his owner than a man in jail. Within writer's memory, the company store in New York State encouraged the factory operatives to exceed their wages in store credit so as to control their trade and their liberties better. Today in the Southern States the factor controls the cotton planters through advances on loans. His purpose is to keep the planters always a little in debt. If by any chance the crop is sufficient to clear up the advance loan, then the ingenuity of the factor is exercised to sell the planter some article of luxury, such as a horse or a buggy, in order to keep him in debt and in the power of the factor. So instead of making loans too tempting, this system was surrounded with safeguards to make it save and protect the borrower by putting the control into his own hands. Mortgage banks to be controlled by bankers and capitalists have been proposed to finance farm mortgages. We bid farmers to have a warning of them. If organized at all, such banks will exist for the purpose of making dividends. Provisions simple enough will appear in the mortgage, but later on they may have a serious meaning. The expense of conducting such an institution would be burdensome, and the owner would pay the expense. What may be altruistic at this time may turn out to be a "pound of flesh" to the next generation.

Other systems than the one here mentioned may, of course, be successful; and in some situations may be needed. Some earnest and sincere advocates of farm credits favor a duplicate system, and this may yet come. There is room for another system, but the plan would need to be developed with care. It would be an easy matter under the allurements of good profits to accumulate money on stocks and bonds of a mortgage bank to loan on farm mortgages involving unusual risks and high rates of interest and expensive disbursements. But there would be a day of reckoning, as there has been with some institutions in the past. A brief period of easy money would encourage speculation and risk. Losses and demoralization would be the inevitable result of an expensive and wasteful system. To avoid this some plan of local supervision and responsibility must be provided in any system adopted. Coöperative credits should, however, furnish all the cash the individual credit will warrant on a safe basis. The rules of the savings and loan associations are elastic and comprehensive. They permit considerable latitude in individual requirements; and it is believed that any case of safe requirements can be accommodated under them. People of small means will be invited to invest their money in the bonds of the Land Bank, and safety was necessarily the first consideration in making a law for its organization. If the law has any fault it is on the side of safety. Later on it may be that experience will justify removing some of the restrictions that safety seems on the start to demand. No man unworthy of credit should hope to get it through this system. It is believed that every man will be able to get the portion of credit to which he is entitled. The system is new and needs to be worked out and developed. The first step is local organization and the sooner this is effected, the sooner the benefits and conveniences will materialize.

SAVINGS AND LOAN LOCATIONS.—The following shows the location of savings and loan associations in the State by counties and post offices. The figures following the post office indicate the number of associations in that city or town. For example there are four associations in Binghamton, Broome County:

Albany—Albany, 15.
Alleghany—Alfred.
Broome—Binghamton 4, Deposit, Gowanda.
Cattaraugus—Olean, Salamanca.
Chautauqua—Jamestown 5, Dunkirk 2, Silver Creek.
Chemung—Elmira 5.
Chenango—Norwich, Oxford.
Columbia—Hudson 2, Stuyvesant Falls.
Cortland—Marathon, Cortland.
Delaware—Walton.
Dutchess—Poughkeepsie.
Erie—Buffalo 248, Springville, Tonawanda 3, West Seneca, Lancaster, Hamburg, East Aurora, Depew.
Franklin—Saranac Lake.
Fulton—Gloversville 3.
Genesee—Batavia 2.
Greene—Catskill 2.
Herkimer—Dolgeville, Frankfort, Herkimer, Ilion.
Jefferson—Carthage, Clayton, Watertown 2.
Kings—Brooklyn 49.
Lewis—Lowville.
Livingston—Dansville.
Madison—Canastota, Oneida.
Monroe—Rochester 81, Brighton, Brockport, East Rochester, Fairport, Gates, Irondequoit.
Nassau—Hempstead, Port Washington, Rockville Centre.
New York—New York 172.
Niagara—North Tonawanda, Lockport, Nigara Falls, Suspension Bridge.
Oneida—Utica 3, Whitesboro, Rome, Oriskany Falls.
Onondaga—Syracuse 19.
Ontario—Geneva 2.
Orange—Newburgh, Port Jervis 9, Goshen, Middletown 3, Central Valley 2, Monroe.
Orleans—Medina, Albion.
Oswego—Oswego 12.
Otsego—Oneonta.
Queens—Long Island City 3, Woodhaven, Flushing, Jamaica, Whitestone.
Rensselaer—Castleton, Hoosick Falls 2, Troy 4.
Richmond—Stapleton, Mariner's Harbor 2, New Brighton, Port Richmond 2, West New Brighton 3, Tottenville, Tompkinsville.
Rockland—Spring Valley 3, Nyack, Pearl River, Haverstraw, Suffern.
St. Lawrence—Canton, Gouverneur, Norwood, Ogdensburg, Potsdam.
Saratoga—Mechanicsville.
Schenectady—Schenectady 2.
Seneca—Seneca Falls.
Steuben—Avoca, Bath, Cohocton, Corning, Hornell 2, North Cohocton, Wallace, Wayland.
Suffolk—Amityville, Babylon, Sayville.
Tioga—Waverly 2.
Tompkins—Freeville.
Ulster—Rondout 2, Kingston, Saugerties.
Warren—Glens Falls.
Washington—Whitehall.
Wayne—Lyons, Palmyra.
Westchester—Yonkers 2, White Plains 2, Hastings-on-Hudson, Mount Vernon, Mamaroneck, New Rochelle, Peekskill, Tarrytown, Tuckahoe, Williamsbridge.
Wyoming—Attica.
Yates—Penn Yan.

Farmers living in the vicinity of any of these places may very readily find the officers of any of these savings and loan associations. It would be well for a number of farmers to send one or more delegates to confer with the town association with a view of farmers becoming members of the existing association. To accommodate the farmers it would be necessary for the existing association to become a member of the Land Bank, and to change its charter and by-laws so that dues could be paid quarterly or semi-annually, or possibly annually in some localities. The prospect of a large increase in membership of substantial farmers will encourage any association to give their requirements proper consideration. Societies which have made the change in their rules to meet farm conditions have found that the new rules worked most satisfactorily, and it is probable that any association would be glad to adopt rules within the law, and in accordance with successful practice elsewhere to attract and accommodate the new members. If for any reason the existing association does not wish to change the rules and the farmers find the monthly payments impractical, they may form a new association for themselves. J. J. D.

A LETTER FROM TOM BARRON.

Those Wyandottes and Leghorn Hens.

[We are at liberty to print the following extracts from a personal letter received from Mr. Barron, the English poultry breeder. After what has been said regarding the type of the English Wyandottes it is only fair to let Mr. Barron make this plain and candid statement.]

"UTILITY BIRDS."—Evidently the great point at issue in your country is the same as in mine. That is, the exhibition men are trying to set up anything that will mislead people, in respect to the utility poultry keeping and go so far as to say that the fowls are "crossed," "little weedy birds," etc. But the point really is that these men have lost in this country a tremendous amount of business, through the utility men teaching the working people that the bird that would lay was the bird for them, and not the exhibition bird, because the latter was only to look at. The utility men have provided the bird that will benefit them. Apparently the same thing applies to the exhibition men of your country, and they are now beginning to say that our birds are not purebred, because they may lay a tinted egg, or the birds may not be as good a type as the exhibition bird, or may be a different type.

THEY SCORE LOW.—My birds may possibly score very low in your exhibition pens in Ameriea, and may do the same in this country. In fact I do not think they would get a "highly commended" card. But the point is that we have never bred for exhibition purposes, nor admitted doing so, but have bred hens specially to lay eggs, and have tried to make this quite clear. By using the trap-nest it has brought out a different type of bird altogether, to what was started with. For instanee, we find from long use of it, the smallest bird lays the most eggs, and the longest-backed bird makes the heaviest layer. Now this is absolutely against the show type of English and American birds. The utility White Wyandottes weigh four to five pounds, while the exhibition bird of this same breed will scale 8½ pounds—that is the female—and the cockerel weighs 9½ pounds. The reason that my birds are tinted in lobe is that the trap-nest seems to have brought out this defect—if utility people can call it a defect—in addition to the long back mentioned. But we cannot help it if the trap-nest does produce the bird with these, in bringing out the layer. The birds must necessarily breed their type in producing the high record bird.

NEVER WAS "CROSSED."—Personally, I do not care a hang if I do not sell a bird to an American breeder, for I do not wish to undo anything that the American may have done as regards putting up a standard type. My point is that type is but a small consideration, seeing that I absolutely breed with the idea of getting the highest layer. In the matter of my birds being "off color" in the leg the same thing holds good. It is the effect brought about in getting the heaviest layer by the trap-nest, the best layers being the worst in this respect, and in some cases are absolutely pure white in the leg. Now, my White Wyandottes have never had a cross put into them since I have had them, this last 15 years, and the same is precisely the case with the White Leghorns. The trap-nest is therefore entirely responsible for this change in type, etc.

THEY NEED NOT BUY.—I am positive that even if I did not sell a stock bird, or any eggs for hatching purposes, I could still get a living out of my poultry, and that without any fear of the world denouncing me as a fraud. I am certain that from my utility poultry, being bred specially for laying, I could make three dollars per bird per year for egg production alone. But mind you, if America—or England if it came to that—did put me down as a fraud, I would see to it that I did not sell any more stock, so that they could not take away my good name. All the same, I am very sorry that some of my friends in your country should have attempted to denounce my birds as hybrids. There are always people who will willingly or otherwise believe adverse reports on any matter whatever, but I have always tried to show your people that it is layers that I do breed. TOM BARRON.
England.

New York State News.

CHEESE MAKERS CONVENE.—A cheese makers' conference was held May 26 to 28 at Hogue's Lower Five Mills cheese factory at Allegany and on the two following days at Varysburg cheese factory. The cheese instructors of the State demonstrated the latest and most improved methods on scientific cheese making.

SUPERINTENDENTS OF HIGHWAYS.—On June 25th and 26th the annual meeting of county superintendents of highways of the State will be held at Ithaca, when over 300 are expected to be in attendance. State Superintendent Carlisle and Senator Murtaugh are to deliver addresses. Some of the innovations which have been worked out on the roads of the county will be pointed out on a trip over the roads under direction of the special route committee.

OTSEGO POTATO CONTEST.—The district superintendents of Otsego County, in conjunction with the Farm Bureau, will conduct a series of potato growing contests among the pupils of the rural districts in the county and prizes will be awarded to the winners, a Holstein bull calf being first premium. The contest will be conducted after the "tuber unit method." Each contestant will plant 25 potatoes of a purebred variety and each tuber will be cut into four pieces, one piece to the hill. By a unit is meant the four pieces of each potato. Except the plowing, all the work must be done by the contestant.

CONVICTS ON ROADS.—State Superintendent of Prisons Riley is credited with the statement that 250 miles of convict-built dirt roads will be constructed this year in this State. He was granted $50,000 by the Legislature to test convicts as road makers. Instead of making macadam roads he will make a much longer mileage of dirt roads. Officials in Warren, Washington, Saratoga and Essex Counties have applied for convict help.

COLD STORAGE VIOLATIONS.—Since January 1 there have been 39 prosecutions for violation of the cold storage law. There have been 13 convictions, 11 dismissed by consent, five held for Special Sessions and 10 not returned.

LEADERS WANTED.—A personal note from Prof. Lauman says, respecting the School for Leadership in Country Life to be held at Ithaca June 23 to July 3, "We have sent an announcement of the school to every Subordinate Grange in the State, hoping that wherever there is a real leader who may be persuaded to come to us, we may get in touch with him." Community leaders or those who would like to be, will surely gain much by attendance on this brief session in the interest of rural life. J. W. D.

The Continuous Wheat Harvest.

WITH the exception of one month (January) wheat is being sown in some part of the world, and there is a wheat harvest somewhere every month but October, according to the International Institute of Agriculture.

Starting with January, Argentina and neighboring South American countries, New Zealand and Australia are finishing their Winter wheat harvest, the principal part of the work having been done in December. Winter wheat cutting starts in British India in February and lasts three months. March and April complete the Egyptian harvest.

In May, the United States, China, Japan, Spain and Portugal start with Winter wheat, and the first Spring wheat in the United States is harvested.

June marks the beginning of harvest in many countries of South Central Europe. Germany and Northern Europe begin in July. Great Britain and Canada's heaviest cuttings are in August and September, and in the latter month Denmark, the Netherlands, Russia and Switzerland close.

In a normal season practically no wheat is cut in October. November starts the first cuttings in Argentina and Ethiopia, and closes the last of Great Britain's wheat harvest.

Crop Notes.

THE Government report shows that in the Winter wheat and chief corn-growing States the weather is favorable though rain is needed in the Ohio Valley. In the western part of the corn belt, planting has been completed under good conditions. Pastures and oats are prospering in the northern sections, but suffering from drought in the south. Weather in the Spring wheat belt is favorable. Oklahoma and parts of Texas have suffered from continued rains, hindering planting and cultivation. The Atlantic States need rain badly.

B. W. Snow says, "There is a marked deficiency in rainfall for the present season over the greater part of the corn and oats territory. It has been particularly dry through central and southern Illinois, Missouri, eastern Kansas, Nebraska and Iowa, and a period of hot weather before rain is received will bring wide complaints from corn and oat fields."

Woman and the Home

From Day to Day

Humbler Heroes.

It might not be so difficult to lead the light brigade.
While the army cheered behind you, and the fifes and bugles played;
It might be rather easy with the war-shriek in your ears
To forget the bite of bullets and the taste of blood and tears.
But to be a scrubwoman, with four Babies, or more,
Every day, every day setting your back On the rack,
And all your reward forever not quite A full bite
Of bread for your babies. Say! In the heat of the day
You might be a hero to head a brigade,
But a hero like her? I'm afraid! I'm afraid!

—Edmund Vance Cooke in Saturday Evening Post.

*

IN washing very heavy dirty garments, such as men's overalls, if a washing machine is not used the hands may be saved in the rubbing by using a scrubbing brush. The garment is laid on the board, and there scrubbed, with plenty of soap. Sooty oven cloths may be cleansed by soaking over night in just enough kerosene to cover and then washing with cold water and abundant soap.

*

AT a recent meeting of a medical society in this city operations for adenoids came up for discussion, and the opinion was strongly expressed that nasal breathing was the best preventive of adenoids. In other words, teach a child from babyhood to keep his mouth closed, and to breathe through his nose, and this trouble is not likely to appear.

*

WHERE a delicate narrow lace is desired for fine underwear or infants' clothes, Armenian edging may be recommended. It costs from three cents a yard up, and looks like a "real" lace, with its fine thread and spider-web pattern. This narrow Armenian lace is just right for finishing hand-embroidered garments, or little nainsook slips for the new baby.

*

FOR a specially dainty sandwich, use Boston brown bread, cut very thin. Spread with a mixture made of half a pint of cream, whipped very stiff, half a cupful of dates, stoned and chopped, half a cupful of nut meats, chopped fine, and a little powdered sugar, all stirred well together. Spread the filling smooth, and put the sandwiches together neatly, cutting into fancy shapes if desired.

*

A RECENT reference to the use of a mangle, as a labor-saving laundry device, has called out questions as to price, etc. A good mangle, household size, is sold by a New York department store for $5.74; it has hardwood rollers, and is clamped to any table, like a wringer. Of course turning a mangle is not a sedentary occupation, as Mr. Mantalini discovered, but it saves ironing of all flat pieces, and will take one away from the stove in hot weather.

*

JAVELLE water, which is a useful bleach for removing stains, is made by dissolving one pound of sal-soda and one-quarter pound of chloride of lime in two quarts of boiling water. When these substances have dissolved as far as possible, and the solution has settled, pour off the clear part and bottle—and be sure to label the bottle properly. The dregs may be used to flush waste pipes, or to scour unpainted woodwork. When the undiluted Javelle water is used to remove stains on tablecloths, or similar white materials, the article is spread out flat, and the spot scrubbed with a brush dipped in the Javelle water; after this the fabric is rinsed in water containing a little ammonia to counteract the corrosive effect of the bleach. It should be remembered that the bleach has a powerful action on the hands. A small quantity of this bleach in the rinsing water will whiten yellow fabrics, or those that have become dingy through bad water or careless methods. Many professional laundresses use entirely too much of the bleach to save rubbing, and thus destroy the fabrics.

Seen in New York Shops.

AMONG simple but smart blouses for warm weather wear are many with low neck and elbow or three-quarter sleeves of the raglan shape. Favorite materials are voile, either plain or embroidered, fine crape and marquisette, with collar and cuffs of organdie. One of these waists with elbow sleeves had odd flaring bell-shaped cuffs of organdie. This organdie may be bought in a quality that launders well.

One of the large shops is exhibiting new styles in women's wear named after "The Salamander," a new, and to our mind rather disagreeable American novel, soon to make its appearance as a drama. The "Salamander" gowns have a Russian blouse effect with long straight tunic and a little touch of red in trimming or necktie. Little buckled shoes, silk stockings with contrasting clocks, underwear, hats and hand bags all appear in these "Salamander" styles, which are rather simple and girlish in effect.

Some combinations of brown and white are offered as a new French idea, and they are very becoming for Summer wear. A very handsome gown of embroidered white voile had a little sleeveless jacket of brown satin; it buttoned to the waist in front, and had sash ends in the back. Brown hat, slippers and parasol with a fine white dress will be found very effective. A white duvetyn dress made with a long redingote was trimmed with brown soutache braid. The very dark brown known as tete-de-negre, as well as golden and bronze shades, are used in this way. Bronze kid is much used for Summer slippers and pumps. The combination of brown and white is fashionable for children, too, and is more becoming to a child who tans very readily than brighter colors.

Taffeta is so enormously popular now that it is not surprising to learn that the Paris dressmakers are preparing to discard it for satin. However, it will no doubt hold its popularity here for some time, and we see some handsome jacket suits of this material that are very suitable for Summer. Women of conservative taste will find the new long Cossack tunic very suitable for taffeta; some of them are edged with a half-inch knife pleating, the same trimming being used to edge the short coat. Little kimono coats, loosely fitting, may be worn over a separate waist of lace, maline or chiffon, or one of these materials made up with just enough taffeta to form when attached to the skirt, a one-piece dress. A waist of maline or tulle is not quite as perishable as it sounds, since it is really more like a draping of tulle over a lace, net or chiffon foundation. Still, it is no fabric for a frugal buyer, though used abroad for flounced and draped skirts, as well as bodices.

It is not easy to dress a girl of 12, because she is often too big for little girls' styles, and too young to copy her elder sisters. A nice model for this age seen in a high-class shop was made of tan-colored crash. The waist was a plain Norfolk coat with smart little patch pockets and a belt of the same material, while the plain skirt had a box pleat both back and front. The blouse had pearl buttons and white linen collar and cuffs. This very practical model is suitable for any color in linen, galatea, etc.

A good many children's suits are made this season on "Oliver Twist" models. These are modeled after the quaint styles illustrated in early editions of Dickens, the principle feature being the skirt, or trousers, buttoning on to a plain, rather short-waisted blouse. In the boys' suits the trousers are plain and straight, made of colored chambray, galatea, or linen, the blouse white, with round Dutch collar and cuffs of the colored material. The girls' dresses have plain little four-gored skirts of colored material, and like the boys' suits, they have colored collars and cuffs on the plain blouse. In both cases there are many buttons fastening the short waist to its continuation, and a double row of buttons on the front of the blouse, which, to the Dickens student, recalls not only poor little Oliver, but also the ghost of Master B., in the "Haunted House," who was clad in an obsolete suit, much too tight, with a double row of gleaming buttons.

Rose Beads Again.

PLEASE publish through "Woman and the Home" column, how to make rose beads out of dried rose petals.

F. E. M.

These beads are not usually made from dried rose petals, but from fresh ones. The following directions given by an Oregon correspondent are reprinted from our issue of June 14, 1913:

Gather the petals when free from moisture, say a 10-pound pail packed full, put them through the food-grinder at least six times. Hunt up an old rusty kettle or pail, the rustier the better, rub it vigorously so there will be no loose pieces of rust, then plaster the rose pulp over the bottom and sides, about one-half inch in thickness, cover and set away in a cool place for two days, when you will find that the rust is turning the pulp black. Put it through the food-grinder again at least four times and plaster it over the kettle again and let stand as before. Put through the grinder again three or four times, the more the better, and if it is a good jet black it has had enough of the rust treatment and is ready to be formed into beads, provided it is of the right consistency. Roll a small piece of the pulp in the palm of the hand; if it makes a good firm ball it is all right; if it cracks it is too dry and should be sprinkled and rolled in a wet cloth for a few hours, and if it is too soft to keep its shape well, the pulp should be spread out to dry a little. To get the beads the same size press the pulp through small funnel; this will form bars of the pulp, which may be cut into pieces of equal length. Roll the pieces in the hand as children make mud marbles, and shape with the fingers. Put a pin straight through each one as you finish it and stick the pin upright in a cushion or mat, until the beads dry, when the pins may be slipped out and the beads are finished. String on a dark thread with about eight seed beads between the rose beads. The daintiest effect is produced by stringing as follows: one rose bead, two steel beads, four jet black beads, two steel beads, repeat. Gold or any preferred color of seed beads may be used in place of the steel beads. Keep in a covered box when not wearing them and their fragrance will last indefinitely.

Some suggestions: A drop or two of olive oil mixed into the pulp before it is put through the grinder the last time will give the beads a glossier black. The smaller beads are much daintier, make them so they will be about the size of allspice berries after they are dry. They shrink about one-half. Make some very small ones and combine with seed beads to make some of the beautiful necklaces worn so much. If the grinder and other utensils used when grinding the pulp are washed at once, first with cold water, they will not be stained. A little oil rubbed into the hands, olive oil is good, and then some lemon juice, will remove the stain from fingers.

Stamped on fine quality nainsook 90 cents; one-half dozen skeins of floss to work 10 cents.

Books are not made for furniture, but there is nothing else that so beautifully furnishes a house. * * * Give us a house furnished with books rather than furniture.—Henry Ward Beecher.

Salt Cucumber Pickles.

Would you give me the recipe for old fashioned salt cucumber pickles?

MRS. W. A. S.

The following recipe is for storing the cucumbers in barrels, but they may be put in large crocks in the same way: Choose small cucumbers free from spots. Put a layer of cucumbers in the bottom of a cask, then a layer of coarse salt, about one-fourth inch thick, then another layer of cucumbers, more salt, and so on until all are used. Place a board on top of the pickles, with a heavy stone to keep them down. Then pour in about a quart of water to moisten the salt, which, with the juice exuding from the cucumbers should make sufficient brine to cover. Continue to add cucumbers, as they are gathered, in layers as before; a few cabbage or horseradish leaves on top, under the board, will prevent molding. When the cask is full, tuck a cloth closely around the edges, put board and weight on top, and cover closely, and the cucumbers will keep for a year or two. When cucumbers are wanted for pickling, remove cloth, board and stone, and wash them well in warm water; wipe all scum from sides of cask with a clean cloth, take out cucumbers, and then cover any remaining as before. Soak cucumbers for three days in cold water, changing water each day; drain and wipe carefully. Half fill a large porcelain-lined preserving kettle with good cider vinegar, put in as many cucumbers as the vinegar will cover, with a piece of alum the size of a hazelnut; heat to boiling point, stirring with a wooden spoon so that they do not soften at bottom of kettle, and then drain, throwing away the vinegar. Cover with fresh cold vinegar, spice if desired. A little chopped horseradish at top will prevent molding.

Cooking Eggplant.

Could you give some recipes for cooking eggplant? W. W. H.

A favorite method for cooking eggplant is frying; it is also broiled, stewed, scalloped and stuffed. For frying, peel and cut egg-plant into slices one-fourth inch thick (it may be thicker if liked) lay in a bowl of cold salted water, and leave one hour with a plate on top to keep it under the water. Remove from water and wipe dry. Then dip in fritter batter, or in egg and cracker crumbs, and fry in deep fat. If egg and crumbs are used dip the slices and then put in the icebox for an hour before frying.

To broil, slice, soak and wipe the eggplant as for frying. After drying lay the slices for 15 minutes in a marinade made by stirring together five tablespoonfuls of olive oil with two teaspoonfuls of vinegar. At the end of 15 minutes remove the eggplant, drain in a colander, sprinkle with pepper and salt, and broil on a gridiron over a clear fire. Cook for five minutes on one side before turning the broiler; serve very hot.

For scalloped eggplant, peel, cut into dice, and soak in cold salt water for an hour. Then parboil 20 minutes, drain, and put in layers, in a baking dish, alternately with crumbs. Dot each layer with butter, pepper and salt, and strew with minced green pepper if you have it. When the dish is filled, cover with a layer of crumbs moistened with cream; dot with butter, cover, and bake half an hour; then remove cover and brown. It may also be scalloped with alternate layers of chopped ripe tomatoes.

For stuffed eggplant wash and wipe a large fruit, then boil for 10 or 15 minutes. Drain and let it get perfectly cold, then cut in half lengthwise, and scrape out the center, leaving the walls three-quarters of an inch thick. The pulp is then chopped fine, and two tablespoonfuls of bread crumbs, a tablespoonful of melted butter, pepper and salt added. Half a cupful of chopped ham, and the same amount of chopped chicken or veal, stirred in, is a great improvement, but may be omitted if not at hand. The shells are then filled with the prepared eggplant, which should be moistened with soup stock or gravy so as to make a stiff paste; it should be nicely rounded on top and covered with buttered crumbs. Lay the two halves in a baking dish, pouring some soup stock around them, and bake one hour basting frequently, then remove the eggplant, thicken the stock with browned flour, and pour this sauce around the eggplant on a hot dish.

Acetylene Gives Double Value

Acetylene not only supplies good light for the farm home, but cooking fuel as well—the hundred and one "systems" that Acetylene has crowded out, all furnish light only. Acetylene gives the Country home owner double value for his money. As a result Pilot Lighting systems now outsell all others. We are today the largest manufacturers of light plants in the world. We have a big Eastern factory in Newark, N. J., and a big Western factory in Chicago.

Pilot Acetylene Generators are important and necessary features of modern Country Home equipment—just as necessary and quite as permanent as a bath room or a heating plant.

You simply feed your Pilot the gas producing stone Union Carbide, about once a month—the Pilot does the rest. Automatically it makes gas just as you use it — just enough to supply you with brilliant white light in your home and barns and cooking fuel for your kitchen range. *Pilot* plants have brought the greatest of City conveniences to the Country. Write for names of satisfied users in your district.

Live Stock and Dairy

Starting With Blemished Purebreds.

WITH limited means I wish to start breeding registered Holstein cattle, and am seeking advice as to best methods. My own idea is to buy a well-bred cow with an official record, a cow that has some blemish like a lost quarter or big knee or knocked-down hip, one that the fancy breeders would not like to have around when the visitors come, she to be already bred to a bull of merit. Does the average heavy milking Holstein cow give milk rich enough to pass Massachusetts standard, 12.15 total solids, 3.35 butterfat. C. W. P.

New Hampshire.

The method suggested by C. W. P. of entering the field of purebred live stock breeding is meritorious, and there is no reason why animals that may have met with an accident as suggested should not prove useful breeders, and serve well as foundation stock. It very often happens that large breeders in their endeavors to establish world-breaking records go a little too far, and as result udder troubles prevail, and the animals do not present an attractive appearance in the regular dairy. He should make clear, however, that this is the real cause for wanting to sell such an animal, rather than an excuse justifying such offering; and furthermore, there should be abundant evidence that the cow while in her prime was not only a producer, but an animal of individual excellence and merit. Blemishes such as swollen knees or enlarged hocks or other unsightly appearances do not in any way effect the animal's ability to reproduce if properly mated, and often times it is possible to buy such animals at low cost. Only a few days ago I visited a dairy herd in New Jersey made up of grade cows, and the owner pointed out to me a certain animal in the herd that had been purchased from a prominent breeder because he did not care to keep her in the herd, since her udder was so pendent and unsound. Nevertheless, during the past year she produced over 15,000 pounds of milk and a calf that was eligible for registry. She was purchased at a lower cost than the average grade dairy cow, and will serve well as foundation stock for this breeder. I have always maintained that the use of discarded females or of aged bulls whose usefulness has been definitely tried and whose value has been established is the best source from which to select breeding animals for the poor man or the beginner who desires to enlist in breeding work. It is entirely an appropriate means, and by all odds commendable.

In reply to the inquiry as to whether Holstein milk alone will meet the Massachusetts requirements, quoted as 12.15% total solids and 3.35% butterfat, it is possible that a great many Holstein cows would not meet this requirement, especially during the early period of their lactation. The most economical means of meeting this condition would be to purchase a few grade Guernsey or Jersey cows, and thoroughly mix all milk, and in this way enable the dairyman to meet the requirements of the State without question. Where a large herd of Holstein cows is maintained, care should be exercised to avoid having a large number of them freshen during the Spring when the flush flow prevails. There is no reason why a selected herd of Holstein cows varying in their lactation period should not produce milk of sufficient quality to meet the State requirements. It would seem most unfortunate if the standard as fixed by law would brand a man a criminal who sold pure unadulterated milk as drawn from healthy cows without changing its form or content in any way. F. C. MINKLER.

Red and White Holsteins.

IS it possible for a purebred Holstein cow to drop a red and white calf when the sire is a registered Holstein? The calf is well marked for the Holstein if the red had been black. Is there a strain of the red and white Holstein? The dam is of the De Kol family, and is said to be eligible to registry. J. S. J.

It is possible for a purebred Holstein cow to drop a calf marked red and white, even though the animal be regularly registered in the recognized herd book as established for this breed. Such animals, however, are not eligible for registration in the Holstein-Friesian Herd Book. In Holland it is quite common to see a cow other than black and white in color that is designated as a Holstein. It is probably due to an atavistic or "breeding back" character, since a portion of the foundation stock used in establishing the Holstein-Friesian breed were red in color, and their progeny may at times evidence such dormant characterstics. I would want to make sure, however, that the Holstein cow had not been running in a pasture where a stray bull of one of the common beef breeds may have been active, for often times it is easier to explain the appearance of red markings in calves in this way rather than by means of historical evidence as suggested. The Secretary of the Holstein-Friesian Association at Brattleboro, Vt., could no doubt give additional information as to prevalence of such colored animals. F. C. MINKLER.

THE Bureau of Animal Industry at Washington decided that what is known as the glanders vaccine is not satisfactory for making horses immune from the terrible disease of glanders. The substance known as mallein is effective in discovering the presence of the disease in a horse, but has not shown any positive value in curing the animals. It has been tried carefully with the result that the Bureau advises killing all affected horses and keeping the well ones away from them.

BRITISH DOG QUARANTINE.—It seems to be very difficult to get a dog into the British Islands. There are strict laws providing for this. No dog from a foreign country can be landed in Great Britain unless the owner has obtained a license from the British Board of Agriculture. Upon landing the dog must be kept in quarantine for six months at the expense of the owners. The regulations are very strict, and any violations will render the offender liable to prosecution, and may cause the destruction of the dog. If it were possible to apply these strict regulations against dogs which work into a sheep-growing community, there would be more wool and more mutton.

"S-S-S-S-SUS-SAY, ma," stammered Bobby, through the suds, as his mother scrubbed and scrubbed him. "I guess you want to get rid o' me, don't you?" "Why, no, Bobby dear," replied his mother. "Whatever put such an idea into your mind?" Oh, nuthin'," said Bobby, "only it seems to me you're tryin' to rub me out."—Onward.

PREVENTING NAVEL AND JOINT DISEASE

I SHOULD like to see an article on the care of the newly-born colt's navel. Should it be tied? Should it be disinfected? S. C.

Morris, N. Y.

The disease is due to filth germs entering the system by way of the raw navel stump at birth. The germs are found upon dirty floors, and in contaminated bedding. They may form in a decomposing clot of blood caused by tying the navel. The germs cause an abscess at the navel, and from it pus germs are carried into the system and cause secondary abscess, notably in the joints of the extremities, but also in the liver or other parts of the body in some cases. The disease may be prevented by cleanliness and disinfection. Have the mare foal in a roomy box stall that has been cleaned, disinfected with a 1-1000 solution of bichloride of mercury and then whitewashed with fresh-made lime wash. This should be freely applied to walls, floor and ceiling. Then put in fresh clean bedding. When the foal is dropped free its mouth and nose of membranes and at once attend to the navel. The navel cord (umbilicus) should only be tied (ligated) when absolutely necessary. It is much better to have the cord break off naturally. If the mare is lying down make her rise and the cord then may break. If it does not break it should be severed by means of an ecraseur or emasculator or scraped through with a clean, disinfected knife, after ligating, an inch or so from the body and then two or three inches lower, with clean strings soaked in a five per cent. solution of carbolic acid. Just as soon as possible afterward, the string on the stump of the navel should be loosened (a bowknot having been tied when it was put on) and if it is seen that bleeding will not occur the string should be removed. The stump of the navel should be thoroughly saturated with tincture of iodine at birth, whether a string is used or not, and then should be frequently dusted with a mixture of equal parts of finely powdered alum, boric acid and starch powder until well crusted over. Iodine should be freely applied again if it is seen that the stump of the navel is wet. Another good treatment is to saturate the navel at birth with a 1-500 solution of corrosive sublimate and then use the solution twice a day until the navel shrinks up, drops off and no raw spot can be seen. Where the disease has been prevalent a graduate veterinarian should be employed to give the foal a protective hypodermic dose of antistreptococcic serum at birth. The serum also should be used should infection occur.

In addition to caring for the navel at birth it is highly important to see that the bowels move promptly and fully soon after birth. The first manure (meconium) is a sticky substance which tends to adhere to the lining of the intestinal tract unless brought away by the action of the first milk (colostrum) which contains a purgative principle. To assist nature give the foal rectal injection of a few ounces of warm water and a teaspoonful of glycerine, or inject warm sweet oil or slippery elm bark tea, or molasses, cream and warm water. Do not inject large quantities of strong soapy warm water. If the bowels do not respond promptly give the foal two or three tablespoonfuls of best castor oil shaken up in milk. Before the foal is allowed to suck for the first time wash the mare's udder with a two per cent solution of coal tar disinfectant or carbolic and then rinse off well with warm water. Afterward keep the udder clean. Burn or bury all soiled bedding and the afterbirth, and put in new clean bedding as soon as the foal has been attended to and the mare has "cleaned." Few losses will occur if these simple instructions are carefully followed.

A. S. ALEXANDER, M. D. C.

May 19. The following are prices received by ranchers. Fat cattle from $6.50 to $7.50 per cwt.; hogs $8 per cwt.; mutton sheep $5 per cwt.; dairy cows from $70 to $100 each. Good heavy horses from $400 to $600 a pair. Wheat 85; oats 48; potatoes 40 cents per cwt.; onions $3 per cwt.; beets $1.25 per cwt. Strawberries $2 per crate; rhubarb three cents a pound; apples from $1.50 to $2.50 the box. Ranch butter 25 cents a pound. H. J. J.

Purebred Registered

HOLSTEIN CATTLE

The Wisconsin Farmer notes that fewer and fewer of the Wisconsin farmers are content to milk and care for cows that are able to produce only about 150 pounds of butter. During two weeks last Spring 145 Wisconsin dairymen purchased registered purebred Holstein sires in order to improve their herds.

Everywhere the more progressive dairymen are alive to the necessity of using **bred-for-production** sires in order to bring up the butter-fat yield of their cows to a profitable figure.

Bulls of Island Blood

Thirty-eight Island-bred Jerseys have been carefully selected for use at Meridale Farms. Every one of them is backed by prize-winning and butter-tested ancestry; and through authenticated test work, year after year, they are building a solid reputation in America.

Several bull calves of this breeding are for sale. Among them is a son of The Owl's Oxford Prince 95699 out of Raleigh's Pretty Karnak 252135, dropped December 27, 1913, and a most attractive individual. His breeding combines the pedigrees of our two leading Island bulls, for his dam is full sister to The Imported Jap 75265, sire of 15 tested cows.

The story of our Island Family is told in "Meridale Jerseys." Have you seen a copy? Mailed on request.

MY 60 DAY TRIAL OFFER

SEND NO MONEY

I don't ask you to send me a single cent until you have tried **Sal-Vet** on your own stock and proved to your own satisfaction that it does all I claim. I guarantee it will rid your hogs, sheep, horses and cattle of stomach and intestinal worms—the blood-sucking, disease-breeding pests which cause the loss of millions of dollars' worth of stock every year.

The Great LIVE STOCK Conditioner

The Great WORM Destroyer

is doing wonders for live stock owners everywhere. Read these sample letters:

"'Sal-Vet' is doing fine work for my hogs. Before feeding it I had lost 38 head of hogs, but since feeding it I have not lost a single one, and they are looking better than they ever did." T. C. CORL, Bellefonte, Pa.

"Am well pleased with the 'Sal-Vet' which I am feeding to my herd of Hampshire hogs. Since having access to 'Sal-Vet' they look better than they ever did before and on less feed." W. A. WARNER, Elk City, Kansas.

Fill Out the Coupon

and I'll ship you enough **Sal-Vet** to last all your stock 60 days. You pay the freight on arrival and if it does not do what I claim you won't owe me a penny. You take no risk. Send TODAY.

PRICES 40 lbs., $2.25; 100 lbs., $5; 200 lbs., $9; 300 lbs., $13; 500 lbs., $21.12. No orders filled for less than 40 lbs. on this 60 day trial offer. Never sold by peddlers nor in bulk; only in Trade-Marked Sal-Vet packages. Shipments for 60 days' trial are based on 1 lb. of Sal-Vet for each sheep or hog, and 4 lbs. for each horse or head of cattle, as near as we can come without breaking regular sized packages.

Q74)

A New Test for Tuberculosis in Cattle.

THE more recent application of tuberculin as a test for tuberculosis in cattle and hogs, known as the intradermal test, has been favorably reported on by the Agricultural College at Berkeley, Cal. This test differs from the ordinary tuberculin test chiefly in that tuberculin is injected into the deep layers of the skin instead of beneath it and more directly into the circulation. The reaction to this test is noted, not in an elevation of temperature shown by infected cattle, but by the formation within a few hours after the injection of a more or less well defined swelling at the site of the puncture. This swelling appears in infected cattle only and varies in size from that of a hazelnut to that of an orange. The preferred site for this injection in cattle is one of the two folds of soft skin just beneath the base of the tail.

Since the reaction to the intradermal test depends upon a swelling at the point of injection and not upon a variation in the animal's normal temperature, it possesses the advantage of not being dependent in any way upon changes in the methods of handling or feeding cattle, nor is it affected by advanced pregnancy, recent parturition, or the period of heat. It has the disadvantage, however, of requiring the services of one who has had experience in the observation and interpretation of the reaction. It is not a method for the layman, or for the veterinarian either, unless the latter has qualified himself by use of the test to correctly read his findings.

The investigators at Berkeley do not recommend the intradermal test as a universal substitute for the better known subcutaneous injection of tuberculin, but they believe it to be more convenient for use under certain conditions, and probably as reliable. They strongly urge that only those who have qualified themselves to do so should attempt to make a diagnosis by its aid, but as experience in its use is easily gained by those making tuberculin tests they consider it a valuable addition to the veterinarian's equipment for detecting tuberculous cattle and they advocate its more general use.

M. B. D.

"Woman Killed by a Bull."

THE following item recently appeared in the daily papers:

WABASH, Ind., May 3.—Mrs. Philip Lembarger, wife of a farmer, was gored to death by a bull to-day. She was crossing a 40-acre field with her 12-year-old daughter when the animal attacked her. Dr. A. E. Rodgers, who was passing, armed himself with a pitchfork and went into the field, but was immediately set upon by six steers. For 30 minutes the doctor fought off the animals, with the unconscious woman at his feet and the little girl clinging to him. He and the child finally were rescued by some men, but Mrs. Lembarger was dead when they picked her up.

While it is well to take most newspaper reports with some allowance, this story may be true, but the reporter failed to say what the bull was doing while the rescuer was fighting the steers. A well-trained bull, one that has not been teased till cross and vicious, and when out in a field with other cattle, will seldom molest anybody, though strangers gaudily dressed might be chased out, but for steers to fight anyone of their own initiative is very improbable. In the case referred to the steers were undoubtedly excited by the actions of the bull, and for the time were highly dangerous to anything or person opposing or fighting them. Trouble of certain kinds seem to cause cattle to go mad, and the mania seems to spread quickly through a bunch, just as a panic of fear does, and what are ordinarily quiet steers, gentle family cows and peaceable bulls become veritable demons without fear or sense of pain. Occasionally polled cattle will scrap among themselves, though they do not often get mad enough to hurt each other. I recall a bunch of polled steers that seemed to spend one-third their time butting each other and milling around in circles, perhaps three or four at a time and for a half hour or more. They would be eating quietly at the racks one minute, and perhaps the next they would be out in the open field milling around as described and apparently without cause for the quarrel. Live stock and poultry both, at times attempt to kill weak, maimed or ailing members of the flock, or else they let them severely alone.

It is the unusual that excites cattle, which start up to investigate, and about that time timid women or children wave an apron or start to run, and if a bull is present or even wild, excitable steers, trouble may occur. Sometimes the cattle want salt, or they start to chase a dog accompanying some one, and if the weather is cool and bracing and the proper state of excitement is reached, a tragedy may result. Though I understand cattle pretty well, and do not fear them, I do not take unnecessary risks; while I keep them gentle and as unafraid of me as possible yet I let them know that I am the boss. Barring minor accidents I can report no personal injury from cattle, but kicks from both horses and cattle are to be expected and guarded against. Don't trust any kind of live stock too far.

Ohio. W. E. DUCKWALL.

The Draft Horse Situation.

THE Percheron Horse Society of America issues the following table to show the number of vehicles in use inside the city limits of Chicago. This represents the number of licenses issued for the three years:

1-horse vehicle....	40109	38429	38305
2-horse vehicle....	17640	16728	15851
3-horse vehicle....	331	325	256
4-horse vehicle....	34	20	17
Auto delivery wagons (less than 1 ton)	436	1680	2448
Auto trucks (1 ton or over)	363	1155	1759

The decrease in one-horse vehicles is properly to be credited to the rapidly increasing use of auto trucks less than one ton, which are particularly adapted to light delivery work. The decrease in two-horse vehicles is attributed by the men who are best informed on team requirements in Chicago to be due to the elimination of light pairs which are used for delivery work by the large department stores, and to the reduction in light pairs owned by well-to-do persons who used them for pleasure purposes. The closing out of a large number of livery stables and consequent sale of driving pairs owned by them, is responsible for several hundred other horses, so that it appears certain that the reduction of 1789 two-horse vehicles which has occurred between April 30, 1911 and April 30, 1914, is due to causes just noted and not to any reduction in the number of draft pairs in use; in fact, it is the judgment of some of the best informed horsemen at the Union Stock Yards, after a review of the above figures, that there has actually been an increase in draft pairs. It is figured that the auto trucks and business vehicles have displaced about 10,000 horses. These trucks are mostly used for long hauls. For the shorter hauls big horses are still preferred, and there is no present indication that the demand for high-class draft horses will fall off.

WHEN you write advertisers mention THE R. N.-Y. and you'll get a quick reply and a "square deal." See guarantee editorial page.

MANY farmers who market their own high grade butter are getting 5c more a pound since using Worcester Salt —for this reason:

Its fine even crystals work in most easily. Their *clean, sweet* flavor brings out the finest flavor in your butter. And the better the flavor—the better the price. Always use—

WORCESTER SALT

The Salt with the Savor

For farm and dairy use Worcester Salt is put up in 14 pound muslin bags and in 28 and 56 pound Irish linen bags. Smaller sizes for table use. Good grocers everywhere sell Worcester Salt. Get a bag.

Send us your dealer's name and address and we will mail you free of charge, our booklet, "Butter Making on the Farm."

NEW YORK

CRAINE SILO

IT CAN'T COLLAPSE

The Craine Patent Triple Wall Silo has thick vertical wooden staves, inside; horizontal patent wooden covering thoroughly nailed, outside; and water-proof felt-like rubber roofing between. This makes a perfect non-conductor of heat. SCIENTIFIC in every feature of its construction.

IT'S FROST-PROOF
AIR-TIGHT PERMANENT

No silage spoiled by contact with concrete, tile or any mineral. Craine silage is sweet, clean and perfectly preserved—it is "drawn from the wood." No troublesome iron hoops requiring annual overhauling. The first cost is low and is the last. The Craine is, therefore, the cheapest on the market. Ask for illustrated booklet.

W. L. Scott Lumber Co.

Norwich, N. Y. Milwaukee Wis. Kansas City, Mo.

Cuts silage evenly

Packs better—lasts better—makes better feed

The knives of the Blizzard make a clean, shear cut and the silage is cut slick as a whistle, in even lengths, from ¼ to 1½ inches. Silage cut by a

BLIZZARD Ensilage Cutter

packs better, keeps better, and, according to our customers, makes better feed, increasing milk yield and butter fat.

OTHER GOOD POINTS

of the Blizzard are: Light running—any farm engine runs it. Eats up silage fast as you can feed. Easily fills highest silos. Simple, safe and durable. Self-feed table. *New catalog tells whole construction.* Write for it now, before you forget.

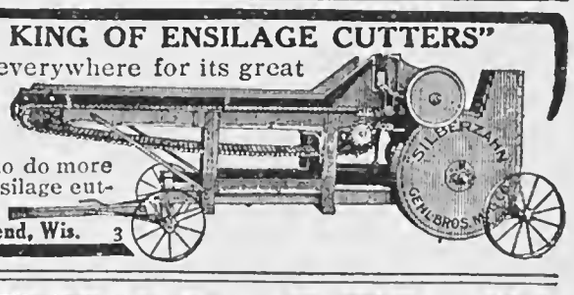
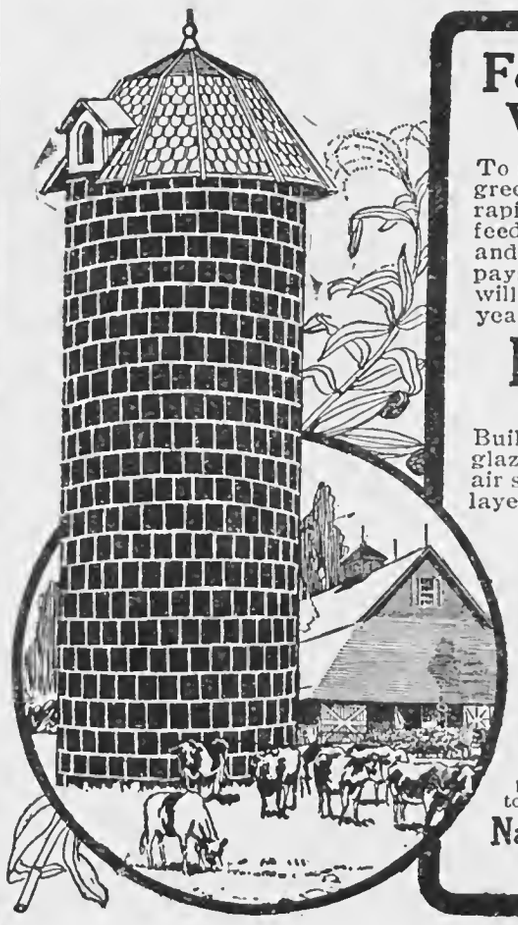
GEHL BROS. MFG. CO., 107 S. Water St., West Bend, Wis. 3





Feed Ensilage This Summer When Pastures Get Low

To secure the maximum results, stock should be fed green feed all the year round. Its succulence produces rapid growth and a heavy flow of milk. No other feed equals ensilage in succulence. It is as valuable and economical to feed in summer as in winter. It pays, then, to fill a silo for summer feeding. You will keep ensilage succulent and palatable all-the-year-round as the day the corn was cut, if you have a

Natco Imperishable Silo

(Patented)

Built of non-porous vitrified-clay hollow blocks; its glazed surface excludes air and moisture. The two dead air spaces protect contents from heat and cold. Each layer of blocks is reinforced by continuous steel bands.

Weather Proof — Decay Proof — Vermin Proof — Fireproof

The Natco Imperishable Silo will last for generations — any mason can erect it — never needs painting — walls will not warp or shrink — no hoops to tighten — no continual repair bills — the first cost is practically the only cost. The Natco Imperishable Silo has a survival value unequalled.

FREE SILO BOOK. Full of information about ensilage and summer feeding. Describes completely the Natco Imperishable Silo. Write today. Ask for catalog "L"

GUINEA PIGS—My whole breeding stock. Solid blacks, whites, rods, and mixed. None better; some worth $3 to $5. 60 or more in lot, $40, or will divide fairly in 2 lots at $20.
F. W. FLETCHER, Auburndale, Mass.

The Henyard.

THE EGG-LAYING CONTEST.

NOTWITHSTANDING the fact that the broody season is now in full swing, the loss in egg production for the twenty-ninth week is only 31 from the high record of 3,649 last week. The White Leghorns from England and from Ohio, tie for first place with the high score of 61. The single pen of Buff Leghorns from Wolverine Poultry Yards take second place with a score of 59, and Braeside Poultry Farm's White Leghorns are third with a record of 58. Francis F. Lincoln's White Leghorns tie with Geo. A. Cosgrove's pen of same breed for fourth place, each pen laying 57; 27 pens in all laid from 50 to 56 each, including H. W. Collingwood's pen of scrubs—as he calls them—which laid 54, making a higher score than any of the Rhode Island Reds, Buff Wyandottes, White Wyandottes, Buff Rocks, and 10 other varieties. In fact there was 64 pens out of the 82 in the contest, that laid fewer eggs than Mr. Collingwood's "scrubs." It begins to look as if those who laughed at these "scrubs" at the beginning of the contest were somewhat premature in their mirth. Below is the week's record and the totals:

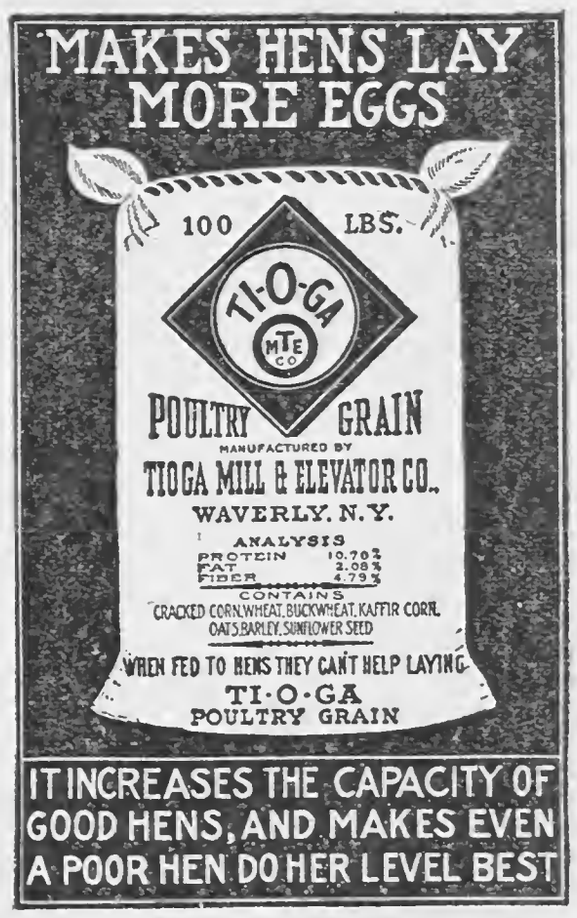
Lightning Rod—tested 65 years!



PUBLISHER'S DESK

Can you give us any information regarding C. Abramson, 233 Madison Street, New York? I shipped him a crate of eggs April 6 and he sent me a check for them, but the check came back unpaid, as there were no funds to pay it. In the meantime I had sent another shipment and now cannot hear from Mr. Abramson. He promised to pay 28 cents a dozen. Can you help find him? A. R.
New York.

We have 13 complaints from farmers, aggregating $200, including two shipments made Mr. Abramson in 1911 which are unadjusted. This amount has been lost because of failure to investigate the standing before making shipments. His initial inquiry was for trial shipments at 28 cents per dozen. When inquiry was made why shippers had not received returns he claimed checks were lost or tags had come off cases and he could not tell who was the shipper. We are informed that he sent out something like a hundred checks dated ahead, all of which were protested when presented. His office was in a basement, but he has moved now and the advice is that he has gone to Pittsburgh. He will probably play the same trick on shippers from that point. His removal was doubtless planned in advance as this is usually the case with concerns sending out quotations above the market price.

A poor woman who is in my employ and who has a child to support, was induced by H. H. Tilley of 68 Valentine Ave., Mt. Vernon, N. Y., to give him $50 for an old phonograph which was not worth $15. It took this woman a long time to save this money and the loss of it means privation to herself and her child. Will you please write to Mr. Tilley and see if you cannot induce him to take back the machine and refund the money? A. C. O.
New Jersey.

After addressing several letters to Mr. Tilley he called on us and gave his version of the transaction but refused to accept return of the machine. At the time of his call he made an offer of $15 in settlement which offer he since withdrew and now agrees to refund $10 of the money.

I have been approached to buy some of the International Text Book Company stock of Scranton, Pa. I inclose you some of their pamphlets. I have declined the opportunity to purchase. I could get no statement from the salesman that would show the necessity of selling this stock if it is as good to hold as represented. I would like a copy of the paper in which you referred to this matter. S. E.
New York.

One of the pamphlets states that the agents of the company are now to be sent into small towns and country districts in which they have not heretofore operated. It claims that the rural territory is most productive for them, and that country boys and girls are easiest enrolled. According to this pamphlet the country districts are to be canvassed by these agents and solicitors, and for this reason it may be well to restate some facts that have been said before.

The concern has an army of agents soliciting the scholarships. These agents and the advertising literature of the company encourage every proposed student to believe he can manage the courses, and better his position and greatly increase his income. Contracts are made with people who are not able to follow the work, and after a short trial give it up. They pay the first installment, and while they get no benefit whatever, the company enforces payment for the balance of the contract. This inflicts rather a severe hardship and loss to some young people who can ill afford the loss.

As to the stock investment, a bill is before the Massachusetts Legislature to enforce this and other correspondence schools selling stocks to file information about them with the State Corporation Commissioner. In a hearing before the legislative committee which is considering the bill, a representative of the Scranton concern stated that the bill was aimed at them, and that the bill was introduced to make the International Correspondence School pay money to prevent its passage. Representative Clarence A. Barnes of Mansfield, who proposed the bill, is reported to have said:

These people, one way or another, are reaching a lot of poor people and inducing them to invest in securities. Now when a man buys of a stock broker he appreciates it is purely a commercial transaction, but when a school attempts to sell securities it assumes a fiduciary relation towards its pupils.

"Instructors of these schools," he charged, "and their agents go into the homes of students, get into their confidence and ascertain how much money they have in the bank. They will then remark that 'if you have any money to invest and ever get a chance to buy stock in this Lackawanna company (for instance), get all you can of it.'

"Three or four weeks later a salesman from the Lackawanna Coal & Lumber Company puts in his appearance and makes an easy sale of stocks. The instructor gets a rake-off for 'tipping off' the salesman and at least one higher official receives a share."

Mr. Barnes cited the case of a poor widow in Roxbury who, he said, invested $650 in one company because one of her boarders, a student of the correspondence schools, had told her to purchase the stock. Later she learned that the student had received a commission of $10 for the "tip" he had given the company.

We have seen volumes of literature on the several companies promoted by the men connected with the Scranton concern, but we have not seen anything that would give an intelligent idea of the value of the stocks. They lay great stress on the fact that the International Text-book Company stock is in the hands of good people, and that it is not sold on the exchanges, and that the price is maintained by the company. Instead of being arguments why you should buy, these facts are reasons to us against buying the stock. So long as the company pays the dividends, and sells through agents, and takes the stock off the hands of those who want to sell it, all is well, but no purchaser has any guarantee that the dividend will be paid in the future, no person has any guarantee that the stock will be taken off his hands later on. The company may not pay dividends in the future. It may not continue to sell the stock over again. It may do neither; and in such case the holder of the stock would find no market for it.

It is not enough that a stock pays dividends, and that the promoters of it, buy it up again to maintain the price. Dividends are often paid for a time on worthless stocks, and the fact that the promoters organize an agency to take up the stock and sell it over again is evidence that the stock does not sell on the open market on its merits at prices established for it. The Massachusetts Legislature will do well to pass its bill. Why shouldn't this concern furnish information to show whether or not the poor people of the State are getting value for their money?

I send you part of the correspondence between C. L. B. Landis of Reading, Pa., which shows that he owes me $8. I have made various efforts to secure payment, and I take the liberty to ask you to do by me as you have by some of your other subscribers and attempt to make the collection. I will be much obliged whether you can collect or not. J. H. R.
Maine.

From a mere sense of duty we have been trying to get this settlement from Mr. Landis. We failed as we expected we would. We have had complaints of him for 15 years or more, and do not recall a single adjustment. We expect no redress for complainants. Our only hope is to lessen the number of them.

Please make me a formal member of the Uhlman Club. I have long been an actual, acting member, having dropped the Success magazine because of the Lewis advertisement, and long years ago shunted that Indianapolis fake, also let go of a farm paper whose editor was and is master of the diverse problems that confront the soil tiller here. Please publish the pledge again. Every farmer should join and all should live up to the pledge, although sometimes it will hurt. As I am pledged to be a life member of THE RURAL NEW-YORKER fraternity, enclosed is my subscription. G. F. M.
Florida.

The Anti-Fake Club is growing. A few more members and we will form our organization. When this is done, a definite pledge will be drafted, and suitable regulations prescribed. The idea of the organization is to discourage dishonest advertising by calling the attention of publishers to them and by refusing to receive papers the publishers of which persist in printing the advertising of fakers and rogues. J. J. D.

Results Compared with Theories

Here we have:	*There they have:*

Products, Prices and Trade.

Wholesale Prices at New York,

Week Ending May 29, 1914.

MILK.

The Borden milk schedule to producers for the six months beginning with April is as follows, compared with last year. This is per 100 pounds in the 26-cent zone. For the 29 and 32-cent zones the schedule is 10 cents less for all months:

	1914	1913
April	$1.40	$1.50
May	1.15	1.25
June	1.10	1.10
July	1.25	1.35
August	1.40	1.45
September	1.50	1.55

Figuring 86 pounds to the 40-quart can the per quart price is as follows: April, 3.01 cents; May, 2.47; June, 2.36; July, 2.68; August, 3.01; September, 3.22.

Wholesale prices paid by New York dealers are running $1.51 and $1.41 for B and C. Hotels and restaurants using two to three cans per day are paying 4¾ to five cents per quart.

BUTTER.

The market has been somewhat stronger this week with advances of one-fourth to one-half cent on the better grades. The quality of the current receipts is running better.

Creamery, extra, lb	25	@	26½
Good to Choice	22	@	25
Lower Grades	19	@	21
State Dairy, best	24	@	25
Common to Good	18	@	23
Factory	16	@	19
Packing Stock	13	@	17

Elgin, Ill., butter market 25¾ cents.
Philadelphia, western creamery, 26 cents.

CHEESE.

The market is decidedly firm on the better grades of whole milk. A small amount of business at 14 cents is noted, but not enough to warrant an advance in quotations.

Whole Milk, new, best	13½	@	13¾
Common to good	11	@	13
Skims	5	@	10

EGGS.

Quality of the bulk of receipts is averaging poorly, owing to hot weather. Large quantities of medium grade eggs are going into short-time storage on shippers' price limits.

White, choice to fancy, large	22	@	23
Common to good	18	@	21
Mixed colors, best	21	@	22
Common to good	17	@	20
Western fresh, white	20	@	21
Lower grades	15	@	18

FRESH FRUITS.

Apples in large supply and market very weak. Strawberry receipts are increasing and prices very low, from three to 10 cents wholesale. A few huckleberries from North Carolina have arrived wholesaling at 25 to 30 cents per quart. Several carloads of Florida watermelons are in this week bringing $60 to $70 per 100.

VEGETABLES.

Old potato market very weak and lower, sales of good quality running from $2 to $2.50 per 180 pounds, with the outside price extreme. Asparagus low, owing to heavy receipts from nearby. Cabbage selling well, at 75 cents to $1 per barrel. Peas in good demand. String beans generally poor. Lettuce in great surplus.

Candy is made to a large extent in Boston. 30 manufacturers turning out 50,000 tons yearly. One concern alone makes 30,000,000 pounds.

LESTER H. LATHAM, Auctioneer, HILLSBORO, N.H.

AUCTION SALE

THE NOTED VALUABLE MANSFIELD STOCK FARM CHAMPION and BLUE RIBBON PRIZE BROWN SWISS STOCK at ESSEX JUNCTION, VT.

The Farm Machinery and Tools will be sold Wednesday, June 10. The Stock, Horses, etc., Thursday, June 11.

In this herd there will by found such stock as Benjamin C. 3437 bred by E. M. Barton, Hinsdale, Ill. Silken Pride 4476 bred by Fernando Wheeler, Stonington, Conn., and many others by the best breeders of Brown Swiss. In the past few years Mr. Carl Robbins, the former owner, has bought and bred the best blood that could be found in this country. All to be sold without limit or reserve.

For complete description and photos of farm buildings and breeding of stock, write or phone the auctioneer. Homer Parker, resident manager, will show property before sale.

ROYAL S. WENTWORTH, Owner, Chelsea, Massachusetts

QUEEN BEES—Now is the time to get gentle hustling bees and more gilt-edged honey by introducing one of my thoroughbred Italian queens. Send $1. for laying queen with full instructions. Circular free. R. A. NUSBAUM, Duncan Falls, Ohio

FOR SALE—Choice Three-band Italian Queens. Tested—$2; untested, after June 1—$1. Write for booklot. W. K. Rockwell, Bloomfield, Conn.

Subscribers' Exchange

Complying with several suggestions received recently, we open a department here to enable RURAL NEW-YORKER readers to supply each other's wants. If you want to buy or sell or exchange, make it known here. This Rate will be 5 Cents a word, payable in advance. The name and address must be counted as part of the advertisement. Copy must reach us not later than Friday to appear in the following week. No display type used, and only Farm Products, Help and Positions Wanted admitted. For subscribers only. Dealers, jobbers and general manufacturers' announcements not admitted here. Poultry, Eggs and other live stock advertisements will go under proper headings on other pages. Seed and Nursery advertisements will not be accepted for this column.

WOULD LIKE WORK ON FARM—Cannot milk. LLOYD DAVIS, care Albert Fuller, West Valley, Catt. Co., N. Y.

WANTED ALL AROUND BLACKSMITH—Will hire or help set up in business. B. C. WOOD, Wheeler, New York.

WANTED—Intelligent, energetic woman or man to work on mouse farm, July or longer. A. LATHROP, Granby, Mass.

POSITION WANTED BY HOLLANDER—Single; good milker, teamster and acquainted with all farm machines; state wages. Address A. BONS, care A. Pas, De Bruce, N. Y.

WANTED—Position as herdsman; am a Cornell man, with practical experience in Holstein testing, breeding, feeding, and own veterinary; best of references. J. J. HENRY, DeRuyter, N. Y.

WANTED—Position as poultryman or manager of small truck, fruit and poultry farm by young man, strictly temperate; agricultural college training; life experience; references. R. P., care R. N.-Y., 333 West 30th St., New York.

WANTED POSITION — American, single, 30; temperate; worked for four years on truck and dairy farm; can do carpenter work; farmed two years for myself; best reference. Address STEADY, care R. N.-Y., 333 West 30th St. N. Y.

FARMER WITH LONG EXPERIENCE and efficient manager, open for position to take charge of farm; expert agriculturist, dairyman and fruit-grower; men, machinery and tools; American with small family. E. HOWE, Southbridge, Mass.

ORCHARD SPECIALIST—Single, American, age 25; agricultural school graduate; large experience in fruit growing. Specialties: Apple, peach and small fruits. Open for position as manager for up-to-date fruit grower or orchard company. State particulars fully in replying to HOWARD I. EARL, 228 Westfield Ave., Elizabeth, N. J.

ALFALFA HAY. F. P. ERKENBECK, Fayetteville, N. Y.

MAPLE COVE FARM—Products direct to consumers. ROUTE 24, Athens, Pa.

FARM FOR RENT ON SHARES—Good location. Address X, care R. N.-Y., 333 West 30th St., New York.

WOULD EXCHANGE EQUITY in attractive suburban income property for rent of farm, stock and tools. E. C. MOORE, Maplewood, N. J.

FOR SALE—Fruit and poultry farm; 32 acres; excellent land; good water; cherries, plums, pears and apples for market; fully equipped poultry plant; 10 minutes walk to station; telephone and R. D. GEO. WHITENACK, Skillman, N. J.

WANTED—A 200-ACRE FARM near railroad, with good buildings and fertile soil adapted to general farming; must be located within 100 miles of New York City and near navigable water; owners only. G. W. K., care R. N.-Y., 333 West 30th St., New York.

FOR SALE—Fruit farm, 140 acres; 600 bearing apples last year; prospect 500 this year. Price $4,000. For particulars apply C. G. ADAMS, Colerain, Mass.

FOR RENT—Couple would rent very reasonable half of a large, modern farmhouse in Southern New England (Rhode Island); high ground; fine view of ocean and country; ideal for elderly couple or party seeking health. Address SUNNYSIDE, care R. N.-Y., 333 West 30th St., New York.

PEACH MOUNTAIN FARM—near Great Serpent Mound, Adams County, Ohio; 572 acres; 10,000 peach, apple, cherry, pear, fruiting now; beautiful location 400 feet above station one mile away; full farm equipment; bargain terms. Write owner, E. E. RICHARDS, Box 563, Columbus, Ohio.

FOR SALE—The East Donegal Poultry Yards; an up-to-date plant, well stocked with poultry and fruit; an old-established business whose shipments include every State in the Union and foreign countries. Reason for selling, the death of the proprietor. EAST DONEGAL POULTRY YARDS, Marietta, Pa.

FOR SALE—Ten-acre farm in village, near Putnam, Conn.; suitable for poultry and fruit; good seven-room house and barn and seven poultry houses; will include one good horse, three wagons, two brooders, 2,000 feet lumber, small tools, and 20 hens (pure-breeds) for $1,700; $800 cash. C., care R. N.-Y., 333 West 30th St., New York.

FARM FOR SALE—Farm of 160 acres, 2 miles from McDonough Village; an excellent dairy farm; good market for milk; land lays level and is easy to till, and under good cultivation; buildings and fences are first-class and in good repair; 150 thousand feet of sawing lumber on the place, mostly hemlock; owner wishes to sell on account of ill health. For price and terms call or address GEO. A. PURDY, Oxford, N. Y., or ALBERT BECKWITH, McDonough, N. Y.

FOR SALE—One of the best dairy farms in Chenango County, 225 acres, in a high state of cultivation; always been occupied by owner, who on account of ill health must sell. Two extra good dwellings; fine 42x90 basement barn, with large shed attached; tool barn, shop, new carriage house, hen house and sheep shed, all painted and equipped with lightning rods; running water in house and barn; large orchard in good condition; 30,000 feet of fine hemlock and large quantity of hard wood; good neighbors and school near at hand; two miles from river; four miles from railroad depot. Price $8,000. C. L. STONE, Oxford N. Y.

What are the elements which enter into Cadillac reputation?

That the Cadillac is regarded with profound admiration the world over, everyone knows.

There is nothing new in the statement that its reputation is international.

And the high favor in which it is held, here at home, is almost a houshold word.

But it is interesting to dissect the elements which go to make this unique reputation.

Precisely, why is the Cadillac, by common consent, invariably discussed as a car apart from all other cars?

The average owner would probably express his enthusiasm at first in terms of general satisfaction.

His contentment is so complete that he rarely bothers to analyze its component parts.

But the comforts and the advantages which he enjoys are none the less definite and specific.

It would be practically impossible to persuade any Cadillac owner, for instance, that any other car compares with it in riding quality.

This peculiar Cadillac quality—and it is distinct and distinguishably different—has its immediate source in the two-speed direct-drive axle.

But far back of that—underlying it and emphasizing it—is the principle of intense standardization, interchangeability, correct alignment of its parts and units and the harmonious operation of those units with one another.

How much these contribute to the exquisite ease and steadiness of the Cadillac, how much they contribute to its constancy and endurance, and how important they are considered as principles, is indicated by the two awards of the world's most significant motor car honor, the *Dewar Trophy*.

These Cadillac features everyone recalls immediately.

But it is equally interesting and important to remember that the Cadillac is what it is—the standard of the world—because of the features which characterize the car itself:

An engine of 40-50 horsepower which those who know motor car engines recognize as unsurpassed in fineness of construction and in capabilities commensurate with its proportions.

A cooling system so adequate that overheating is practically unknown.

A lubricating system so competent, so simple, so free from annoyance that you scarce realize its existence.

A carburetor so efficient, so flexible that it needs acknowledge no superior.

A clutch so smooth, so velvety in its action, so simple and so dependable that it leaves nothing to be desired.

A system of electrical cranking, lighting and ignition (now in its third successful year on the Cadillac) so nearly 100 per cent efficient that it would be difficult to more nearly approach perfection.

A steering mechanism so steady, so safe and so sure,—possessing none of the attributes which might make it otherwise—that you always feel secure.

Axles so strong, so substantial that they are equal to any legitimate demands.

A spring suspension so soft, so flexible, so yielding that it abundantly justifies the popular saying:—"The Cadillac carries its own good road with it."

A car, in all, designed with such consummate skill and executed with such painstaking care that it will uphold the name of "Cadillac" and all that the name implies.

A car, in all, which embodies in surpassing measure, all of those qualities which make motor car ownership desirable.

STYLES AND PRICES

Standard Touring Car, five passenger	$1975.00

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. LXXIII. No. 4259. NEW YORK, JUNE 13, 1914. WEEKLY $1.00 PER YEAR.

A JERSEY GENTLEMAN.

Teacher of Dairying and Determination.

"*WE have with us today*," a Jersey gentleman, Julia's Majesty, A. J. C. C. 89717—the head of the Jersey herd at Deep Spring Farms, New Jersey. Some of you may have attended a banquet or a political meeting at which various notables were to speak. It soon becomes tiresome—the long monotonous round of oratorical hacks who are trotted out to exhibit their mental spavins and repeat their stale jokes and stories.

"*We have with us tonight!*" That is the way the chairman begins, and the audience will brighten up enough to take a look at the new speaker. He is usually some bloodless slouch of a man without enough ambition to square up his shoulders or power enough to keep them squared. The listeners size up his limp nerveless attitude. "There is no speculation" in his eyes. It is evident from his face and form that he has no message to deliver. There will be nothing but platitudes or dodging of the truth from him and his would-be hearers either go out, talk to their neighbors or let their minds go wandering away to more agreeable things.

"*We have with us tonight.*" The chairman repeats the old formula, but this time there comes a man of a different type. His head is up, his shoulders are squared, he looks you right in the eye with that strange spiritual thing which men call personal power. Every listener knows that here is a man with a message—a man who brings a bit of truth cut out of his own experience, and a slice of human nature handed down out of the years. There is something strong and compelling about that eye and carriage, and every man in the room sits up to listen. For power attracts power, and the face of a strong personality will always dominate society.

A JERSEY GENTLEMAN—JULIA'S MAJESTY, A. J. C. C. 89717. FIG. 322.

So when we say, "*We have with us today a Jersey gentleman!*" you look at his face first of all. Here we have the picture of power—strong, masculine and vigorous. Here is no lazy lunkhead or sleepy barnyard boss, but a wide-eyed intelligent king of the herd, full of nerve and pride of royal descent. You never saw a successful racehorse or a prize dairy cow or the father of a high-class business hen who was afraid to look you in the eye, or who went about with a moping, sleepy attitude. On the contrary, such creatures, like this bull, show that touch of wild freedom which has ever given the males of a race or breed the power to dominate and excel. It does not make so much difference where a *man* comes from as where he comes out. He may be rightly classed as a "scrub" as regards his origin, yet by sheer force of personality he may win a place among men which fairly entitles him to the right to "stand before kings." It is different with this Jersey gentleman, for Julia's Majesty comes by his name through the blood of some of the greatest Jerseys that ever lived. Why, if Jersey cattle were human beings this determined looking individual would be a prince of the royal blood. His mother and his maternal ancestors for four generations carried the blood of Julia. The blood of Majesty on the father's side makes him worthy of his great name. This bull has the backing and we see from his face and neck, the power and individuality which gives him value as a breeding sire.

Aside from the great lesson in dairy breeding which this bull and his pedigree teaches we are glad to have this strong, determined masculine face looking squarely into the eyes of our readers. Many of us need the indomitable spirit which this Jersey gentleman shows as we face him. Men can learn much from the so-called lower animals. We wish we had the power to make certain careless, easy-going people go every day and sit down beside a bulldog with a full comprehension of that dog's "message." Such people ought to watch that thick neck, the power of the square jaw and that short nose and the never-die grip of those teeth and realize that Providence had put these things before them as a sermon on the patient, hangdog spirit which they need more than all else. Or, we would like to compel some of these obstinate, selfish, prejudiced characters to sit and watch a woodchuck at its hole. It ought to come to such men in time that they are travelling along the way to the supreme stupid selfishness of the woodchuck. For that creature has been known when hunted by dogs or other animals to run into her hole and push her young ones out one by one to appease the enemy! At any rate we would like to have you keep this picture of Julia's Majesty hanging where you can readily see it. The breeding lesson it teaches and the possibility of herd improvement are wonderful, but the moral and mental lesson may be yet more useful. What? A man learn something of his duty from the picture of a Jersey bull? Why not? Do we not all know times when it would be much easier to shrug our shoulders and say nothing rather than face our duty? Do we not know that the more we shrug and shirk the harder that inevitable duty will become? At such times it will help to have this determined face looking at us and hear the following:

"*We have with us today a Jersey gentleman, Julio's Majesty, and also the gentleman whose duty it is to maintain the majesty of this household.*"

WHY BOYS LEAVE THE FARM.

THE easiest way to explain this puzzling question is to give my own experience. It is as follows:

One sultry July day, while following the plow in my father's cornfield, a happy thought came to me that I could make some "easy money" by harvesting the boneset which grew just over the fence in a piece of waste land. A few weeks later I cut this medicine, cured it very carefully in the shade to preserve its color, stripped the leaves and tops and got it in first-class shape for the market. Then I asked the local druggist what he would pay for my crop of 150 pounds. He said he could not use such a large quantity, and referred me to three prominent dealers in crude drugs. I sent them samples and asked for quotations; my dream of "easy money" vanished, however, when their offer came. The first offered three cents a pound, another 3½, and the last 4½ cents. Having no other choice, I accepted the largest offer and in due time received a check for $5.50. (The jobber had deducted $1.25 for freight.) After paying for the bags I had left just $4.50, about $1.25 a day, the usual wage for a country lad.

Meeting the druggist shortly afterward I asked

him what he charged for boneset. He replied, "Five cents an ounce." Then I got my pencil and commenced figuring. If one ounce cost five cents, a pound would bring 80 cents; at that rate my crop of 150 pounds was worth $120. Then I figured some more and found that the middleman who merely carried my medicine to the consumer got $114.50, while I got only $4.50 for doing all the hard work in the boiling hot sun. Then it dawned on me that I would be silly to stay on the farm and work like a mule for $4.50 when I could go to town and make $114.50 in the easier and more genteel end of the game.

After making this discovery I went home and told my dad that he could never make a farmer out of me, for I was born to be a druggist; so I packed my grip and left for the Ohio State University to take a course in pharmacy. My chum in the country school saw the point too, and left the farm at the same time for Omaha, where he now has two drug-stores and is worth $150,000. I now teach pharmacy in a big university, own a grape fruit grove in Florida, and a cherry orchard in Michigan, and am fairly comfortable. Needless to say that neither of us regrets having left the farm for the easier and better paying end of the game. The foregoing shows very plainly why boys leave the farm. I have given this explanation, not to encourage boys to go to the city and thus escape an intolerable condition but to inspire in them a desire to terminate the unjust conditions.

There is a very simple way to change these conditions, so let me explain: While still in college I got a copy of the 13th Annual U. S. Labor Report, and learned therefrom that practically all of the nation's products are handled on *the same basis as boneset*. By comparing the cost of labor and raw material with the retail price I learned that *it costs from three to ten times more to carry an article to the user than it does to make the article*.

Strange to say, very strange indeed, this astounding fact has not been recognized by our statesmen. However, I am pleased to note that at least one editor is aware of it. The editor of THE R. N.-Y. says "The farmer produces $1.00 wo.th of foodstuffs but gets only 35 cents for it, while the middlemen who merely carry this product to the consumer get 65 cents." This arrangement of the city people for "putting it over" is called a "35-cent dollar." No great skill is required to carry the finished product to the consumer. *Why then, should the middlemen be paid twice as much as the producers?* It is exactly the same as paying an experienced chef $1.00 for baking a cake and a snob of a waiter in a dress suit $2.00 for passing the cake among the guests in the front room. The middlemen are only common, ordinary waiters who, in the world's work, merely pass around the things which other people make by hard labor. They are not entitled, therefore, to such generous pay for so menial a task.

To correct this unfairness of the existing method I have submitted to Postmaster-General Burleson, a plan which will enable him to furnish this distributive service through a Postal Market at a reasonable cost, a cost more in keeping with the menial nature of the work. In the Postal Market all sorts of foodstuffs would be handled in standard packages and grades and the charge would be *just sufficient to cover the actual cost of hauling the product from the farm to the consumer*, via the Postal Market, probably not more than five or 10 cents on the dollar.

Under such an arrangement the farmer would get 90 or 95 cents of the dollar instead of 35 cents. Nearly all of the money that goes to the middlemen would go to *the farmer where it rightfully belongs. In this way alone can the boys be kept on the farm. Make it worth while for them to stay!* As things are now you cannot reasonably expect them to remain, for no one would stay on the farm and work for 35 cents when he could go to town and get 65 cents in the easier and more genteel end of the game. If you would like to have the farmer's income increased three fold in the way indicated, and thereby make farm life sufficiently attractive to keep the boys at home, write to Mr. Burleson and ask him to establish a Postal Market. R. L. GREENE.

R. N.-Y.—Mr. Greene forgets to state that thousands of farmers are already getting more of the 35-cent dollar by direct trade through the parcel post we now have. Let them not only write Mr. Burleson but develop the trade possibilities which they now enjoy.

WE have the report of a farmer who invented an appliance, but lacked the capital to manufacture it. A corporation has infringed the patent, but the farmer would be obliged to mortgage his farm in order to pay a lawyer to fight the case.

ENGLISH WYANDOTTES AS BREEDERS.

I HAVE been much interested in your remarks, as well as Mr. Card's, regarding Tom Barron's White Wyandottes. I can see no use in trying to get up a controversy. I can see no real benefit in anyone trying to prove whether Mr. Barron's birds are straight Wyandottes or not. The fact that Mr. Barron has produced these birds that can beat all comers is sufficient to prove he is a master. The one great thought that occurs to me is just this: Can the progeny of these English birds bred by Americans in America, keep up the good work. That is the real issue from my point of view. The French can beat all comers in raising table fowls. Mr. Barron seems to be able to beat all comers in raising birds that can lay eggs. Well and good; I take my hat off to them, but what about the hundreds of men and women who are and will be sending many dollars for this English stock? Are they going to get stock that will keep up the question? Birds bred to feather and shape are the real backbone to the whole fabric, and the American Poultry Association is the supreme factor of all that has been proven in the poultry world? I feel that those who go in too strong for the English stock will be disappointed, and it won't be Mr. Barron's fault.

There should be no conflict between utility and standard birds, as you call the latter. Anyone, whether standard or utility breeder, can sell birds, but he cannot sell skill. Anyone can buy paper, type, ink, presses, and publish a paper, but in reading THE R. N.-Y. I have arrived at the opinion there is somewhere behind these necessary articles "skill," a real knowledge on how to get out a paper. Change the name, the paper would be just as good, but change the management, and no one can predict the result. No doubt these birds of Mr. Barron's could not win in a show; at the same time I have seen birds that would not win according to the standard produce winners. Now then, can Tom Barron's birds produce birds that can equal his records?

Then again birds as a rule that lay so well are not just the proper breeders; it costs too much energy. I have had some experience along that line.

Let me use a few more lines to congratulate you on your article *re* temperance; it is surely bound to come, this giving up liquor. Men are becoming bolder and now are not afraid to speak out against this evil. I can remember the time at poultry shows drinking was the regular order, not only drinking but drunkenness and today—why, it's only a few who fall down, and they are also looked down on. All things left out just one thing will compel the drunks getting less every year, and that is a purely business proposition. It is bound to come; then there is the nastiness of it, the loss to one's standing, etc., and I trust I'll live to see the day when drunkenness will be only history. I like your paper bully. D. LINCOLN ORR.

R. N.-Y.—As we saw last week, Mr. Barron takes a fair and strong position on this matter. He says in effect—"Here are my birds. They are *layers;* that is all I claim for them, and you are under no obligation to buy them if you have any question whatever regarding their breeding qualities."

IS "BACK TO THE LAND" A FAILURE.

THE back-to-the-land movement is not a failure, although there is a tendency just now to proclaim its end. From 1890 to 1900 there was a decided gain for the country. Since that there has been a check worth looking into. Here in Florida the larger part of migration is made up of Northern farmers, but there is at the same time an increase of those who have been merchants, clerks, school teachers, and not a few ministers. The difficulty all along the line has been the small percentage of those who desire to create homes. A much larger percentage consisted of those who were tired of doing what they were at, or possibly were total failures, and who got the idea that they could enrich themselves out of the land. Three hundred letters came to me in one Winter, about the chances here in Florida. I suppose this large number was due to the fact that I have written two or three books on making homes in the country. But I have never written a book that would mislead the unsettled crowd to imagine it can reap without sowing anywhere.

My answer is invariably, "You can make a living anywhere in the country if you first study the conditions, and are willing to adjust your habits to the requirements of Nature; provided in the next place that you are comparatively healthy, and your family will coöperate with you heartily." There are no two sections in the United States where the conditions are the same. If I had not already a good deal of experience with land and land culture, and considerable knowledge of legumes and soil-making, I would take a Winter in an agricultural college, before gathering in an experience of actual experiment. This applies to old people, both men and women, as well as to young. You must get the knowledge from somewhere, especially the elemental knowledge of gardening and orchard work, or you will make a failure of it. "There is no place on earth today so full of enthusiasm and knowledge combined as an experiment station or agricultural college."

That is what you want, enthusiasm based on knowledge. Do not come here or go anywhere else with a dull suspicion that you are both ignorant and unwilling to do what will be demanded of you. But by all means the chief difficulty, not only here but in every part of the country, is the increased expectation of getting rich. All about me are unsatisfied settlers, who have done nothing for the last three or four years but plant huge fields of melons or sweet potatoes; or invest in orange groves, expecting in every case to become wealthy at once. It was just so in New York, where the country homemakers undertook to get rich on hops and strawberries. Nine out of ten went bankrupt inside five years. One year gives a fine crop of melons, just about enough for the market; and the grower gets through with a full pocket at the end of the season. The next year there will be an over supply of melons, and down goes the price. The speculative grower goes down with it.

Nearby me is the great celery section of Florida, and it has been advertised so faithfully as to bring thousands of planters. Everyone of these planters was after money and not after a home. After two or three years of profitable culture the crash came, and celery was not worth the digging or packing. School ma'ams and school masters and ex-lawyers went back to the city. If you expect to leave city life for country life, there is only one passage for you that will lead to success; and that is you must make a home for yourself and family.

You will be more surprised when I tell you that a country home requires something more than eatable crops. You will not succeed if you cannot induce the birds to coöperate with you. This is not sentiment but facts; and how are you to do this if you do not know one bird from another, and have never cared to understand their meaning and purpose. Is there a brook on your land, I mean the land you intend to purchase? Let me assure you that if you are coming into the country to live, brook power will be of immense importance to you. It can be very cheaply induced to do a lot of barn work, and even light your house.

A recent letter says, "Do you think I can make a success keeping bees, growing vegetables, and raising chickens?" These three things seem easy, but within rifle range of my home there is a chicken establishment, apparently successful, but closing up and selling out as a failure. No money in chickens. I cleared over $150 last year on 40 fowls, and know there is money in fowls. As for bees, they are a very important factor in home-making, to pollenize our fruit, and to furnish us honey. A good home should realize one hundred dollars a year surplus on honey. Some instinct is needed along this line as well as experience. Truck growing is not a matter where one can compete always with success. In all cases you have to know when to back out.

Florida. E. P. POWELL.

AGRICULTURE IN CANADA.

IN Western Canada the cry is "away from wheat." That country has been growing nothing but wheat and oats. This has made it necessary for farmers to pay cash for practically all of their supplies, many of which might just as well be produced on their own farms. "Away from wheat" does not mean giving up wheat growing entirely, but dropping part of it and attempting to produce some other money crop and also part of the supplies which at present must be bought. Among other things, farmers were advised to invest in sheep, and this was done to such an extent that there was a large crop of wool this year. No commercial facilities for handling this wool existed, and new markets must be promptly found. The Department of Agriculture at Saskatchewan stepped in to handle the wool for the Government. Farmers will therefore send their wool direct to the Department and the Commissioner of Agriculture will see that it is marketed properly. Here is a case where if the Government did not act a very large part of this wool crop would be practically given away by the farmers in an unorganized and undeveloped market. Why should not the Government take a hand in such a case?

QUICK FILLING FOR SPRAYER TANK.

Harnessing the Electric Motor.

SOME weeks ago we printed a brief note from F. W. Cornwall of Wayne County, N. Y., telling how water was rapidly pumped into the spraying tank. This thing of rapid tank filling is one of the big problems in successful spraying. With the wind and the weather tricky, we often are held up just when the poison should go on the trees; it becomes vitally necessary to lose as little time as possible in filling the tank. Many a spraying job has been partly ruined by the long delays in obtaining water. In some cases 20% of the time is spent in pumping water by hand, or dipping it up in pails. An efficient job requires a prompt and rapid water-filling outfit. Mr. Cornwall told us how he had solved this problem by the use of an electric motor for raising the water. The two pictures at Figs. 324 and 325 show something of the way this works. The first one shows a powerful pump with the electric motor in place. This is put down into a brook or creek which could not be reached directly from the spraying tank. Happily in this case there is an electric current which can be wired down to the motor, so as to give the necessary power. Then when it is ready the power is applied, and the water is rapidly thrown up, as shown in the other picture, directly into the tank, saving more than half the time formerly spent in obtaining a water supply.

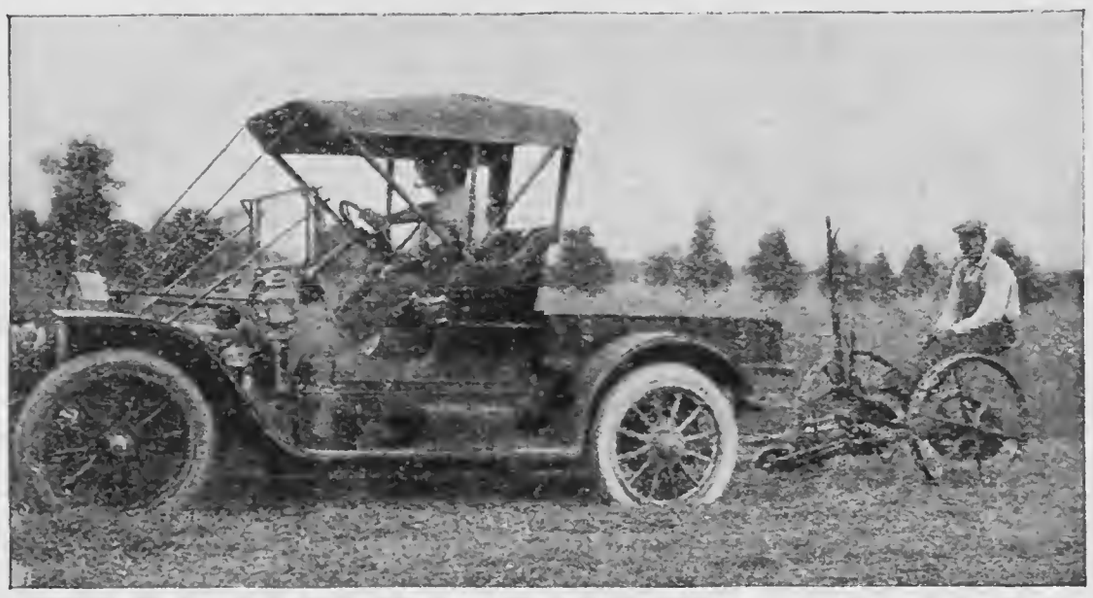
In another case, on a nearby farm the electric current is used to pump water up into a large tank. Then the sprayer is driven under the tank or below it, and the water rapidly runs in through a large pipe. We have seen half a dozen different devices rigged up by various farmers to meet the requirement of rapid tank filling, for everyone who has spraying to do realized the absolute importance of a quick, strong water supply. As has been said, the worm waits for no man. The weather is no respector of persons, and the wind pays no attention to the proprieties. As man is master of no one of these three things, it simply becomes necessary for him to become as efficient as possible in the few things over which he may obtain control, and the water supply is certainly one of these.

MOTOR CAR AND MOWER.

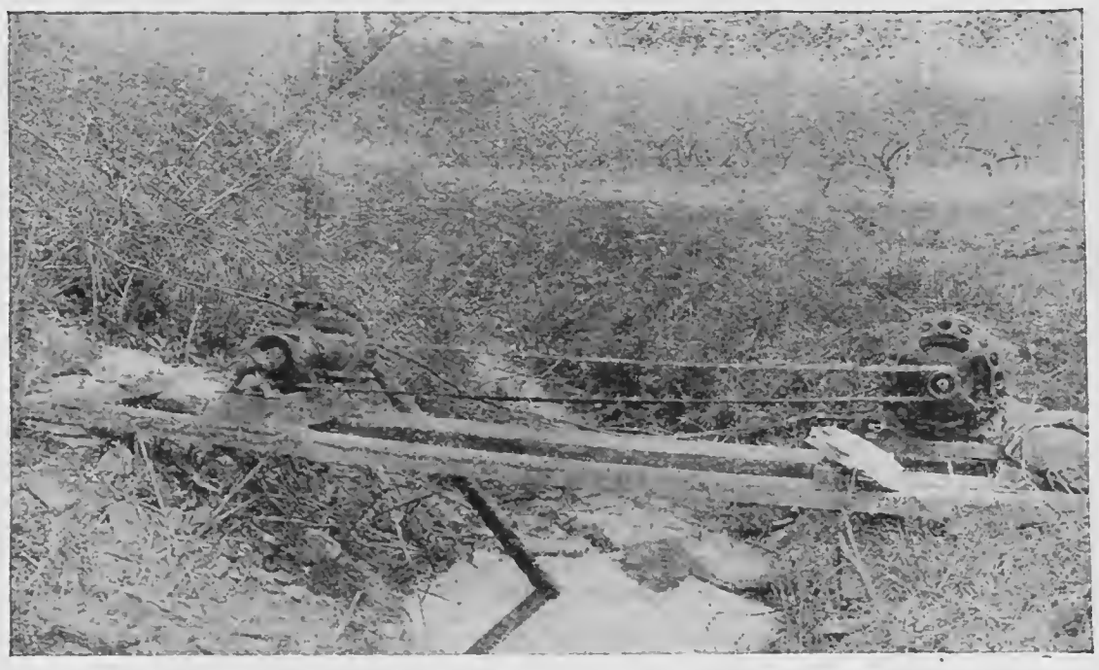
ONE of our readers driving along the road last year, saw across the field the outfit pictured at Fig. 323. He went close to it and took a picture. Here we have an ordinary driving car arranged so as to provide the motive power for the mowing machine. A short tongue is put on the mower and fastened so that the machine follows the car. One man sits on the machine to guide it properly, while the car is driven by a careful driver. With the mower knives kept sharp, this outfit travelled about one-third to a half faster than the average team of horses, and did excellent work, stopping neither for sun, nor to be watered or fed. As a rule, it requires a man of considerable mechanical skill to fit up an outfit of this sort so that it will work properly, and as a rule we do not advise the average man to tinker very much with an expensive car in his efforts to make it do more than carry matter swiftly about the country. Where a man has the skill, however, and enough knowledge of mechanics to fix the attachment properly, there is no doubt that the car can often be used for the lighter jobs at farm work.

AN EASTERN MAN IN NEBRASKA.

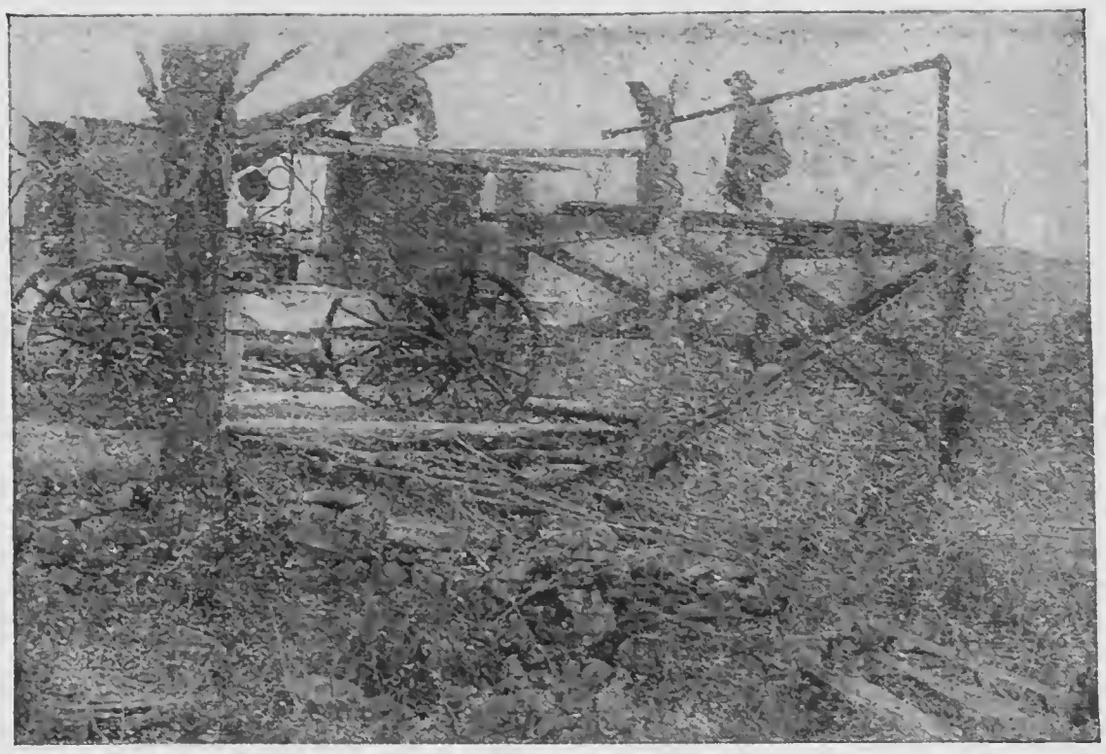
IN regard to stock—horses, cattle, sheep and hogs are sold at private sale, auction, to traders from the large markets, and to local traders, but the price is based on the South Omaha and St. Joe market, from which nearly every farmer who handles stock at all gets daily reports from his commission man, either by letter or by subscription paid by commission man to the market journals. On cattle, sheep and hogs the shipper gets the value set for the day by the big packers, less a commission of about $12 a car, and the business is fairly honestly conducted. One cannot sell except through a commission firm, but can buy from either the regular firms or speculators. There is on every load of feeder stock the selling commission, usually a speculator's profit, and usually a buying commission. I expect you are familiar with the process, but I will give my view of it. The horse sales are too crooked for a square pen, and are held in a ring, and jumping the bid by the auctioneer is so common as to excite no comment. Each horse is described and blemishes told as he is led in, but "a little rough about the hock" may mean a cripple from curb or spavin, and a little cut on the leg may mean a barb wire cut to the bone. However, they usually deliver the horses you buy and load them on the cars for you, so they compare favorably with the New York dealers as frequently described in THE R. N.-Y.



USING THE CAR ON THE MOWING MACHINE. FIG. 323.



PUMPING THE SPRAY WATER BY ELECTRIC POWER. FIG 324.



QUICKLY FILLING THE SPRAYING TANK. FIG 325.

This is more of a beef and grain than a dairy country, and most of the milk as such is sold direct to the consumer by the producer, who runs a retail route of his own with the usual overlapping, each man going all over town. The general farmers sell cream to the ice cream factory. I do not know the price. Others trade butter to the grocers at more than it is worth, 20 to 25 cents per pound, and it is barreled and sent to renovators. Eggs are sold to the grocers at 10 to 15 cents per dozen, occasionally as high as 25 cents in November and December. Poultry to dealers at three to four cents under Omaha wholesale per pound. There are a great many apples raised here, but mostly by general farmers, who neglected the orchards and sold the whole crop on the trees to buyers from the larger cities at a purely nominal price. The last few years have seen a great improvement in growing methods, and last year an association was formed which sold the crop from the sprayed orchards at from $1.50 to $2.50 per barrel F. O. B. Nebraska City, buyer furnishing one man in each packing crew to oversee and help pack. The association also buys spraying and barrel material, and is proving its value. The local market is well supplied with garden produce by nearby gardeners, many of whom peddle their own, while some sell to the stores. On this place of 500 acres I shall have 40 acres for truck and canning factory. The factory pays $7 per ton for sweet corn, 30 cents per bushel for tomatoes and $3 per ton for pumpkin. We have a man handling the garden produce, except for canning, on a commission of one-third the selling price, he doing all the gathering, preparing and delivering, but using our team and wagon. Bunch stuff brings 30 to 40 cents per dozen from the stores, and five cents retail. Tomatoes start at 10 cents per pound from stores and drop to 30 cents per bushel. Cabbage starts at four cents from stores and drops to nothing.

Sometimes we ship a little truck to Omaha, but the firms there do a wholesale as well as commission business, pay what they please, make returns when they get ready, with no control whatever, so the results are not always satisfactory. The staple crops here, are corn, wheat (Winter) and Alfalfa, with small amounts of Spring wheat, oats, prairie and Timothy hay. I am a town-raised factory hand from Massachusetts myself, but have had charge of large farms for the past 12 years, and this country is the best I have seen for the three staples above, and high-flavored long-keeping dessert apples such as Jonathan, Grimes Golden, and standard market apples, as Ben Davis, Winesap, York Imperial and Black Twig. C. E. DWYER.

Nebraska.

MANURE OWNERSHIP IN CONNECTICUT.

I THINK your answer to J. K., on page 691, as to manure, must be modified in Connecticut. I bought a farm here some years ago, and after the contract was signed, the seller raised the question about the manure. Thinking there was no doubt on the point, I offered to leave it to a well-known local lawyer, who said that in this State manure was personal property and could be removed by the seller of a farm. This settled my own case, but having been a lawyer, and being surprised that Connecticut should be in such a very small minority on the question, I took the trouble to look it up.

I found that about 75 years ago, if my memory serves me rightly, the highest court in the State had expressed an opinion that manure was personal property. This question was not involved in the decision of the case then before the court, and the expression of opinion is, therefore, known as a dictum, has no binding force on the court if the question should come before it again, and, technically, leaves the question still open in the State, as there has never been another case upon it. I say technically the question is open, since the highest court might, or might not follow the old dictum. Practically, however, lower tribunals would probably consider themselves bound to follow an expression of the opinion of the highest court, so that it would be necessary to carry a case to that court to secure any other decision. This would probably involve more expense than the value of the manure, so that we must be content to see Connecticut in a situation where, as you say, only New Jersey and North Carolina agree with her and where she gives encouragement to a bad principle of farming. The simplest way to change matters would be to get the Farmers' Club in the Legislature to get together and pass a law declaring manure made on a farm to be a part of the real estate, and to pass as such. A. F.

FARMERS' CLUB

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

PRINCIPLES OF SALESMANSHIP.

"I BELIEVE a neat well-painted wagon is an essential to success in huckstering, as a neat well-arranged store front is needed by the grocer to command trade," is the opinion of Jay Bates of Ashtabula County, Ohio. "If one is going in the business, he should see that his stock is clean, well arranged and is free from defects or injury," declares Mr. Bates. "The young man who engages in the business not only should possess a neat-looking wagon and team but should dress well himself. The clerk in the city grocery, should he be poorly dressed and should he be unkempt and uncleanly about his appearance would lose business for his store, and the huckster who goes about in his gardening garments would soon gravitate toward a low-class trade, and this would finally fizzle out. It is a principle of salesmanship that good appearance paves the way for good sales, will keep old customers and add new ones. I believe in wholesaling as much as possible. I have the town divided, and on one side of a certain railroad I

MAKE THE HUCKSTER'S WAGON NEAT.

wholesale, and on the other side, such goods as I may have left I retail. In this way I do not compete with the dealers who buy from me. It is as unethical for the huckster to sell in territory where he wholesales, as it is for a wholesale house to retail in territory in which it supplies local dealers." WALTER JACK.

Ohio.

Cement Wall.

How much gravel should be mixed with a bag of cement for a cellar wall, to fill the form with large rocks? How thick should the wall be to support a cottage on rocky soil? A. H. D.

Gray, Me.

A good proportion for such a wall is one part of cement, 2½ parts of sand and five parts of gravel or broken stone, these proportions being by measurement, or bulk. Sometimes bank gravel may be had, which contains sufficient sand to make it unnecessary to add this as a separate ingredient; in that case, use one part of cement to five of the natural sand-gravel mixture. Ten inches is a standard thickness for cellar walls, but eight inches would be ample in rocky soil and for a medium-sized house. By permitting the use of larger stones as filling, the wider wall might be more satisfactory than the narrower one. Such a wall should rest upon a footing course, or a layer of concrete six to eight inches thick and extending the same distance from the wall upon either side. M. B. D.

Filler for Homemade Fertilizer.

What can I use as a filler to keep home-mixed fertilizer from absorbing moisture and getting lumpy? Salts like nitrate of soda, ammonia sulphate and muriate of potash seem to make mixture this way. Would land plaster help? What do fertilizer companies use as a filler? J. H.

Glenarm, Md.

The experience of J. H. in having his fertilizer lump and harden after mixing is one of the disadvantages of home-mixing of fertilizer when only high-grade materials are used. However, this trouble is not confined alone to the home-mixed fertilizer—that sold on the market often does the same thing. Such materials as muriate of potash, kainit, nitrate of soda, calcium nitrate, etc., absorb water, and mixtures in which they occur are liable to harden upon standing for a few weeks. Fertilizer companies prevent this by properly combining water-absorbing materials with those that do not, but often they use some inert materials that will hold water and prevent caking. For this purpose there is perhaps nothing better than fine dry muck or peat. For the farmer there is perhaps nothing better than gypsum, fine dry sand, dry coal ashes, cinders, dry sawdust and even fine dry earth. Lime or wood ashes should never be used unless the farmer is sure he knows what he is doing. When a mixture contains considerable quantities of bone meal or cottonseed meal, no filler or drier will be needed.

Why Not Cover Crops?

Enclosed is a Hairy vetch plant which we grew for the first time on our farm last Winter, along with clover, rye and turnips. The plant sent is comparatively small, but shows a larger nodule than most of them. Some of the plants are above the knees at this date (May 10) and all are well filled with nodules. So far as we know, vetch has never been grown on this place before, neither has Crimson clover. The ground has not been inoculated; still a two-horse plow will not cover it without a chain. I will back you in your statement on page 698, as I believe mine will equal it.

May's Landing, N. J. T. W. K.

This vetch measures 18 inches from the ground to the tip. It was a vigorous plant, and the roots were well covered with nodules. Such a crop as this would without question take the place of five tons of stable manure, and in connection with the other crops will easily cover the Hope Farm man's claim of giving the value of 10 tons of good farm manure. There is no question about the value of such a crop when plowed under. It grows right on the spot, the roots work all through the ground, it adds no weed seeds to the soil, does not require hauling or spreading, enables a farmer to plow the ground earlier than he otherwise could, and gives him encouragement in half a dozen other ways. Thus it is strange that our Eastern farmers will ever permit a corn field, or a potato field, to remain bare through the Winter. The loss from leaching is so evident, and the gain from putting under the cover crop is so easy to see, that it seems astonishing that farmers will not adopt this simple plan of letting nature play the part of manure spreader and manure giver.

A Farm in Vermont.

THE R. N.-Y. has an article, on page 395, headed as above. Vermont is over one-half mountain; along the base of these high mountains run foot hills at an elevation of 500 to 1,000 feet. On these foot hills is good land for potatoes and grass, oats, buckwheat and clover, but above 500 feet elevation corn seldom gets ripe. The evergreen timber line is about 1,000 feet elevation, and above that cultivation stops because of the short Summer and the early and late frosts. Pastures run up to 2,000 feet elevation and are good perpetual pasture.

The valleys are about 100 to 200 feet elevation, and are very rich, warmer and productive, but narrow, and the land is worth $100 an acre, while the foot hills and mountain sides, when the timber is gone, are worth scarce $5 an acre. There are thousands of farms for sale for less than the house and barn are worth. These farms are cold sour land, all worn out and abandoned. Vermont is the best watered State—cool springs, mostly soft water, with pure air and scenery unsurpassed. But you should see a farm in Summer, when the crops are growing to see what it is. Apple orchards on our mountain sides are not a success. A. L. B.

So. Dorset, Vt.

May 30. Our nearest markets are Wilkes Barre and Scranton; following prices are what we farmers receive: Butter 35 at customers. Potatoes 85 to $1; apples 50 to $1.25; eggs 25 in Summer, 40 in Winter. Hay $15. Cattle $40 to $75. Chickens 14, live weight. Veal calves 8½ to 9; pork 9; horses $225 to $250, heavy draft horses. A. H. R.

Vernon, Pa.

May 29. Apples blooming generally full, although the crop was large in this section last year. Pears are the same or more so. Peaches, in this immediate vicinity generally show a good set, and hardly any blossoms seem to drop. Currants are looking very well. The recent very warm weather has broken the price of asparagus, which has kept up remarkably well, 12 cents being low, but it is now two or three cents below that. Cutworms appear to be less troublesome than during the last three or four years.

West Barrington, R. I. F. T. J.

May 23. Secretary Whately of the Virginia State Horticultural Society reports that the general prospect is for a large apple crop in Virginia. A heavy drop of some varieties is reported as now in progress in some localities heard from, and this may quite possibly be general. However, many reports say trees are so heavily loaded that thinning will be necessary unless a considerable number drop off. Condition of crop is generally good. Twig blight is reported from some districts, especially on Pippin and York Imperial trees. The export season is now just over. In the season 1913-14 there were 1,764,163 barrels exported, against 2,764,409 barrels in 1911-12, and 2,959,633 barrels in 1912-13.

May 16. Land is selling from $125 to $200 an acre; there was a small place sold for $250 per acre. Horses $125 to $200 apiece. I saw a team of brood mares sold at auction for $650. Beef cattle $6.25 to $6.75 per cwt. Calves 7½ cents per pound; milch cows $50 to $80. Cream around 26 cents per pound; dairy butter 23; eggs 17. Old hens about 12 cents a pound; hogs $7.25 to $7.75 per cwt. Apple trees did not bloom very full around here; cherries and plums bloomed very full. Strawberries shipped in selling at 15 cents per box. Hay $10 per ton. Corn 60 to 65 cents per bushel. Oats 35 to 40; potatoes, old, at $1.20. The corn is not all planted as yet; it has been cold and wet here. C. G. H.

Anamosa, Iowa.

COMING FARMERS' MEETINGS.

Pennsylvania State Horticultural Association, Summer meeting, State College, Pa., June 17-18.

Massachusetts State Board of Agriculture, Annual Summer Field Meeting, Hood Farm, Lowell Mass., June 24.

American Association of Nurserymen, Cleveland, Ohio, June 24-26.

Georgia State Horticultural Society, Summer meeting, Griffin, Ga., August 5-6.

Annual Poultrymen's convention, Massachusetts Agricultural College, Amherst, July 22-24.

National Dairy Show, Chicago, Ill., October 22-31. The following meetings and conventions will be held in connection with the show: American Association Creamery Butter Manufacturers, Oct. 26. Holstein-Friesian Association of America, Oct. 26. International Milk Dealers' Association, Oct. 26 and 27. Conference, Secretaries of State Dairymen's Associations, Oct. 27. Official Dairy Instructors' Association, Oct. 27. National Dairy Union, Oct. 28. American Dairy Farmers' Association, Oct. 28. Council of the National Dairy Show, Oct. 28. National Association of Creamery Managers and Owners, Oct. 28. American Jersey Cattle Club, Oct. 28. National Association of Ice Cream Manufacturers, Oct. 28, 29 and 30. International Association of Dairy and Milk Inspectors, Oct. 29. American Guernsey Cattle Club, Oct. 29. Congress of Marketing, Oct. 29. Milk Producers' Association, Oct. 30.

Annual show of the Paterson, N. J., Poultry, Pigeon and Pet Stock Association, November 18-21.

Indiana Apple Show, Tomlinson Hall, Indianapolis, Ind., November 18-24.

"I SEE you have announced me as the world-renowned orator," said the gifted speaker. "Yes," replied the chairman. "We had to do something to make you seem important. Nobody around here ever heard of you."—Washington Star.

"For the Land's Sake, use Bowker's Fertilizers; they enrich the earth and those who till it."—*Adv.*

Better Alfalfa

Ferguson's

NITROGEN BACTERIA

has produced wonderful results in strengthening alfalfa crops. It is no experiment but a proved success, as we can show you by the testimony of thousands of users. Plants must have Nitrogen. There is lots of it in the air, but too little in most soils. Ferguson's Bacteria gather Nitrogen from the air and store it on the roots of the plants. They store up such a quantity that the plants need only a part of it for food, and the balance is left in the soil to enrich it.

Alfalfa is not the only thing that should be inoculated with Ferguson's Bacteria. Used for Peas, Beans, Clover, Vetch, any legume, the results are wonderful in almost every case. The same bottle contains all the varieties of Bacteria necessary for the inoculation of any legume.

Saves the cost of fertilizers; Does better work

Quarter-acre quantity, 50c; 1 acre, $2; 5 acres, $9. Let us explain why you need Nitrogen Bacteria and why Ferguson's is best. Write for special booklet N—free.

Spraying Vegetables.

1. What are the best ingredients to mix together for spraying early tomatoes, for blight and bugs, and the number of pounds of each ingredient to 50 gallons of water? 2. I wish to spray my watermelons for blight, bugs and lice. Can you inform me what to mix for the purpose without destroying the vine? 3. I wish to put arsenate of lead on my sweet potato sprouts this year as I wish to plant them from the bed and spray by putting the arsenate of lead in a bucket of water, and dipping the tops of the sprouts into it as I pull them. How much arsenate of lead should I put to a bucket of water, or how much arsenate of lead should I use if I spray the sprouts before I pull them? F. A. S.

Clarksboro, N. J.

1. The best preparation for spraying early tomatoes for bugs and blight is Bordeaux mixture with arsenate of lead added. The Bordeaux is for the blight and the arsenate of lead for the bugs. A very good formula for making Bordeaux is to make up a 4-5-50 mixture; that is, four pounds of copper sulphate (bluestone) and five pounds of lime to 50 gallons of water. Place the copper sulphate in a cloth bag and suspend near the top of the water in a bucket or barrel, where it should dissolve in a few hours. Use good quicklime and slake slowly with a small quantity of water, dilute to 25 gallons and strain. Dilute the copper sulphate solution to 25 gallons and add together the two dilute solutions to make 50 gallons of the mixture. To this add three pounds arsenate of lead. Dissolve the arsenate of lead in a small pail first. It will then mix with the large quantity very readily. The standard formula for Bordeaux is 4-4-50, but it is safer to have more lime so as to take up all free copper, thus lessening danger from burning. We find, however, that the home mixing of spraying materials is quite a nuisance in a busy time and we prefer the commercial mixtures. There are a number of good makes. Whatever the brand it is best to follow directions on the containers in preparing these ready to mix materials, and there will very likely be little injury from burning. We use the same strength on tomatoes as is recommended for white potatoes.

2. The Bordeaux and arsenate of lead mixtures are about as good a spray as you can get for watermelons to be used for bugs and blight. It will not be effective for lice. We have never found anything for killing lice that would give satisfactory results. This year, however, we are going to try Black Leaf 40. This is a tobacco extract, made in Kentucky. I talked with a cantaloupe grower from Delaware last Summer and he was very successful in using it. I do not know just how it will do in our hands but we are going to try it on a small scale and see.

3. I believe you will get better results and save time by spraying your sweet potato sprouts in the bed before pulling. Arsenate of lead used at the rate of three pounds to 50 gallons of water will be about right. In dipping plants you are very apt to get some of the mixture on the roots, and burning is much more likely to occur that way than if plants were sprayed. TRUCKER, JR.

SAVE ONE-HALF ON ROOFING

Buy direct from our factory and keep three profits in your own pocket—save all middleman expense. At the same time, get a better roofing—made from the best of long-fibre, soft wool felt—every fibre thoroughly saturated with asphalt—roofing that will not dry out, crack, decay or rot.

WEARTEX ROOFING
Wears 10% Longer

We guarantee Webco Weartex Roofing to wear at least 10% longer than any other roofing of a corresponding ply, irrespective of price or construction and no matter what the term of years may be.

That is an unqualified guarantee of absolute satisfaction or money back. No matter where you live, you can take advantage of this great saving. There is no risk in buying from us because every article sold by us is guaranteed perfectly satisfactory or money back. We make all grades of roofing for all purposes at a wide range of prices—from 95c to $3.00 per Roll.

Send for this FREE Catalog

You owe it to yourself to read this roofing book carefully. It contains valuable information concerning all kinds of roofing materials—it tells you how to buy at a considerable saving and yet get a better roofing. Write for your copy today.

Reo the Fifth—$1,175 With Electric Starter and Complete Equipment
F. O. B. Lansing

The Car Men Don't Regret

For a little while, under normal conditions, almost any car performs well. It is time and strain that show the need for a well-built car.

Reo the Fifth is built for long, hard service. It is built by R. E. Olds, who for 27 years has been learning what cars must stand.

It is the car of extremes. Every part is given super-strength. Every driving part is one-half stronger than required by usual standards.

We spend six weeks on each car. All the steel is made to formula. We apply to each vital part the most radical tests.

We have for years kept test cars on the road. They are run night and day at high speed, up to 10,000 miles. And we require all important parts to come through that test with slight evidence of wear.

We use 15 roller bearings—190 drop forgings. We grind parts to utter exactness. To prevent the harm of clashing gears, we use a very costly clutch.

By the usual standards this car could be built, in this modern plant, for one-fourth less than it costs us.

What You Get

But you get here the utmost in a car. You get freedom from trouble, repairs and high upkeep. You get a car built to run for years as well as it runs when new.

You get strength to stand strains. You get wondrous endurance. Such things are impossible in a lesser-built car.

Many thousands of men who have tried the others are this year buying Reo the Fifth.

Our New Price

This year's price is $220 lower than last year's—with electric starter. We have saved this by factory efficiency. Now every buyer in this class can afford this grade of car.

And this year we give you the new streamline body. We give you the best electric starter and lights. We give you dimming searchlights, deep upholstery, perfect finish, and many new ideas in equipment. And a turn of the hand does the gear shifting.

For your own sake, go to your nearest dealer and measure up this car.

Sold by a thousand dealers. Name of nearest on request. Also catalog.

LEGAL MATTERS.

Witness of Signature.

I am in partnership with a man who is a caretaker of an estate long since in disuse. He had a number of hens, a few incubators, brooders and so on, and I gave him one hundred dollars as a half interest. He gave me a receipt for it stating I owned half of his stock of poultry, incubators, etc. It was dated and signed by him and the place designated, the location of the plant, I mean, but it was witnessed by no one, just his signature. Is this legal? Can I withdraw at any time? The receipt does not state any duration. Is such an instrument necessary to be drawn by a notary, and would you advise me to have the receipt witnessed? F. L.

Long Island.

This seems to be legal if your partner made his statement of the terms full enough to cover your interest. You cannot withdraw at any time anymore than he can. An instrument such as this does not have to be drawn by a notary. It would be better for you to have the signature of your partner on the receipt witnessed as then you have a disinterested party to prove he signed the paper, but it is good of course without a witness. Anyone who knows his signature, however, can state that it is his signature.

M. D.

Dispute Over Division Fences.

I bought 100 acres of land here in Virginia in 1884, and in 1888 traded 70 acres of it. The division line was surveyed by county surveyor employed by the buyer, who afterward sold it, when it was surveyed by another county surveyor. It has since been twice sold, and the division line has always been accepted by all owners until now. The present owner has just had it surveyed and claims about 21 feet in width on main road. What can I do? He threatens me with suit to recover "his" property. Can he change the division line after 26 years' undisputed possession and all previous owners satisfied?"

Virginia. J. H. C.

If the description in the deed which you gave to your grantee was correct, and the description was correct after a second survey, there seems to be no chance whatsoever for the present owner to succeed in an action against you. It certainly would be poor policy to give up land after so long undisputed possession without fighting for it. It would be well to find out whether the mistake in the survey was made by the surveyor employed by the present owner or by the other two surveyors. If there was a mistake in their survey and the line fence was put in its present place through a mistake, there might be some chance for him to recover. Otherwise it does not appear how you would be liable for the mistakes of the surveyors nor why the present owner should come to you instead of to his grantor, who, if anyone, would be directly liable to the present owner.

M. D.

Points of Law.

The telephone company has a guy wire attached to an apple tree. Can I have it removed? The owner stated she did not give the company the right to attach wire to apple tree. She stated she was willing to have it removed, but did not want any trouble with telephone company. R. T. B.

New York.

If the telephone company attached their guy wire to the apple trees without authority, they are a continuing trespasser and the owner may remove the wire at any time without notice; but the best way would be for the owner to write to the company that she wished to have the wire removed, and that if it is not done by a certain date, she will have it removed herself.

Spraying Law in Ohio.

What is the law of Ohio as regards spraying fruit trees, and penalty where spraying is not done? G. S.

Waynesfield, O.

The law follows:

Be it enacted by the General Assembly of the State of Ohio:

Section 1: That sections 6441-1 and 6441-2 of the General Code be amended to read as follows:

Sec. 6441-1. Whoever being the owner or manager of an orchard, or of one or more fruit trees shall spray or cause to be sprayed said trees one or more times during the period from November first to May fifteenth with some suitable preparation for the destruction of the San José, oyster shell or scurvy scale.

Sec. 6441-2. Whoever knowingly violates this act shall be fined not less than five dollars nor more than one hundred dollars for each year such spraying is not performed. It shall be the duty of the prosecuting attorney of the county in which any violation of this act may occur or the attorney general upon the request of the State board of agriculture or its successors to prosecute all violations of this act.

Section 2. That said original sections 6441-1 and 6441-2 of the General Code be and the same is hereby repealed.

EVENTS OF THE WEEK.

DOMESTIC.—With seven dead, thousands of feet of railroad track washed out and many persons driven from their homes in the lowlands of Texas, the flood situation was more serious, May 28, than it has been at any time since last December. A dozen rivers in the State were on a rampage. Property loss in south and southwest Texas is very heavy. Mexicans at Brownsville and elsewhere along the Rio Grande have been forced out by the flood water of that stream.

The Interstate Commerce Commission announced, May 28, that it will undertake an inquiry into the financial relationship existing between the Baltimore and Ohio and the Cincinnati, Hamilton and Dayton Railway. In the Senate a resolution was introduced by Senator Norris of Nebraska calling upon the Attorney-General to advise the Senate whether or not the New York Central and Hudson River Railroad and its subsidiaries are in an unlawful combination in restraint of trade. The Norris resolution asks further, if the Attorney-General answers in the affirmative, why he has not proceeded against this system under the Sherman anti-trust law to enforce a dissolution.

The Canadian Pacific Railway steamer Empress of Ireland was sunk at 2.30 a. m., May 29, in the St. Lawrence River, 30 miles east of Father Point, after a collision with the collier Storstad. The Empress of Ireland, which was rammed amidships, sank within 14 minutes; the Storstad reached Quebec, though badly damaged. Only 452 of the 1,476 persons on the large steamer were saved. The almost immediate sinking of the big passenger steamship indicates that the collier must have torn half way through her, crushing the outer cabins and opening up and flooding the engine room immediately. There was practically no time to launch the boats which had not been crushed in the collision. Help was given by the Dominion steamship Eureka and the mail steamer Lady Evelyn, which were called by wireless during the few minutes before the steamer went down. There was a sudden fog at the time, due to great quantities of ice in the Gulf of St. Lawrence. The Empress of Ireland, which was one of the finest of the Canadina Pacific fleet, sailed from Quebec a few hours before the collision. The Storstad, a Norwegian vessel was engaged in carrying coal from Nova Scotia to Montreal and Quebec. Responsibility for the St. Lawrence disaster will not be fixed without a bitter controversy between the two ship commanders concerned and their partisans. Capt. Kendall of the Empress of Ireland blames Capt. Andersen of the Storstad and is accused by Andersen. Each is supported by his crew. A Government commission will take evidence regarding it. Off Father Point, at the scene of the disaster, launches are cruising and waiting for bodies to appear on the river's surface. It is likely that the hulk of the Empress of Ireland will be shattered by dynamite so that hundreds of corpses may be freed and $1,000,000 worth of silver bullion be salvaged.

FARM AND GARDEN.—The Department of Labor has requests for 85,000 men to go to Oklahoma, Kansas and Missouri to help harvest the wheat crops. Secretary Wilson received a telegram, May 28, from Labor Commissioner John T. Fitzpatrick of Missouri, saying that it will require 30,000 men to handle the wheat crop, that the early harvest will begin about June 15 and that should the drought continue the harvest will begin earlier. Wages from $2 to $3.50 a day, according to experience, class of work and condition, will be paid. Director W. I. O'Brien of the Kansas State Employment Bureau says that Kansas will need more than 40,000 men beginning June 15, and that wages will range upward from $2 a day and board. Oklahoma will need 15,000 men.

The Ohio Experiment Station, Wooster, will hold its next Wheatfield Meeting on Friday afternoon, June 19, to be followed with a meeting in the Opera House that evening, which will be addressed by Governor Cox and at which Professor Vivian will give an illustrated lecture describing his trip around the world.

The National Dairy Show will be held at Chicago, October 22-31. Monday, Oct. 26, is Holstein cattle day; Oct. 27 Ayrshire day; Oct. 28 Jersey cattle day; Oct. 29 Guernsey cattle day. The following special days are arranged for: Friday, Oct. 23rd, Grange Day; Saturday, Oct. 24th, County High School Pupils' Day; Monday, Oct. 26th, Women's Club Day; Tuesday, Oct. 27th, Railroad Dairy Dept. Men's Day; Wednesday, Oct. 28th, Milk Dealers' Day; Thursday, Oct. 29th, Milk Producers' Day; Friday, Oct. 30th, Ice Cream Manufacturers' Day; Saturday, Oct. 31st, School Children's Day.

In order to provide for the growing and selling, direct to farmers, of seed potatoes guaranteed to be purebred and free from disease, The American Florist states that the Houghton County Potato Growers' Association was organized in Michigan at the beginning of this year. The association will specialize at first in the Irish Cobbler as an early and the Sir Walter Raleigh as a medium late variety. The association provides for a system of inspection by committees composed of the county agent and two members from each of the four principal localities in the county. These committees, with the officers of the association, form the executive committee. There are no dues, but to defray the expenses of the association a fee of 5 cents is charged for each bushel of certified seed potatoes sold through its agency. The association aims to dispose of the seed potatoes among the farmers rather than to dealers.

The New York State Department of Agriculture has issued a warning against glanders or farcy, with the following order: 1. That all persons importing or bringing any equine from or through the States of New Jersey, Pennsylvania, Connecticut, Vermont or Massachusetts into the State of New York, shall notify the Commissioner of Agriculture of the State of New York in writing immediately upon the shipment of such animals into the State of New York, giving information as follows: (a) The point of shipment; (b) The route or routes over which said animal or animals are to come into the State; (c) The point of destination within the State; (d) The time or probable time of arrival of such animal or animals at place of destination within the State. 2. That the said animals so shipped, imported or brought in shall be held at such point of destination within the State, for inspection and examination by the said Commissioner of Agriculture or his duly authorized representative, at least 10 days from the time of arrival at such point of destination, unless sooner released by the Commissioner of Agriculture or his duly authorized representative.

The annual poultrymen's convention of the Massachusetts Agricultural College is to be held at Amherst, July 22, 23 and 24. One of the special features this year will be a series of large charts, drawings, photographs and descriptive matter representing the correct equipment and proper management of a small Massachusetts poultry farm in all its details. The grounds, the houses, the number of hens per acre and per man, and the details of care and management will be graphically and completely illustrated. In addition there will be as large and instructive an educational and commercial exhibit as possible. The program consists of three solid days of lectures and demonstrations by the best authorities in the country. Program in full will be issued about the middle of June and can be secured from the Director of The Extension Service, M. A. C., Amherst, Mass.

The Paterson, N. J., Poultry, Pigeon and Pet Stock Association will hold its annual show at the Ellison Street Auditorium Nov. 18-21. It is expected that there will be a horticultural display held with it. Following is a list of officers of the organization: G. W. Cisco, superintendent; Dr. G. Johnston, secretary-treasurer; Walter A. Schultz, president; Arthur W. Bishop, vice president; Wm. Horne, Assistant Secretary. Partial list of the judges includes W. H. Card, J. Harry Wolsieffer, Louis Paul Graham, H. J. Fiske, and James Glasgow.

Get Your Canadian Home From the Canadian Pacific

WE will make you a long time loan—you can move on the land at once—your Canadian farm will *make you independent* and

We Give You 20 Years to Pay

Rich Canadian land $11 to $30 per acre—*one twentieth down*, balance in 19 payments with interest at 6%. Long before final payment comes due your farm will have paid for itself.

We Lend You $2000

For Farm Improvements Only

No other security than the land. You are given twenty years to pay with interest at 6%. In case of approved land purchaser, we advance live stock to the value of $1,000 on a loan basis.

Or if you want a place already established, you will find one on our Ready-Made-Farm. All planned by our experts, and our service and advice is yours *free*.

This Great Offer Is Based On Good Land

Finest on earth for general mixed farming—irrigated and non-irrigated lands. Located on or near railway. The famous Canadian West has magnificent soil, good climate, churches, public schools, good markets, good hotels, unexcelled transportation—and 20 years to pay. Time is precious. Write today.

FOR SALE—Town lots in all growing towns. Ask for information on industrial and business openings.

EVERY STABLE FLOOR

and every silo, barn, garage, henhouse and piggery should be treated with Avenarius Carbolineum to protect woodwork against decay. 38 years demonstrated results prove that the natural life of timber can be doubled. Try it—note results.

A PERMANENT REMEDY

against lice and mites. One application per year rids your henhouse of those pests. Prevents scaly-legs, cholera and other diseases. Read Bulletin 33—Write for it to-day.
CARBOLINEUM WOOD PRESERVING CO., 181 Franklin Street, New York

"DEYO"

You need an engine NOW. Here's the **proof**:—This season's late most everywhere—plowing, seeding, corn planting, 3 weeks behind, a tremendous hay crop on top of you, bumper crops of rye and wheat following. It's a rush right through, and every last minute has got to count. We know how magnificently you can be helped out by a

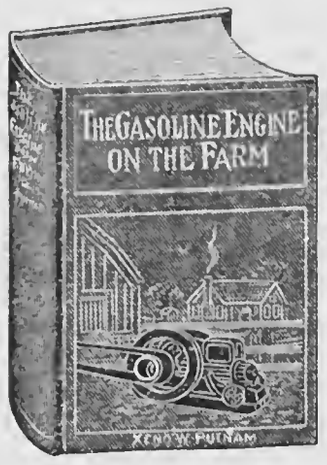
DEYO PORTABLE ENGINE
Has a Thousand Uses

You realize some of them—write us to-day, and let us tell you all of them—its faultless model, flawless construction, easy working, greatest power with least consumption of gasoline. Just give us acreage and class of farming—write to-day—we'll give you information of interest and value.

DEYO-MACEY SALES COMPANY
29 Washington St., Binghamton, N. Y.

Also Moneymaker Silo Fillers, Pumping Outfits, Pneumatic Water Systems, Feed Grinders, Saws, Pulleys, Belting, Shafting, etc. Write NOW for printed matter and information.

THE GASOLINE ENGINE ON THE FARM. Its operation, repair and uses. By Xeno W. Putnam.



This is the kind of a book every farmer will appreciate and every farm home ought to have. Includes selecting the most suitable engine for farm work, its most convenient and efficient installation, with chapters on troubles, their remedies, and how to avoid them. The care and management of the farm tractor in plowing, harrowing, harvesting and road grading are fully covered; also plain directions are given for handling the tractor on the road. 530 pages. Nearly 180 engravings.

This book will be sent to any address prepaid for

The Henyard.

Identifying Young Ducks.

How can one tell young (this year's) ducks and drakes from old ones? The breeds are Indian Runners and Pekin.
New York. R. S. B.

The bill of a young fawn and white Runner drake is yellow; of an old drake, greenish yellow. A young duck's bill is yellow, spotted with green; an old duck's dull cucumber green. These are the only general differences. In the case of Pekins there are no general differences by which one can distinguish all birds. The owner of a small flock might know the individual birds and thus distinguish them. Otherwise they should be kept in separate pens or wear leg bands.
W. H. HUSE.

Sour Milk for Chicks.

Much has been said about feeding sour milk to growing chicks. One of the pens entered in the laying contest by the Connecticut Agricultural College has made a remarkable record, and this pen has been fed on sour milk from their earliest chickhood. It is believed that a good deal of their success at the trap-nest has been due to this diet. In a recent news note Prof. Kirkpatrick, of the Connecticut College, makes the following statement about this feeding of sour milk.

"One commercial poultryman in the State who brooded 7,000 chickens last season has unofficially reported to the Station that he believed he developed his pullets a month earlier than in previous years by the use of sour milk. The plan of using the milk is to allow it to thicken and put it before the chicks so that they can help themselves at all times. As a matter of fact the Station believes in the use of milk so thoroughly that all of its commercial chicks have their beaks dipped into the milk as they are taken from the incubator in order to be sure that they get started in life right."

We understand that a good many poultrymen throughout the country are coming to this same belief, and they are feeding the milk freely. In one case that we know of a poultry company is using a commercial bacteria or starter, which when put into milk sours it in just the right way to produce the desired effect upon hens.

Care of Litter.

A few weeks ago I saw a question in regard to the length of time litter should be used for poultry without being changed. My experience has been that some times it lasts much better than at others, and I have found that by using a garden rake, to pull the litter out from under the dropping boards and towards the south side of the houses it lasts much longer than when this is not done. I usually do this about every day or at least every other day, and I believe it pays well for the labor spent.
New York. C. A. CASTLE.

Eggs for Hatching.

As you are generally considered an oracle I would like you to inform me of a place where I can get eggs for hatching.
Oklahoma. J. D. T.

If we have any such reputation we would gladly shed it without delay. The oracles had the reputation of emitting wise remarks, but their wisdom was so complicated that no one could tell just what they meant. They needed one or more interpreters. THE R. N.-Y. does no bragging about its wisdom. We try to speak the thought of our readers in such language that anyone can tell what is meant. An oracle needs interpreters. We try to cut them out, and we can tell you where to get the eggs.

Dried Brewers' Grains for Poultry.

A. C. T. asks about dried brewers' grains for poultry. I have been using the following mixture for at least three months, and have as good results as when using a different mixture: 125 pounds dried brewers' grains, 125 pounds malt sprouts, 100 pounds hominy, 100 pounds gluten, five pounds salt. This really is my cow feed, but I use 100 pounds of this mixture and 100 pounds wheat middlings, to which I add 20 pounds beef scrap, and keep before the hens continually. Dried brewers' grains are cheaper than wheat bran, higher in protein, and help to lighten up a heavy feed, as M. B. D. says. I also feed them to my horses in place of bran with ground corn and rye. H. E.
New Paltz, N. Y.

White Leghorns as Sitters.

Many persons think Leghorns will not sit or will not make good sitters and good mothers. We find this a very mistaken notion if they are handled in the following manner. We leave the hens wanting to sit on the nests until the second or third night, and choose only those which show the most gentleness and quietness when handled. At night remove each hen to a separate coop or large box, in which we have prepared a new nest, and then place hen on one or more nest eggs. Have this coop or box tight to keep her in and darkened with old sacks or old carpet. Leave hens entirely alone the first day, putting feed by her at night or the next morning. Seven out of 10 hens will thus make good sitters, and eggs can safely be put under them the second or third day. Feed in coops and never let hens out until the chicks are hatched. W. H. M.
California.

R. N.-Y.—Most Leghorn breeders prefer hens that do not want to sit. At the Australian egg contest the sitting Leghorn is regarded as a nuisance and breeders are advised not to use them in breeding pens.

Inbreeding.

I raised a beautiful pen of White Orpingtons last Summer, eight pullets and one cockerel, all vigorous and well developed birds, but I do not want to use their eggs for hatching this Spring, as the cockerel is a direct brother to the pullets. The pullets have been laying heavily all Winter. My intentions are to get a setting of eggs from some other fancier with good stock and raise a cockerel to use with these eight when they are coming two years; then I think I shall get results. I have refused to sell or use myself, any eggs this year for hatching. Under these circumstances am I right or wrong? W. S. P.
New York.

If these pullets have laid heavily all Winter, the chances are that the eggs may not prove very strongly fertile, and yet, they may. The fact that the cockeral is a brother to the pullets need not debar you from breeding from them if they are all well developed and vigorous. This, of course, is inbreeding, but inbreeding is not necessarily a mistaken practice, though if done indiscriminately it would probably lead to more rapid deterioration in a flock than indiscriminate out breeding. Any breeding, whether in or out breeding, should be done by selection, and if you select for size, vigor, type, and productivity, you need not fear to mate close relatives. M. B. D.

Hemorrhage of Oviduct.

I have lost about 40 hens, Leghorns. They seem to have difficulty in laying, which causes them to have a hemorrhage. It does not affect the Wyandottes. Any information as to the cause would be greatly appreciated. C. E. P.
Connecticut.

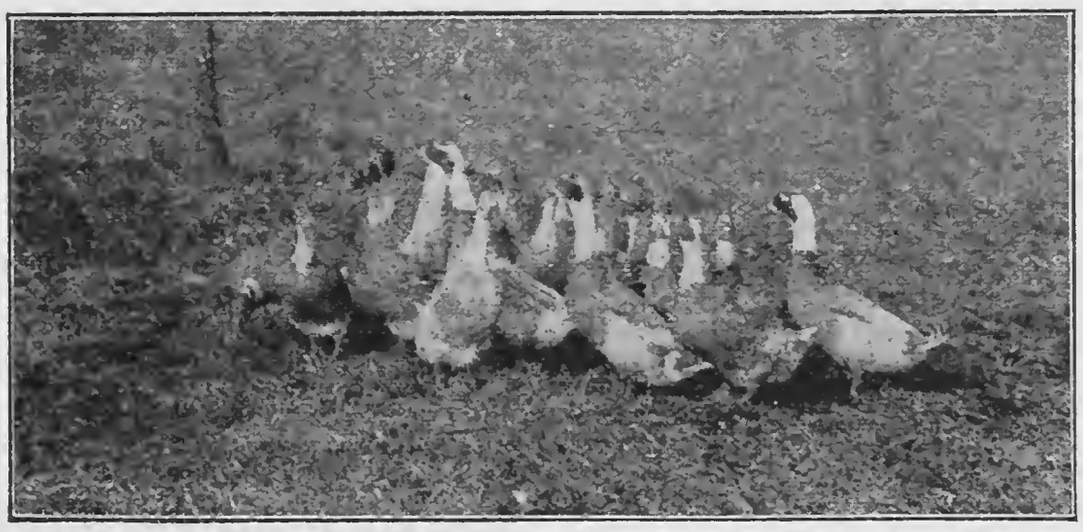
Hemorrhage from the oviduct is a symptom of inflammation of that organ supposed to be due to irritating food, condiments, overfeeding with heavy laying and lack of exercise and perhaps an inherited weakness which predisposes to trouble with that organ. I would suggest giving the flock as much range as possible and feeding an abundance of green stuff with little meat or other stimulating food. M. B. D.

Breeding Leghorns.

I am going to start some S. C. White Leghorns, and I want a good variety. I can purchase some good Leghorn eggs at $4 per hundred but they are not the Tom Barron strain. Would it be advisable to purchase these eggs and cross pullets with Tom Barron cockerels? Would that make the pullets the Tom Barron strain as they are counted the best strain? Would it be advisable for me to change the cockerels with the pullets as I thought that the cockerels and pullets would be related and that would be inbreeding. But would it change it if I got a thoroughbred Barron bird from a different party, still keep the strain, and inbreed? F. W. M.
Pennsylvania.

Your purebred—the word thoroughbred is applied only to horses—White Leghorns would not be the Tom Barron strain unless all the males and females in the flock were descended directly from his stock. By mating Barron cockerels with some other strain of purebred White Leghorns you would mix the strains while keeping the variety pure; in other words, you would have a mixed strain of purebred White Leghorns. You might get a very excellent flock in this way, but you could not call them the Barron strain since he would be responsible for only one-half the blood in the flock. After breeding them a few years you could call them your own strain, and maybe you could beat Mr. Barron at making them lay.

It is true that mating the cockerels and pullets of your own flock would be inbreeding, but that is not necessarily an unwise thing to do; probably Mr. Barron has inbred his fowls for a good many years. When you inbreed in this way, however, you should be careful to select only big, strong, healthy, and vigorous fowls of both sexes for your breeding pens. Carefully cull out all weak, inferior, specimens from your breeders and you can safely inbreed for years, perhaps as long as you keep hens. Getting a Barron cockerel from some other flock to mate with your Barron pullets would still be inbreeding, though not as closely. M. B. D.



A BUNCH OF INDIAN RUNNER DUCKS. FIG 326.

Horse Feed for Fowls.

Is horse feed good for dry mash for chickens? I used bran, oats and cornmeal. F. N.
New York.

A mixture of wheat bran, ground oats and cornmeal, while not especially adapted to the needs of hens or chickens, may be fed to them, of course, as they are all good poultry foods. For very young chicks the oat hulls might better be sifted out, and the addition of meat meal in the proportion of about one-eighth part by weight would improve the mixture. The fowls should also have mixed whole grain as part of their rations. M. B. D.

"THAT'S a terrible cough you've got, Murphy." "'Tis, sor; but, begorra"—with a glance at the churchyard—"bad as it is, there's thousands lying over the wall there would be glad of it."—New York Evening Post.

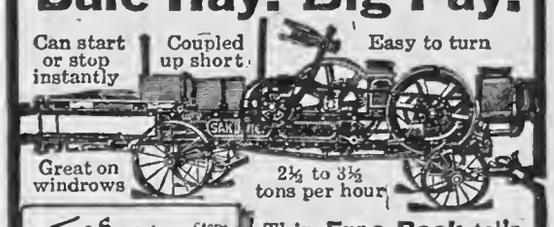
Bale Hay! Big Pay!



Tons Tell The Story of Profits
SANDWICH HAY PRESSES

This **Free Book** tells of profits baling hay. Sandwich owners lead all others: Make $200 to $300 clear profit every month baling hay for growers in their district. "32 tons in 8 hours with a 3-man crew" writes C. W. Brown, Merrill, Michigan. Plenty more bale 20 to 30 tons daily, rain or shine. **Big Tonnage.**

SANDWICH Hay Presses

This mighty, solid steel **MOTOR BALER** supplies its own power from high grade, hopper cooled, Gas Engine, 4, 6, 8 or 10 H. P. mounted on same truck. Geared Magneto. No break downs. Another exclusive feature—full power delivered to Press by heavy steel roller chain. Turns out solid, salable bales. No dangerous belts to slip or stretch in wet weather. No other baler has this friction clutch on press, can start or stop instantly. Simple self-feeder that stands hard crowding. We make Horse and Belt power presses too.

Grasp This Golden Moment

and mail a postal for our famous "Tons Tell" catalog that shows you in actual figures the money made with the Sandwich Press and how you can pay for your press from your first year's earnings. Sent **free** postpaid. Address today.

Hope Farm Notes

THE STORM.—People sometimes ask why we leave ridges along the sides of our hills and do not plow up and down the steep sides. Could they have been here on the afternoon of May 27 they would have needed no further argument. One of those flooding storms which now and then tear down our valley jumped out of the west and got to business at once. The day had been hot and sultry. We had been pushing all the week to finish the spraying. After dinner Mother and the girls drove to town to do some shopping. The little boys had a chance to go fishing. Up on the hill the power sprayer was puffing and coughing with Merrill, Philip and one of the Italians on the battery. Tom and Broker had hauled the big load up the hill and were trying to nibble rye as they pulled through the cover crops. Suddenly a strange darkness began to gather. It did not seem to be caused by gathering clouds, but somehow the light faded out. The air was still and deep mutterings of thunder were heard in the west. A stranger in these parts would hardly have expected more than a passing shower from these indications, but those of us who know the possibilities of this valley realized what was coming. It was no time for spraying, and no chance to get the machine back to the barn. They just unhitched the horses, put the hood over the engine and a quintette of horse and humarity made a charge for the barn. Before they reached it the storm *broke*. That is just what it did. Great floods of water seemed suddenly to be let loose. Almost before you could think it great streams of water appeared on the hillside. Suddenly the brook jumped out of its course and made a track across a plowed field, tearing and gouging as it went. In their little coop by the house, Redhead's baby chicks were dancing about, proud in the fact that they were past the danger period of babyhood. The flood whirled upon them and the little things were drowned! The leaves and fruit from the cherry trees went flying, and here and there a big limb twisted and split until it came crashing down. This lasted about two hours, then of a sudden the rain stopped, the clouds went blowing away before the wind and the sun smiled upon us once more.

GOOD AND BAD.—And it was a very wet spot of the earth that reflected the sun's smile. The soil was like a sponge. The rye was beaten down, and on every plowed strip there was a puddle, or a gulley. Had our hills not been covered with growing crops great holes would have been cut out, and some of the best soil carried down to the lower levels where we do not need it. The thick, matted rye held the flood back and the ridges along the tree rows spread it out so that it had no chance to form into little torrents and cut up the soil. The sprayer was all right. The next day a turn of the handle set it working. We had to go over the last few rows once more, but as a rule when the arsenate and lime-sulphur once dries on the leaves it is almost impossible to wash it off. On the whole our farm is better off for the storm. The rye was growing so rapidly that it was sucking too much moisture out of the ground around the trees. This soaker fills the soil once more. It will make heavier rye, easier plowing and better fruit.

BEHIND.—By Decoration Day we had not planted a kernel of field corn. Sweet corn was up, but we have been unable to get the ground ready for the flint. Spraying took a full week, including wind and storm, and we decided to fit the ground for mangels and carrots first. These roots are grown in a young orchard. A crop of rye standing nearly head high was plowed under. The soil is very sour, so we put on about 1,500 pounds of slaked lime per acre and worked it thoroughly in. Then the mangel seed is drilled in rows 2½ feet apart and fertilizer used along the drills. It is hard to describe just how such work is done. One horr's work at it is worth 10 pages of description.

It is like telling people how to plow rye under by hanging a chain on the plow. I have taken pictures of our outfit which I hope will show up properly. It seems like a sinful waste to many farmers when these great rye crops go right into the ground. Let any man come and see the rye and vetch we are turning under and see how the lime takes hold of it and he will quickly agree that such a crop equals eight to 10 tons of manure in its effect upon the soil. Of course I know that some of the experts say that rye is hardly worth considering as a manurial crop. They are welcome to their opinion—all I know is what rye has done for our soil, and I shall always seed it in every cover crop. On a grain farm rye might make trouble by mixing in with the wheat. It is such a hardy and tough crop that it will live under hard conditions, and sometimes after a hard Winter the farmer finds his wheat fields half full of rye. I am speaking of a fruit farm where it is necessary to keep the soil full of humus. In such situations rye is the backbone of manuring.

I know too, that most farmers would criticise our plan of plowing this rye under. Why not cut it to feed to stock or to sell as grain and straw? It is just a question of how you plan to run the farm. Selling the rye crop means immediate cash. Plowing it under with lime means that your trees, if you take care of them, will give this money back with interest in the future. It is an investment. I could probably sell our cover crops of rye and straw for $500 this year. My belief is that by plowing them under I can get three times that in the future out of the increased fruit crop and this year's corn crop. You must remember that this rye is a pretty cheap crop. Last August, while cultivating the corn for the last time, we scattered the rye, clover and turnips among the corn. The last cultivating of the corn worked the seed in. Nothing more has been done to it. Now it stands shoulder and head high. We put it under, use lime and plant corn again. Fertilizer is used in the hill, good culture given and next August in goes another cover crop. Under this treatment year after year we have seen our hard soil grow mellow and darker colored, our trees come into bearing, our corn crops increase and the rye crop start at waist high and improve until it stands over my head.

Do you think it would pay to hill up young peach trees to keep out the borers? Have you ever practised doing that in your orchards at Hope Farm? Would not the insect that lays the eggs lay it just above the mound of dirt? R. B. O.
Connecticut.

We mound up the peach trees in the Fall after digging out the borers. Coal ashes make a good mound. This gives protection from mice and helps with rabbits, and also protects the roots. At one time we left this mound around the tree during the Summer, but now we level down in Spring. This gives a better chance for culture, and we have found that in a drought the mound bakes like a brick around the trunk of the tree, leaving the bark tender and more likely to be injured. It is true that when the mound is left tight to the tree the borer insect lays her eggs above it. Often the mud cracks or works loose, so the insect can get down lower, and in any event the borer does great damage working down behind the mound. I should prefer to break the mound down in Spring, work around the tree, and paint or spray the trunk with a lime-sulphur wash. This will prevent some of the egg-laying. The borers that do hatch should be dug out.

Would it pay to grow State corn or not under these circumstances: We have 10 cows, and between 900 and 1,000 hens. We have always grown five and six acres of silo corn and put it in silo when mature. But it seems to me it might pay to grow State corn and husk it and feed the stalks in the Winter from the field to the cows, as we have engine and cutting box. After husking could it be put in silo, or would it be too dry to keep well? Would it pay more to have it put in silo because of lateness? H. S.
Union, N. Y.

This is a question which a man must settle for himself. We cure and husk the corn—not having any silo. This is because our stock consists mostly of horses and hens, neither one doing well in silage. We need the shelled corn most, so we grow a flint variety, husk off the ears, dry the stalks and feed them to horses and cows. If I had 10 cows to feed I should have a silo, yet with 1,000 hens I should try to save the grain bill. In such case, from our experience, we should plant a few acres of some variety like Eureka corn for the silo. On rich, well-manured soil, this corn gives a tremendous yield, and a few acres of it would fill a small silo. The quantity of silage is not so high, since the ears do not usually develop early, but it gives a great bulk of silo filling. The rest of the corn ground would be planted to some good flint variety, cut and husked in the usual way. I would not cut the dry stalks all into the silo, but would make a box or vat to hold a week's feeding. Cut this full and pour boiling water over it and then cover. It will steam and partly cook into a good "imitation silage" that is better than dry stalks cut into the regular silo. A little feeding molasses put in with it will lead the cows to eat it all up clean. Our plan for substituting for the silo is to grow a crop of mangels and carrots. With good culture on strong ground you can grow a large crop of these roots. They make a fine combination for feeding with dry stalks, and are better, I think, than silage, and are fine for the hens during the Winter. Few crops will respond to chicken manure better than mangels.

We have at times many eggs which have been incubated, and out of which the young chicks did not fully mature and hatch out. Would such eggs be any good as a fertilizer around young trees, shrubs, currants, raspberries and the like—say, take away four to six inches of soil, put around the tree or bush six to 10 eggs, smash them with a shovel and replace the soil? If this would work out all right it would not only get rid of the eggs, but help to fertilize at the same time. H. G. B.
Connecticut.

Such eggs contain lime and the elements of plant food. Here is a comparison between eggs and ordinary stable manure:

POUNDS IN 100.

	Nitrogen	Phos. Acid	Potash
Eggs.....	2.25	6½ oz.	2½ oz.
Stable manure.	8 oz.	4. oz.	10 oz.

Eight or 10 eggs will not give much plant food, but it will be available, and will make any currant or raspberry bush proceed to lay wood and fruit. If you could train the hen that laid the eggs to scratch around the bush without injuring it you would have a great combination. Seriously this is a good way to dispose of stale eggs. I have seen grown-up men go out with a basket of them and throw at a mark. If you could get wood ashes to use with the eggs you would have a good combination. H. W. C.

FARE: "B-Bedington Square, taxi." Driver: "Yes, sir—what number?" Fare: "I duuno—you'll find it on t' door!"—The Bystander.

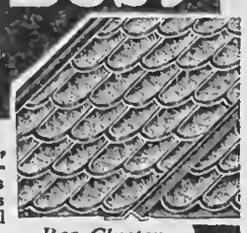
Lowest Prices Ever Made on World's Best Roofing



Lightning-proof, Fire-proof, Rust-proof, Rot-proof, Galvanized Steel Roofing Lasts as Long as Building Stands

Once you have purchased and laid Edwards Tightcote Galvanized Steel Roofing your roofing expense for that building is at an end.

Its cost per square is the lowest ever made. It has *no* up-keep cost.

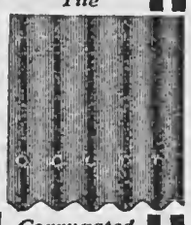
Always beautiful in appearance. Reducing cost of fire insurance.

Reo Cluster Steel Shingles

EDWARDS Exclusive Tightcote Process

Makes Rust-Proof Roofing. The zinc spelter becomes practically one piece with the steel. No ordinary galvanizing can compare with it. Each and every *Edwards Metal Shingle, Metal Spanish Tile,* each sheet of *Edwards Reo Steel Shingles, Grip Lock Roofing, Pressed Standing Seam* or *Roll Roofing, Ceiling, Siding, etc.,* is dipped in a *bath of molten zinc, one at a time after the metal has been stamped and resquared. The edges are galvanized* as heavily as the sides. Not the space of a pin-point on the steel is exposed to the weather.

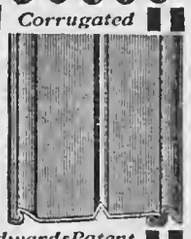
Spanish Metal Tile



How to Test Galvanizing

Take a piece of any other galvanized steel, bend it back and forth several times, hammering it down each time. You will then be able to flake off great scales of the galvanizing with your finger nail. Apply this test to a piece of *Edwards Tightcote Galvanized Steel Roofing*—you'll find no flaking—not a space on the metal the size of a pin point exposed to rust.

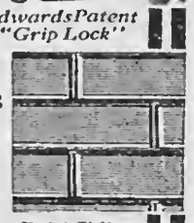
Corrugated



EDWARDS Patent Interlocking Device

Prevents Warping, Buckling or Breaking, Protects Nail Holes—They Can't Leak or Rust. Takes care of expansion and contraction, EDWARDS Roof never warps, buckles or breaks—nails are driven through the *under* layer not exposed to weather—cannot rust. No special tools or experience needed to lay EDWARDS Galvanized Steel Roofing; anyone can do the work—lay over old shingles if you wish.

Edwards Patent "Grip Lock"



Brick Siding

Reo Steel Shingles

Cost Less Outwear 3 Ordinary Roofs and are your joy and pride forever. No matter what kind of a building you have in mind there is a style of EDWARDS *Tightcote Galvanized Roofing* exactly suited to your needs.

Ceiling

FREIGHT PAID LOWEST FACTORY PRICES

Greatest roofing proposition ever made. Ask us to prove that we make lowest prices on world's best roofing. We sell direct to you and *save you all in-between dealers' profits.*

Ruralisms

Hardy Climbing Rose; Sowbugs.

WILL you tell me the best climbing rose, taking in consideration a foliage that will withstand insects and disease, also hardiness to endure the Winters of Central New York? I wish to cover a trellis which is a part of the ornamental work on a garage I am building, and it is desirable to have one that will not need spraying, and if there is such a rose, one that is hardy enough to withstand the Winters without laying down. 2. I am greatly troubled in my garden, especially in the hotbeds and cold frames, with sowbugs or wood lice and snails, eating the young seedlings as fast as they appear above the ground. I have tried stopping them with potatoes cut in two and hollowed out and laid among the seedlings, but with small results. If you know of any way to destroy them I should like to know of it. C. L. K.

Syracuse, N. Y.

1. It is hard to call any one the "best climbing rose"; there are so many worthy ones. In this case, however, where hardiness, vigor and free growth are desired, we can suggest two—Dorothy Perkins, and the Japanese Memorial rose, Rosa Wichuraiana. The first named is very hardy and robust, and produces an enormous profusion of double bright pink flowers, while Wichuraiana has single white flowers followed by an abundance of red heps; the foliage is persistent until late in the season, taking on a bronzy tint. Wichuraiana can be trained nicely over a trellis or arch, but in nature it loves to trail on the ground, where it roots freely, a habit which makes it very useful on rocky slopes. Of the two roses named, Dorothy Perkins is of course the more showy in flowers, while Wichuraiana has a little the more resistant foliage. Any rose, especially against a building, may at times suffer from mildew, but the Memorial rose is less liable to this than any other we know. Rose-hopper attacks may call for spraying, at times, but no rose is exempt from this.

2. A florist's cure for sowbugs is one part of Paris green to five parts of sugar. Mix thoroughly and then run it from a cone of stiff brown paper, having a small hole in the bottom, along the boards edging greenhouse benches. In the case of frames it would be wise to lay strips of wood in the beds, and run the poison along these. A florist says he has an occasional wholesale poisoning of these little crustaceans in his greenhouse, averaging about six sowbugs to every square inch of bench. Snail preventives are to scatter bits of camphor-gum about the plants, to strew a line of salt about the edges of the beds, and to dust lime about the plants. Toads and turtles are helpful pets to get rid of these marauders.

Lime Sulphur for Poison Ivy.

I HAVE always been poisoned very easily with poison ivy. I have been on fire with it from head to foot, and once my arms were swollen with it so that I could not raise my right hand to my face. In those days I tried every "cure" that I ever heard of, but all to no purpose, as I had just to wear it out and it generally took the whole season to do it. This year I got poisoned on the arm with it. I had made some lime-sulphur solution for spraying, and tried this on it; just coated the poison twice a day for two days (four applications), and the poison was "dead as a door nail." This remedy may not work on all but it is the only thing that I ever tried that did any good. C. W. D.

West Virginia.

R. N.-Y.—This is a new one. Lime-sulphur has been used for all sorts of things from dipping sheep to cleaning the cellar. When used with arsenate of lead it is about as near to being a "cure all" for trees as has yet been produced. Now, if it will relieve poison ivy, it becomes a benefactor indeed.

Pickle-worms on Cantaloupe.

CAN you tell what will prevent the destruction of my cantaloupes? For the last two or three years they have been infested with a worm light in color and from three-quarters to one inch long. Apparently this worm enters the cantaloupes and muskmelons just in the same manner the Codling-moth enters the apple. I cannot see how he enters the melons, but he makes a hole on coming out. Some of the melons do not show any signs of this worm until they are cut, then it is found to have been there and the melon is not fit to use.

Gunston, Va. W. S. F.

The "worm" is the larva of the Eudioptis hyalinata, a moth of a white color with a dark border on the outer edges of the front wings and part of the rear wings. The larvæ are somewhat over an inch long and are commonly known as "pickle worms," as they attack cucumbers as well as melons. Powdered white hellebore has been used for them successfully, but it is far less trouble to use arsenate of lead, one pound in 30 gallons of water, with some corn syrup to make it stick better. The insect is far more troublesome South than in the North, and in many parts of the South forbids the growing of melons unless kept down by arsenical spraying. The spraying will be more use if the poison is mixed with Bordeaux mixture, two pounds of lead arsenate to 30 gallons of the Bordeaux, and thus the leaf rust and blight of the foliage can be prevented while preventing the worms. The spraying must be begun early, for the worm enters the partially grown melons, and when the moths are seen flying around it is time to go to work. W. F. MASSEY.

Killing Weeds With Arsenate of Soda.

THE Hawaii Agricultural Experiment Station at Honolulu, under the charge of E. V. Wilcox, issues a bulletin on this subject. Experiments have been made with a number of weed-killing chemicals, but the best results were secured from this arsenite, which is usually prepared by boiling together common white arsenic and washing soda or sal soda. Theoretically these chemicals combine in such a proportion that if about 1½ pound of soda be used for each pound of white arsenic, the proper combination will take place to render all of the arsenic soluble by the formation of arsenite of soda. In practice a considerably larger proportion of soda has been used, up to four pounds per pound of white arsenic. It seems unnecessary, however, to use more than two pounds of soda per pound of white arsenic. In preparing arsenite of soda good results have been obtained from boiling a mixture of one pound white arsenic and two pounds sal soda per gallon of water for from 15 to 20 minutes. The exact length of time to continue the boiling can not be stated beforehand with any certainty but the boiling should be continued until the solution becomes clear. The clearing of the solution indicates that the proper chemical combination has taken place. In Australia, where arsenite of soda has been widely used for killing weeds, the common practice is to buy the arsenite of soda as such on the market, but in the spraying thus far done in Hawaii with arsenite of soda, it has been prepared by boiling white arsenic and sal soda as just described. The stock solution obtained by boiling together the sal soda and white arsenic is to be diluted before spraying with 15 to 24 parts of water, depending on the hardiness of the weeds to be destroyed. In Massachusetts it proved effective when used at the rate of one part to 66 parts of water. In Hawaii, the formula calling for two pounds crystal sal soda, one pound arsenic, boiled until clear in one gallon of water, and then diluted with 24 gallons of water, was applied at the rate of about 100 gallons to the acre. It is usually applied with a knapsack sprayer.

In spraying with arsenite of soda it should be remembered that the effect is produced by contact with the aerial portions of the plant. The spray should be applied in the form of a fine mist so as merely to cover the surface of the leaves and the stems. Care should be exercised not to drench the plants, since no more effect would be thus obtained, and the risk would be run of introducing too much arsenic into the soil. It should, of course, be remembered that the arsenite is poisonous and stock animals should not be allowed to browse upon sprayed vegetation until after sufficient rain has fallen to wash off what may remain on the foliage. As a rule the effect of the spray begins to be manifested within a few hours in the withering and browning in the leaves of sprayed plants. They are thus rendered unpalatable as feed for animals. The spray must remain in contact with the foliage for at least two hours, in order to have the desired effect. In applying arsenite, therefore, a clear day should be chosen, or at least one in which it is not likely to rain soon after the application of the spray.

Hellebore for Crow Poison.

MANY years since, an old farmer said, "Soak your corn in hellebore water. The crows would not touch it, and it would send the corn right up, green and strong, was worth a load of manure to the acre." I have tried it for 60 years and have never known it to fail. One of my fields is bounded on two sides by Spruce Glen, where thousands of crows roost in the Winter, and where many breed in Summer. When I plant this field with corn, I soak the seed in this water, and after planting never need to look at it again, for I know it is safe. The crows will sample it in a place or two, then leave for some other field, and will put a black mark on that piece for a Summer. It is called by some, crow poison, others, eleva, but its proper name is white hellebore, and one of the strongest poisons of our climate, though after many trials, I never knew a bird killed, nor one hurt by eating it. My way has been to put it in a large kettle on the kitchen stove, until its strength is exhausted. When cool, soak the seed a few hours before planting. It can then be dried a little so not to clog the planter, and the crop is insured. The hellebore grows near wet places along small brooks, it is often found by the side of skunks cabbage, of a much lighter green, runs higher, with smaller stalk. A pick is best to dig it, as it has many white rootlets spreading from a small bulb. If you have any seed left after planting, do not let the hens have it. My informant said, after his man had finished his piece, he emptied the contents of his bag to the hens and every one died. Try the hellebore. J. W. Y.

Meriden, Conn.

R. N.-Y.—The plant referred to is doubtless Veratrum viride, the false hellebore or American white hellebore, which is similar, by some considered identical, with the white hellebore of Europe, V. album. It is also called devil's bite, duckretter, wolfsbane, bear corn, Indian uncus, crow poison, and a host of other names. It has large plaited stemless leaves, and a large loose cluster of yellowish green flowers. It is extremely poisonous, some fatalities being reported from gathering the young leaves in early Spring, in mistake for marsh marigold greens. Animals do not relish the plant, the flavor being acrid and burning, but chickens have been poisoned by the seeds.

Pruning Cherries.

In respect to pruning cherries at fruiting, about 40 years ago a Royal Ann cherry died, and a number of sprouts came up from the stock which proved of quite good quality. Many times in picking we saw off the tops. The second year after we cut the tops off we get the finest cherries from these sprouts. If I were "R" I would try it on one or two trees and note results. As Oregon climate is a law unto itself one cannot know that it will work in other sections.

Oregon. S. T. W.

Protecting Manure from Flies.

You advise the use of acid phosphate on manure to keep flies away. Will Kentucky or Tennessee rock phosphate do, or must a more concentrated form be used? P. E. H.

Kentucky.

No—the ground phosphate rock will not serve the purpose as well as acid phosphate and kainit. Any dry dust would help somewhat, but the chemical action in the acid phosphate is the important part of the treatment.

Pruning Apple Trees.

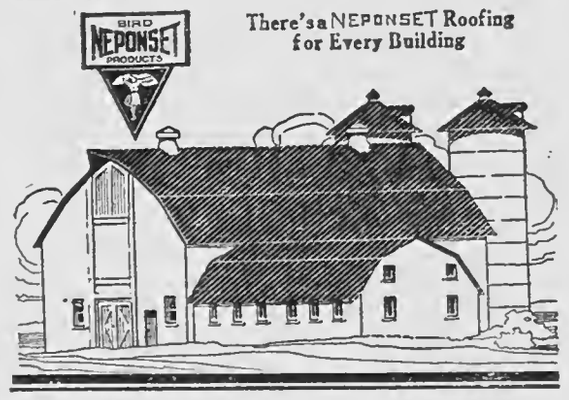
I have 200 Winter apple trees, Baldwin and Northern Spy, nine years old. Pruning the young trees in the future, what is the best time in the year? Should I trim the limbs back the year before to make them bear. S. H.

Armstrong Co., Pa.

The best time to prune would be about June 15 to 20. The effect of pruning at this time would be to induce a heavier setting of fruit, and to check wood growth. If the trees are neglected and need a heavy pruning it is best to extend the work over two or three years. Fall, Winter or Spring pruning has a tendency to promote wood growth at the expense of annual crops of fruit. R. B. G.

AUNTIE felt called upon to chide Annie for getting wet so often. One day mother and auntie were sitting by the dining table talking of Annie's still being out when it was beginning to rain. Just then they heard the kitchen door open softly. "Who has wet feet now?" called auntie. An ominous stillness for the space of three seconds, then a gruff voice replied: "The iceman."—Harper's Magazine.

When you write advertisers mention THE R. N.-Y. and you'll get a quick reply and a "square deal." See guarantee editorial page.



What protection will your roof afford eight, ten or fifteen years from now?

Most roofings look alike. Many are made to *sell*. A few to *wear*. If you let service—not salesmanship—sell you roofing, there's but one choice—NEPONSET ROOFING.

NEPONSET records like these: "One NEPONSET Roof ripped up after giving 8 years of the best kind of service and relaid a second time"; "NEPONSET Paroid now giving its 16th year of excellent service"; "not a single leak in 13 years," are due to just this—NEPONSET Roofing is "slowly made." This is why it is so slow to wear out. Dollar-for-dollar,

NEPONSET

PAROID ROOFING

gives best, longest and safest service.

THE BUSINESS FARMER'S PAPER

A National Weekly Journal for Country and Suburban Homes

Established 1850

Published weekly by the Rural Publishing Company, 333 West 30th Street, New York

HERBERT W. COLLINGWOOD, President and Editor.
JOHN J. DILLON, Treasurer and General Manager.
WM. F. DILLON, Secretary. MRS. E. T. ROYLE, Associate Editor.

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates 60 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

TEN WEEKS FOR 10 CENTS.

IN order to maintain the improvement and enlargements that we are now planning for THE R. N.-Y., we should have a circulation of 200,000 copies weekly. We must depend on our old friends for this increase. To make it easy for these friends to introduce the paper to other farmers who do not now take it we will send it 10 weeks for 10 cents for strictly introductory purposes. We will appreciate the interest of friends who help make up the needed increase of subscriptions.

*

THROUGHOUT Southern New York the past seven years have been much like the lean years in Egypt. One disastrous drought has followed another, bringing loss and trouble to the farms. This year starts in better—as if there would be moisture enough to start us back to the fat years once more. We hope so. It is high time, and the outlook is now good for it. A few wet seasons will work wonders on the New York hills. As one friend puts it:

I have lost my seeding twice on the same plot by sowing in the drought of the Fall, and am now trying Spring seeding. All my seeding of last year was killed by the drought, and meadows look hard; we have had a seven-year cycle of Summer droughts, just the time that I have been on the farm. Seven years of rain now would do more to boom farming in this section than all the agricultural banks that can be established.

And yet, there is no fair way of comparing the rainy season and the agricultural bank. One is the act of nature—the other the act or work of man. Neither nature nor man alone can be said to do most for humanity. In spite of wet seasons the hills of Southern New York declined as farm lands very largely because the farmers lacked capital to work their farms properly. The very blessings of the wet years to come cannot be properly utilized without some system of banking which will make the farm land a more convenient asset.

*

THE talk about a "war" with Mexico has about died out—killed by the evident feeling of the American people that there is nothing to fight about. Let no one think, however, that this means that our people are growing weak or cowardly. They have simply grasped the situation and realize that the suggested "war" was mainly a scheme of promoters and land grabbers to force Uncle Sam to handle their hot chestnuts from the fire. The following incident, related by a friend at Mobile, Ala., gives us a glimpse at the true National spirit:

Yesterday, Esau Frolichstein, the boy killed at Vera Cruz, was buried here with a regular military funeral. There was everything on the same scale as though he had been an officer, the greatest number of stores closed, even most of the moving picture shows stopped business. These facts are more significant when you get below the surface. Frolichstein in the first place was a Jew, his people were respected but poor and retiring, his father having run a little cigar factory and failing in that I understand is selling goods on the road; his aunts, or cousins, run a small millinery store, and probably just about make a living out of it. Taking it all together, he was in life a very inconspicuous individual, yet, in spite of the obscurity of his family, lack of influence, and the general but unjust prejudice against his nationality by the masses, he was honored to the full measure, the State sending the Governor and his staff, the army and the navy being represented, and all the city officials, besides each religious denomination having its official representatives, even the Confederate veterans attending officially. M. A. P.

In this we see one of the most hopeful indications of the times. This humble individual honored as a hero *because he was ready to serve his country*. Yet that honor is mingled with reserve and self-control, without revenge or hatred. We call that hopeful because it shows that our people are coming more to a calmer and reasonable view of public matters, and thus learning more of their power to control public men by controlling themselves.

HAY dealers in Virginia and other Southern States demand hay put up in small bales. Many of their customers buy in very small lots, and want bales which can be easily handled—say not over 90 to 100 pounds. The Dairy and Food Commissioner of Virginia has ordered that no damaged hay be sold in that State. This makes low grade or discolored hay very unsalable, and Virginia dealers will be forced to reject all shipments of poor hay.

*

THE only safe and sure way to sell a crop that we know of is to keep an accurate account of the cost of production. We may not be able to get it down to the last cent, but we ought to know at the end of the season about what the crop has cost per pound or bushel. Then we can tell whether the price at which we can sell is fair or not. As a rule we find that when we can command a price which gives us a fair or even a small profit over cost, it is better to sell rather than take the risk of farm storage. If for two years in succession the crop does not sell for more than it costs with ordinary production, it is time to produce something else. At any rate a fair idea of the cost of production is the essential factor.

*

"DO IT, OR GET OUT!"

THE latest public advocate of government ownership of railroads is Chas. H. Mellen, whose remarks about sheep and shareholders were quoted last week. Mr. Mellen ought to know. He drew $60,000 per year as a railroad president—$25,000 for railroad work and $35,000, we should judge, for "doing it" for men higher up.

A group of workmen were patching up the road. There was one honest man who knew that some of the material he was using was defective. He protested to the walking boss and received this ultimatum:

"Do it or get out!"

The man had a family and he knew the power of the boss. He "did it." Later this boss ran upon the man above him in construction work. There came another question about handling the job, and the ultimatum was the same. Then there came a man from headquarters who commanded the construction boss to do his work in a certain way. His words had a familiar sound:

"Do it or get out!"

At headquarters a question about bookkeeping arose. Great financial deals were going on and figures must be juggled to cover up the use of some of this money. Then there were men who controlled certain blocks of stock which were needed to elect convenient directors. Then there were directors who must be shown that it was to their interest to sit tight and do what they were told. We judge from Mr. Mellen's testimony that more than half the money he received as president was paid him for passing along the old, brutal command:

"Do it or get out!"

Then, apparently, there came a time when Mr. Mellen felt a heavy hand upon his own shoulder. His time had come for "doing it." J. P. Morgan pointed at the work he wanted done and gave the same old command. *"I was practically fired,"* says Mellen in his testimony. He certainly was not fired by any particular ambition to save the "sheep" among his shareholders. And finally Mr. Morgan himself faced the old command. What? The financial master? The railroad king? The man whose frown made millionaires tremble? Yes, at last there came one, stern, immovable, resistless, who said: *"I am death! I cannot be denied. You have had your chance to 'do it,' now 'get out!'"*

Mr. Mellen certainly ranks as an expert. We do not wonder that he favors government ownership. The history which he has opened up will convince thousands that if anyone is to issue the old command, *"Do it or get out,"* such power should lie with the American people.

*

WE have a case where a man made a small quantity of lime-sulphur mixture, used it on young fruit trees and injured them. He attributed the loss to the lime-sulphur and thus condemned it. Investigation showed that the mixing was done in an old tar barrel, and that the tar thus put on the trees was chiefly responsible for the damage. We know another man who, not content with using soluble oil as directed, added a large quantity of soft soap. The dregs from this mess injured several trees, and the oil was blamed for it. There is probably no manufacturer of standard farm products who could not tell a similar story. As a rule the people who do these things do not mean to be unfair, but they are not careful of their facts, and get them mixed up with experiments. The same thing is true of much of the work done by our experiment stations. We know of one case where a station man stated that a potash salt would benefit peach trees on light soil. He was right, but a man in the audience understood that one word *salt*, and claimed that the speaker stated that common salt would take the place of a complete fertilizer! This may be one reason why our scientific men are so cautious in stating their conclusions. There may be two safe methods—one to say as little as possible, the other to say enough to explain in full.

*

SOME years ago there appeared a book entitled, "The Fat of The Land." It was a very optimistic story of a back-to-the-lander who made a small fortune on a western farm. For a while this book was held up as a "model" by the people who intend to "show these old timers how to farm." Many a woman made life a burden to her husband by comparing his humble efforts at farming with the great success of this "fat" farmer. It developed later that the whole thing was a pleasant fiction. There was no farm at all. The author wrote the book to keep up his spirits while recovering from a hospital operation—carrying out in imagination some of the things he read in the farm papers. That was all there was to it, yet the author wrote some solid truths which could not be disputed. For example, he said that a poor man could start on a farm with two brood sows or two sitting hens, and by constantly laboring to produce the best pigs and the best hens in the country, make his farm famous and reach success. That is a great truth. A hen is a small unit in the animal world, yet she offers unlimited possibilities to an observant and patient man or boy. Let anyone start today with any breed which he really loves. Let him learn what a good hen is, and form his ideal, always selecting that kind of a hen. Before many years he will win in one of the egg-laying contests, and then nothing can stop his success. There will always remain this opportunity for the patient man with an ideal and the courage to work it out.

*

IT appears that some of the county agents are encouraging experiments with chemicals, lime, raw phosphate rock, etc., as against complete fertilizers. They also seek to test Alfalfa hay, Soy beans, etc., against mixed feeds. Some of the manufacturers object to this as interference with their business rights. One of them puts it this way:

"What would you say if these agents advised farmers to read the free bulletins or the other farm papers in place of THE R. N.-Y.?"

That is easy. We should say something like this: "Go ahead. The Lord bless you and give you the wisdom to select the farm literature which is of real service to you." If THE R. N.-Y cannot be made strong and interesting enough to hold its readers we have no right to complain. If it cannot stand fair comparison with the other farm papers it is our business to learn how to make it so that it can. If we cannot give a service different from that of the government bulletins we have no right to ask the government to call its bulletins off. We want no special privilege or government protection—only a fair chance to present our argument. As for those who have been selling goods to farmers as individuals we have long believed that a business revolution is coming. In the future more and more buying will be done through coöperative associations. This is a business-like proceeding and should be encouraged fairly by all friends of the farmer. We are opposed to the scheme of branding manufacturers as leeches or using unfair means to discredit them. Give them a fair chance, no more, no less.

BREVITIES.

To keep the hogs in first-class shape—put in a little patch of rape.

Now they are talking about raising "fur-bearing sheep." It is not likely that any man who has failed to grow the ordinary breeds of sheep will be likely to succeed with the "furs."

BOOTS and shoes have advanced 50 cents a pair in England. "Increased cost of raw materials" is the reason given. Let's see—the new tariff was to give cheaper shoe leather. Have *you* found it?

TALKING of irrigation, the Egyptian government has just awarded a contract for a pumping plant which will take every 24 hours 2,000,000,000 gallons of water from the Nile and force it where it may run over the land and water the crops.

THE skunk earns $3,000,000 each year for American trappers. These skunk skins are usually sent abroad and come back to us as "Alaska sable." Many a woman who would nearly faint away at the sight of a skunk would do quite the reverse when clothed in "Alaska sables" or "black marten."

Monroe County Drainage Demonstration.

RECOGNIZING that the drainage of low wet areas is one of the great farm problems of Western New York, county farm bureau manager Toan arranged for a demonstration of drainage machinery and methods at Webster, on May 23rd. More than 500 people, chiefly from the vicinity of Webster, but also from all parts of Western New York, attended this demonstration, which was on the whole very successful.

While the Farm Bureau arranged for the demonstration and was responsible for advertising and organizing it, it could not have been successfully carried out had it not been for the hearty coöperation of the local Grange and of Prof. E. O. Fippin of the State College of Agriculture at Cornell, together with the State Drainage Association. The local committee from the Farm Bureau and the Webster Grange deserve great credit for their work. The actual demonstration of drainage methods was in direct charge of Prof. Fippin, assisted by B. B. Robb and W. W. Warsaw, also of Cornell. The demonstration was made possible by the offer of the land for this purpose of Mr. Peet, on whose farm the demonstration was held. Both Mr. Peet and his son contributed very much to the success of the demonstration.

The Buckeye Traction Ditcher Company had a new machine in charge of their superintendent on the grounds. This machine dug a few rods of ditch in a very satisfactory manner, but because of the crowd and the wrong kind of buckets on the elevators, the demonstrator in charge declined to complete the ditch, much to the disappointment of many persons present, especially those who came late. A Cyclone ditcher was also on the ground. The motive power to operate this machine was supplied by a "Leader" gas tractor. While the tractor itself is apparently a very satisfactory machine for some kinds of work, it did not go well with the "Cyclone" ditcher, as the spread of the wheels was not right for straddling the ditch and because where it had to cross the ditch in turning at the ends it refilled part of it. The Cyclone did not, therefore, have a fair trial and some dissatisfaction was expressed with this.

The Du Pont Powder Company gave the best demonstration of the day, blowing up about 50 feet of underbrush in a strip three or four feet wide. It showed its adaptability for work in rough land and in opening ditches through woods.

There were six types of ditching plows on exhibition, most of which were drawn by horses to show what small tools could do in this line. In addition to this there were many kinds of hand ditching tools, supplied by the hardware company in Rochester. The Drainage Department of Cornell also had two or three different drainage levels on the ground, together with an exhibition of drain tile. Many questions were answered and a great deal of information was obtained by farmers on the various kinds of drainage machinery and methods which cannot fail to be of great value to the community and to this section of the State.

As far as interest was concerned, this occasion could not have been more successful. Between 90 and 100 automobiles were lined up on the road and in the lane near Mr. Peet's farmhouse. Some estimated the attendance as high as 600 people. Because of the fact that few of the demonstrators realized the interest in drainage, nor believed the prediction of Farm Bureau Manager Toan that he would have from 300 to 500 people present, the demonstrations were not altogether satisfactory. As a matter of fact a demonstration of this sort is probably more effective when a smaller number of people are present than when the crowd was as large as it was on Saturday at Webster. M. C. B.

Pheasants and New Game Law.

IN the correspondence with A. B. Katkameier published on page 747 Commissioner Huson is apparently in error. The Conservation Law as published by the Conservation Commission for 1913 says in Section 196, page 39: "The owners or occupants of inclosed or occupied farms and lands or a person duly authorized in writing by such owner or occupant may take except by use of ferrets in any manner at any time and in any number varying hares and cottontail rabbits which are injuring their property." If this means anything it permits the use of traps and makes it possible for any farmer to protect his young trees or nursery stock from rabbits. Rabbits almost never trouble trees until deep snow comes, and in a normal Winter they can be exterminated or so reduced in numbers as to be practically harmless long before that.

The case of the pheasant is somewhat different and more confusing. We have heard many reports of great damage to cornfields and apple orchards near the woods, but have seen none of it on our own land. The only pheasants whose stomach contents I have seen had been eating grasshoppers and marsh plants, with a few kernels of wheat left in the field after harvest. One had 30 or more large hoppers in the crop, besides those that had passed on. The law does not permit us to kill pheasants because they have been eating our crops, but the new law signed by the Governor about April first apparently makes it possible for the farmer to get some money out of them by going into the business of raising game birds, etc., either as a main crop or as a side issue. The farmer is apparently also better protected against trespassers, and it may be that many will find that the loss of a few hills of corn is repaid by the gain to be made from the birds.

I say these things are apparently so because the printed set of game laws for 1914 is not yet available and a reading of the new law in connection with the old sections may change the apparent meaning of some parts. ALFRED C. WEED.

Wayne County, N. Y.

New York State News.

CONVICTS AT WORK.—Convicts have already been set to work on some of the highways of the State. There are at this writing five convict squads on the roads and three of these are in Clinton County, two in Warren County. By the provisions of the new law convicts can be engaged in roadwork outside the former 30-mile radius from the prison where confined, so that now they may be employed in any part of the State. They are glad to get out of doors and are keen for the chance of work, and the results of their labors thus far are said to be satisfactory in the improvement of the highways. As there will be a large percentage of the roads of the State that will not be touched by the funds appropriated for the highways by the State, it is proposed to have the dirt roads worked by the convicts.

A LONG SERVICE.—A complimentary dinner was tendered George L. Flanders, counsel to the Department of Agriculture, by Commissioner Huson on the evening of June 1, on the completion of 30 years' service in that department. In 1884 the State Dairy Commission was organized; later it became the State Department of Agriculture. Mr. Flanders was connected with the Dairy Commission and for three decades has served the interests of agriculture in the State in connection with the Agricultural Department. About 30 guests assembled and a letter was read from Gov. Glynn of a congratulatory nature. The occasion was also the anniversary of 25 years in office of J. J. Caughlin, Deputy Commissioner in charge of the Buffalo office.

GRANGE MEETING.—The June meeting of the Columbia County Pomona Grange will be held at the Berkshire Industrial Farm, at Canaan, Columbia County on June 20. There will be addresses by Dean H. E. Cook of the Canton Agricultural school and John Sloan of the State Grange Purchasing Agency of Olean. The Berkshire Industrial School now has about 100 boys enrolled and is doing a fine work. There will be a large attendance and visitors will find an inspection of the farm, farm building and school most interesting.

THE HICKORY BARK BEETLE.—A bulletin from the State College of Forestry at Syracuse asserts that the hickory trees in the State are doomed as shade trees and from a commercial standpoint, unless active work is done to check the ravages of the hickory bark beetle. This small insect lives between the inner bark and the sap wood and cuts off the flow of sap to the upper part of the tree. Dr. M. W. Blackman of the college would be pleased to have reports on the work of the beetle in any part of the State and he will give suggestions on combating the pest.

THE CATERPILLAR PEST.—While all is being done that can be, in some sections of the State, in the attempt to carry out the order of Commissioner Huson to destroy the nests of the tent-caterpillar, the added spur of the law to this desirable end came a little too late, it is feared, to be of great avail. The Commissioner is reported as desiring to enlist the assistance of the State highway patrolmen in destroying the tent caterpillar webs along the State roads. Reports from sections in St. Lawrence County, particularly, are to the effect that the caterpillars are more numerous this year than ever and apple, maple and other trees are denuded of leaves. The worms hang in festoons from trees and pedestrians in village streets avoid passing under the trees so decorated, and in some of the worse infested sections the houses have been almost literally covered with the pests.

THE LABOR BUREAU.—On August 1 the new bureau of employment of the State Department of Labor will be put into operation. The principal office will be in New York and there will be two sub-offices, one in Brooklyn and one in Manhattan. There will also be branch bureaus in seven of the larger up-State cities. There will be one director who will act under the supervision of Commissioner Lynch and who will draw a salary of $4,000. Each branch office and sub-office will be in charge of a superintendent whose salary will be $2,000. Some of the things that the new bureau will undertake to accomplish will be to prevent the exploitation of labor, especially among the foreign born; the investigation of the causes of unemployment; the application of a remedy for the same; and the supervisions of private employment bureaus.

SUPPLYING FARM LABORERS.—The Onondaga Farm Bureau has been helping the farmers to secure laborers for the season and has placed about 40 on various farms in the county. It is said that about 200 men have called on the bureau for employment. A good hand gets about $30 a month and if married $35 to $40, has a tenement house without rent, firewood, milk and other things from the farm. The farm bureau will look after the matter of marketing farm products for its members with particular reference to milk for the city of Syracuse. It is possible that the question of public market facilities may have the attention of the committee in charge of marketing.

CROPS IN WESTERN NEW YORK.—The secretary of the Western New York Horticultural Society is quoted as saying that the reports on fruit crops that he has received from different sections of Western New York are to the effect that there will be a large apple crop, barring possible damage to it by storms or cold. The trees have bloomed heavily and progressive orchardists, as those of the apple country are known to be, have sprayed carefully so that insect injuries are not anticipated. Peaches will be a very light crop with best outlook in the vicinity of Lake Ontario which may have prevented some losses from the freeze. Cherries blossomed heavily and have set well. Pears and plums will be a good crop. Strawberries blossomed heavily and there will be a large crop. J. W. D.

Estimating the Apple Crop.

HOW shall we estimate a prospective apple crop? The members of the New York Fruit Growers' Association will soon be asked for their opinions. How do we know when we have an exact 100 per cent yield or an exact 50 or 40 per cent. yield? These questions may seem nonsensical, yet they are quite important. Of course it is, and must always be very much a matter of guesswork, but cannot there be evolved some more accurate or scientific way for basing an opinion on a growing fruit crop? I would like to see this matter freely discussed in THE R. N.-Y., and to know the ideas of fruit growers on this subject.

For myself, I wish to call a normal yield for an orchard or locality a full crop or 100 per cent.; anything above or below what I consider normal to be estimated as nearly as I may be able at over or under 100 per cent. There is rarely, or perhaps never a year when an orchard or group of orchards in a locality is producing a full crop on every tree. Such a condition, if it occurred, would clearly be regarded as an overflow crop and might properly be called a 200 per cent. crop. It is my belief that when we have what we call a normal crop, all varieties included, not many over 50 per cent. of the bearing trees are really producing fruit, owing to the habit that most varieties have of only bearing on alternate years.

Now for your opinions; are we to call such a 50-per cent. crop or 100 per cent. crop? For this season I estimate that 35 per cent of the apple trees of this locality were in full bloom and 20 per cent. more were in partial or scattered bloom. The conditions have been ideal; lots of moisture in the soil, lots of sunshine and warmth, fruit setting well and growth is very rapid. My own crop promises to be larger and finer than ever before. Trees in splendid health, and up to this date no aphis or other annoying insect. W. S. TEATOR.

Dutchess Co., N. Y.

Massachusetts Grange Activities.

THE lecturer of the Massachusetts State Grange, Mrs. Geo. S. Ladd, has announced a Bird Field Day for July 23, at the farm of J. H. Noble, Pittsfield, Mass. The State Audubon Society and the State Ornithologist will coöperate with the State Grange lecturer in the program for this meeting. All kinds of bird houses will be on exhibition and there will be, either at this meeting or one to be held in Worcester or possibly both, a Bird Pageant. Speakers for the day will tell many things about the birds that every member of the Grange, and others as well, should know. In July there will be held at the Massachusetts Agricultural College a New England lecturers' conference when it is expected that the National Lecturer, Geo. W. F. Gaunt of New Jersey, and Miss Jennie Buell, lecturer of Michigan State Grange, will be present. All subordinate and Pomona lecturers of New England will be invited to be at the conference, as well as the State lecturers from the New England States. The conference will be held on July 30; July 31 will be known as Homemakers' Day and August 1 will be a State Grange Field Day. On May 20 a Degree Rally took place at Faneuil Hall, Boston, when four States and 68 Granges were represented. Two degrees were exemplified by a men's degree staff of Waltham, Mass., and one by the ladies' degree staff of Shrewsbury Grange, comprising 51 people, all the degrees being illustrated by appropriate tableaux. The Subordinate Granges of Massachusetts are many of them entering heartily into the competition for prizes offered by the State Grange for best community service during the year. Much valuable, constructive work is being done this season by the Bay State Granges under the leadership of the efficient State lecturer. J. W. D.

National Grange Matters.

THE legislative committee of the National Grange spent a week in Washington recently going over the compromise Farm Credit bill presented by Congressman Bulkley. This bill is somewhat similar to the Bathrick measure in that it recognizes Government aid. The bill was reported favorably by the sub-committee and it is believed that there is a majority of the joint committee in favor of the measure. National Master Wilson says that the Grange is given the credit for killing the Moss-Fletcher bill through the active response made to the appeal to Granges throughout the country to support the Bathrick bill. The National Master will address field meetings in Colorado, Wyoming, Kentucky, Ohio, Delaware, Rhode Island, Maine, Missouri, besides looking after the work in his own State, Illinois. J. W. D.

Government Cotton Report.

THE condition, May 25, was 74.3 per cent. of normal, compared with 79.1 in 1913, and 78.9 in 1912. The average for 10 years past is 80.4. Percentages by States are as follows: Texas, 65; Oklahoma, 68; South Carolina 72; North Carolina, 76; Arkansas, 79; Georgia and Tennessee, 80; Florida and Louisiana, 82; Virginia, 83; Alabama, 85; Missouri, 86; Mississippi, 87. Drought has hindered the plant in the Carolinas and Florida and it has suffered from excessive rains in parts of Mississippi, Texas, Arkansas ad Oklahoma.

Foreign Crops.

Rains have improved the wheat crop in Germany and Roumania. In Hungary the wheat prospect is poor, but corn is starting well. Wheat sowing is rapidly progressing in Argentina and Australia. A five per cent. acreage increase is reported in the latter country. In India the outlook is generally favorable. In France wheat looks badly. The prospects in Italy are favorable, except in the southern part. Good rains in the lower Volga regions of Russia have improved conditions there.

Wheat is being cut in Southern Oklahoma, the crop being about 97 per cent.. Dry weather is needed for the harvest.

Spring wheat in North Dakota is a week to 10 days late. Soil conditions and weather favorable.

Clement & Curtis report Winter wheat condition 5.2 points under the Government report, indicating a yield of 622,312,000 bushels; Spring wheat 94.1; total wheat prospects, 877,000,000 bushels. Oat acreage, 98.9 per cent. of last year. Condition 85.5, indicating crop of 1,165,454,000 bushels.

The Nebraska June report gives Winter wheat conditions 98 per cent. of last year, and acreage 103 per cent. In Nemaha and Richardson Counties fly has done 30 to 50 per cent. damage, and a number of fields have been plowed up. Corn planting has been completed under favorable conditions, 40 per cent. being up. The area is a trifle less than last year.

Woman and the Home

From Day to Day

The Fatherland.

Where is the true man's fatherland?
  Is it where he by chance is born?
  Doth not the yearning spirit scorn
In such scant borders to be spanned?
Oh, yes! his fatherland must be
As the blue heaven wide and free!

Is it alone where freedom is,
  Where God is God and man is man?
  Doth he not claim a broader span
For the soul's love of home than this?
Oh, yes, his fatherland must be
As the blue heaven wide and free!

Where'er a human heart doth wear
  Joy's myrtle-wreath or sorrow's gyves,
  Where'er a human spirit strives
After a life more true and fair,
There is the true man's birthplace grand,
His is a world-wide fatherland!

Where'er a single slave doth pine,
  Where'er one man may help another,—
  Thank God for such a birthright, brother,—
That spot of earth is thine and mine!
There is the true man's birthplace grand,
His is a world-wide fatherland!

—James Russell Lowell.

*

LOBSTER sandwiches, which are savory and unusual, may be made from canned lobster where fresh sea food is not available. Mince the lobster fine, add half the quantity of shredded lettuce, a little chopped cucumber pickle, and enough mayonnaise dressing to moisten. Mix well, and spread between either white or brown bread, which should be buttered. Cut into small triangles.

*

HOUSEKEEPING on the great German steamer Vaterland, which recently made her first appearance in the harbor of New York, means catering for a family of about 5,000. Electricity is largely used in all sorts of kitchen work. There is an electric toaster, which makes 6,000 slices of toast a day. An electric machine whips cream; in about five minutes it can whip enough for 1,500 people. A row of kettles, electrically heated, boil the eggs, which are put in wire baskets attached to a complicated device, which registers the time required for cooking, and automatically lifts the eggs out at the proper time. A revolving meat-cutting machine cuts 82 slices of cold ham in a minute, while the bread-slicer cuts 64 slices a minute, all of uniform thinness. A whole kitchen is given over to making tea, coffee and chocolate. Of course the silverware is all polished by machinery, and the newest devices in vacuum cleaners are used. The first, second, third and steerage cabins have separate kitchens, cooks and stewards.

*

OLD-FASHIONED English housewives used to make a poultice of scraped potato to relieve pain from swollen bruises or burns. A doctor writing to the London Lancet recently endorsed this treatment in cases of gout, lumbago, rheumatism and bruises, especially in reducing swellings in cases of synovitis (inflammation of the membranes lining joints, as knee, ankle or wrist, or sheathing tendons). In acute cases the raw potato juice was made into a fomentation with hot water, and was found to give great relief. The actual medicinal agent of the potato juice seems unknown. We do not believe in substituting amateur dosing for trained medical care, in the case of any serious ailment, but there are many occasions in isolated homes where the home doctor is obliged to give first aid, and we are always rather pleased to learn that some of our home remedies have a sound basis for belief in them.

*

IN warring against flies the housekeeper must remember that care about the barn is not the only thing; she must do her part also. Her efforts must include proper care of all kitchen wastes. Such things as are intended for pigs or chickens must be kept in closed receptacles, while absolute waste, such as tea and coffee grounds, and other inedible or deleterious substances, should be burned or buried. On small suburban lots it is a common custom to make a shallow hole to receive vegetable wastes, each layer receiving a sprinkling of lime, and the hole being gradually filled with earth. This is a good plan, for it not only does away with the offense of the rotting, refuse, but also forms a useful compost. Wire garbage incinerators are made, which are simply like a tall upright basket of heavy wire, reënforced with iron hoops, and standing up several inches on iron feet; with a little kindling and, if need be, a little kerosene carefully used, garbage is quickly burned with the good draft provided, and it is much safer than a bonfire. Of course the cellar windows should be just as carefully screened as the rest of the house. It is an excellent plan to have a fruit and vegetable closet in the cellar enclosed in wire netting, raised from the floor, preferably on casters, and with netting shelves. This allows a free circulation of air, and if a tight-fitting door is kept closed there is no trouble from those exasperating little flies that are so troublesome with juicy fruits. Of course there should be a netted meat safe or cooling closet, which should be a valuable annex to the icebox. If ice is out of reach, some of the evaporating systems of cooling food will be desirable.

The Rural Patterns.

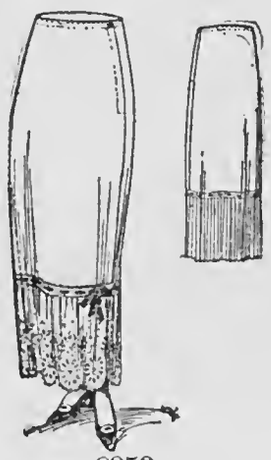
When ordering patterns always give number of pattern and measurements desired. Price of each pattern 10 cents.

7465, child's one-piece dress, 2 to 6 years; embroidery pattern 386 for scallops; embroidery pattern 652 for daisy spray. 8259, plain blouse, 34 to 44 bust. 7612, corset cover with straight upper edge, 34 to 42 bust. 8253, two-piece petticoat for misses and small women, 16 and 18 years.

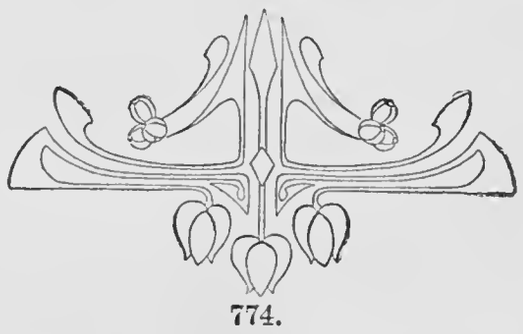
7465.

8259.

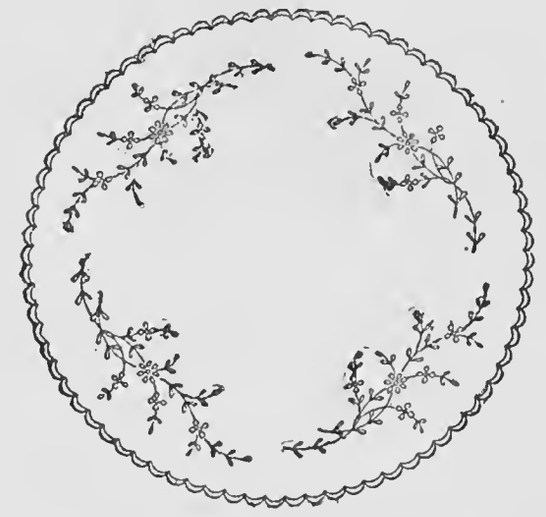
7612.



8253.



774.



684.

No. 774. Design for embroidering the ends of a table or dresser scarf. Two ends 12 inches wide are given. The design can all be worked solidly, all in outline or in a combination of solid work and outline; or the material can be tinted between the lines and the design outlined with a contrasting color. Stamped and tinted on art crash, 17x54 inches, with mercerized floss to work, 40 cents.

No. 684. A design for an embroidered center cloth twenty-two inches in diameter. One transfer is given. The scalloped edges are to be padded and buttonholed. The leaves and flowers can be worked solidly or as eyelets. The stems are to be outlined. Stamped on best white Scotch linen, with mercerized floss to work, 55 cents.

Graham-Flour Recipes.

GRAHAM Yeast Bread.—Take one quart of liquid yeast, three quarts of graham flour and one quart of white flour, salt and shortening, and two tablespoonfuls of brown sugar. Let rise once, then put in pans, raise, being careful not to get too light, as it will fall if you do. Bake about 45 minutes.

Graham Muffins.—One quart of sweet milk, one egg, one-half teaspoon salt, two teaspoons melted shortening, one tablespoon brown sugar, two tablespoons baking powder, graham flour to make stiff batter. Bake about 30 minutes in hot oven, in muffin rings.

Graham Wafers.—One-half cup butter or any prepared shortening, four tablespoons sugar, one well-beaten egg, one-half teaspoon salt, one teaspoon of soda dissolved in two tablespoons hot water, one-half cup sweet milk. Beat mixture thoroughly and then add as much graham flour as the mixture will hold, knead until it sticks together. Roll very thin and cut into wafers. Bake in a moderate oven until a golden brown and very crisp. Splendid for tea or school lunches.

Graham Pudding.—One pound dates, one cup nut meats, one cup sugar, one cup graham flour, one quart of water. Salt to taste. Boil 15 minutes. Serve cold with whipped cream. No one would suspect its humble origin.

Graham Cake.—Two cups buttermilk, two cups brown sugar, two tablespoons melted butter, two teaspoons soda, one teaspoon salt, one teaspoon each of cinnamon, cloves and nutmeg, one cup raisins, one egg, one cup white flour, graham flour to make a stiff batter.

MRS. F. C. G.

Cottage Cheese Variations.

PLAIN Cottage Cheese.—Take the clabbered milk and put it on the back of the range to heat and curd, taking care that the whey does not boil. Pour off the whey and put the curd in a sugar bag to drip.

Another method: Take the clabber and pour into it boiling water to curd the solid part of the clabber quickly. Cut several times with a knife and drain as above. Each method has its advocates. Mash the drained curd very soft and smooth with a silver spoon much as you would mash potatoes until all the lumps are gone. Add one tablespoon of thick sour cream to each pint of curd and three tablespoons of sweet cream, with salt and pepper to taste. Beat well till it is light and fluffy.

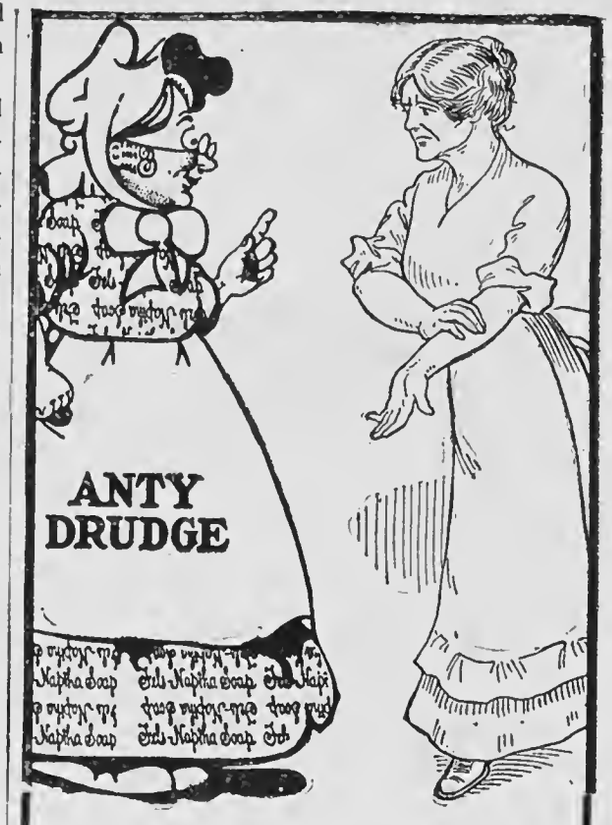
Cottage Cheese with Chives.—Make your cottage cheese as above and just before serving add to each cup of cheese two tablespoons of chives washed, drained and chopped fine. Mix well and serve at once.

Cottage Cheese with Sweet Peppers.—Make the cottage cheese as above and just before serving mix lightly into it long ribbons of red, yellow and green sweet pepper. A pair of kitchen shears will cut the peppers finer than an ordinary knife.

Cottage Cheese Salad.—Make the cheese in the usual way and form it into little balls or pats. Arrange individual small plates with ribbons of lettuce and on each green mound put a ball or pat of cheese. Over the top just before serving put a spoonful of golden mayonnaise.

Cottage Cheese Sandwiches.—Mix into each cup of cheese one cup of minced boiled ham and season to taste. Spread rather thickly on thin slices of buttered bread and cover with another slice. Good for hot evenings. HILDA RICHMOND.

A BLESSED companion is a book—a book that fitly chosen is a lifelong friend. —Douglas Jerrold.



Mrs. Caustic—"Yesterday Annie asked me if I believed any girl ever died for love, and I said, 'Yes, lots. They marry and then work themselves to death for their husbands.'"

Anty Drudge—"Well, they needn't. And I don't believe any woman does, any more, since Fels-Naptha Soap was made. It does the work and leaves women time for rest and pleasure."

Don't make yourself sick doing work the hard way when there's a better way to do the same work and it's easy.

Fels-Naptha Soap in cool or lukewarm water does the *hard* part of your work *for* you. Clothes are sweeter, cleaner and whiter in less than half the time, and don't have to be hard-rubbed nor boiled. And for washing dishes and all kinds of cleaning, it has no equal.

Fels-Naptha saves your strength. Buy it by the carton or box and follow the easy directions on the Red and Green Wrapper.

Fels & Co., Philadelphia.

FELS-NAPTHA

Seen in New York Shops.

JUST about the time some reformer decides that a certain fashion is ridiculous or immodest, and proceeds to denounce it, the intangible authority that decides our fashions moves on to something else. We still see references to slit skirts, but the skirts themselves have disappeared from the smart shops, and from up-to-date wearers. Extreme styles that are ugly or absurd rarely have any large following, except among those whose taste is for the bizarre and sensational. The next style to shock the conservative will doubtless be the pull-back bustle effect, which is foreshadowed by up-and-down fan-like ruffles on the back of some new gowns. However, the reign of this style is disputed by the long straight Cossack tunic, which is pretty and graceful. Some of the frilled "bustles" appearing look very much like the costume of the early eighties.

Sailor hats this season are rather narrow in the brim, and usually trimmed; the plain sailor is little worn except by young girls. A favorite style is of fine white straw, trimmed with flaring little black Mercury wings on each side, and a band of glossy black ribbon. Some of them are trimmed with patent leather bands and shiny black cherries. White chip hats with black trimming are very smart. A traveling sailor hat was covered with black and white checked cashmere, the under side of the brim being faced with black straw, while the only trimming was a black and white wing standing up in front. One very handsome hat seen was of white horsehair, with a square crown and narrow brim slightly rolled at the side; it was trimmed with six large black velvet flowers, like four-petaled roses, placed around the crown nearly at the top.

Rhubarb pink is one of the new colors seen in waists, and in fabrics for evening dresses. It is just the glowing tender shade of the young rhubarb stalks.

A separate skirt of white epouge had a flaring tunic longer at the back of plaid, the tunic fastened down the front with jade buttons. It was to be worn with white waists. Colored linen waists with white skirts are among the newer ideas; the linen is pink, bright red, jade green, blue or canary yellow, with flaring collar and cuffs of white. The effect, above a white skirt, is rather odd.

Fashionable baby clothes are simpler than ever in design, but are made expensive by beautiful hand sewing and fineness of material. A pretty model was fine batiste in the bishop shape, sleeves and skirt all in one. There was a little smocked yoke in both front and back, sleeves and neck were edged with narrow lace, real Valenciennes, and the little gown fastened in the back with two tiny pearl buttons. Smocking is used a good deal in babies' frocks, and also appears in the blouses and tunic skirts of their elders. Another fine little robe is trimmed with hand-made tucks, very fine featherstitching and French knots; the front is laid in fine tucks, with featherstitching and knots between, while the back had two box pleats, one on each side of the closing. The French knots are very pretty, but we do not like them on babies' frocks, for the knot might easily get into a place where it would cause discomfort to the tender flesh. We like the new babies' bands, made of fine silk and wool. They are like low-neck skirts, with straps over the shoulders, buttoned in the front.

Accordion, box and fine knife pleatings are used to make long tunics of thin materials. A gown of canary yellow crêpe de chine had both waist and tunic of half-inch box pleats, the narrow underskirt of the same material being entirely plain. A crush girdle of black glazed taffeta was finished with a large butterfly bow in front. Another gown was white crêpe de chine, the tunic half-inch knife pleats, and the underskirt Roman striped silk blue, pink and black predominating, the stripes going round, instead of up and down. The waist was a sort of kimono drapery of the striped silk over a blouse of the white crape, with a butterfly sash of the silk in the back. Some striped voiles made in a similar style were not pleated, but had the long tunic with the stripes going up and down, the underskirt with the stripes going around, and a loose kimono blouse. A wide girdle of suéde finished the dress; one in which the stripes were a soft shade of yellow had a belt of dull old blue, while another dress, with brown and fawn predominating, was belted with olive green.

In a Vermont Door-yard.

IT was early in the morning when an excited girl of twelve came rushing to me. "Oh! I just saw two birds flying and fighting! They were orange and black and yellow!" Her news was all exclamation points, and she was breathless, but her birds were not hard to guess, for an oriole had been calling and singing for days, about the house. Of course, she had seen two males quarreling.

This girl belongs to a Junior Audubon class, and is learning to be always on the watch for new birds. A few days ago, she had seen a tiny chebec (the least flycatcher) that another girl had found dead, so now she was interested in a bird of the same kind, that is continually after flying insects in our yard. As quick as a flash he is, and always hungry. He comes close to our windows, and does not mind our presence. He and his mate have pre-empted a maple in the middle of our lawn, and woe to the small bird that approaches it! Now, while the girl watched, one of these chebecs went to the maple, with a string in its beak, and after gathering it up a bit, flew up to the partially-made nest, in the upright forking branches, thus showing the girl how it is constructed. We gave some attention to the bluebirds that have a nest in a box made of old shingles, and attached to the side of the house, and suddenly the quarreling orioles dashed past us in a vivid flash of color. Later one of them sang. The bright and interested girl was learning a good deal. But there was still more to learn. A tiny bird with a short, notched tail, spoke from the Porter tree, and at once I was excited, for surely that was a voice that I knew, but had not heard for a year. We moved around, until we could see that the little fellow was all stripes, and by that, and the slightly fretful call, I knew it was a pine siskin, an irregular Winter visitor, now on his way to the far North for the Summer, having wintered south of us. The girl had a good look, and she will remember, and she will not forget that this is a cousin of the goldfinch that she had recently seen.

A robin was gathering dead grass by the billful, and taking it to a neighbor's maple. The girl had learned how a robin forms its nest of mud and grasses, so now she watched this one. Then she inquired if I had lately seen the robin with one foot. Sometime ago, a robin was seen hanging head-downward, suspended by a string tangled about the branch and its leg. When the neighbors had rescued it the leg was found to be broken off, held only by the skin, which was stripped from the bone in a dreadful way. This was cut and after some hours the bird was allowed to go, as it fought so hard to get out. It was seen to grow strong and able to provide for itself, in the following days, but we decided that if we put out strings for nesting birds, we would make them short.

There were more birds to see—the fearless little chipping sparrows, a goldfinch, and later, a yellow-throated vireo and a white-crowned sparrow, but the girl must go to school, so she hurried away, but her mates will hear what she learned in the door-yard, and they will want to see what she saw.

Our boys and girls are finding the study of birds extremely interesting. What a wholesome study it is! I wish all the children of the farms, villages and cities could be taught to see what there is to see of bird-life. There is no more innocent pleasure, and both chilren and birds would be benefited. E. F. M.

Cooking for Diabetics.

A. W. G. asks for recipes for diabetic cookery. I have a diabetic patient in the family, and have a list of foods prepared by a good physician. All kinds of meat (not liver) fish and eggs cooked in any way; gluten bread (but I make muffins and griddle cakes from the flour with baking powder and an egg). For vegetables, lettuce, celery, spinach, onions, cabbage and cauliflower, string beans; apples sour, oranges sour, and grapefruit; also all nuts but peanuts and chestnuts. He has tea and coffee weak, the cup half filled with hot milk. He has saccharin tablets for sweetening (there are several makes); one tablet will sweeten a cup of coffee. I make custards and coffee and lemon or orange jelly, with three or four tablets to a pint of milk or jelly, they dissolve quickly in the hot milk or liquid. Cocoanut can be added to the custard for a change. This diet is varied enough for anyone I think.

F. B. T.

I was on a diabetic diet for nearly a year. The order was to cut out starch and sugar, and at first it seemed as if that cut out nearly everything. At least I got quite thin and well.

I purchased a certain brand of gluten flour and made a "lazy biscuit": Two measuring cups of gluten flour; two tablespoonfuls lard; two teaspoonfuls baking powder; a little salt. Mix with milk or water; stir and put in pattypans. This amount makes eight nice biscuits.

I ate all the fruit I could and tried to follow the following:

MAY TAKE.

Soups or broths of beef, chicken, mutton, veal, oysters, clams, terrapin or turtle (not thickened with any farinaceous substances), beef tea.

Shell fish and all kinds of fish, fresh, salted, dried, pickled or otherwise preserved (no dressing containing flour).

Eggs in any way most acceptable.

Fat beef, mutton, ham or bacon, poultry, sweetbreads, calf's head, sausage, kidneys, pig's feet, tongue, tripe, game (all cooked free of flour, potatoes, bread or crackers).

Gluten porridge, gluten bread, gluten gems, gluten biscuits, gluten wafers, gluten griddle cakes, almond bread or cakes, bran bread or cakes.

String beans, spinach, beet-tops, chicory, kale, lettuce plain or dressed with oil and vinegar, cucumbers, onions, tomatoes, mushrooms, asparagus, oyster plant, celery, dandelions, cresses, radishes, pickles, olives.

Custards, jellies, creams (without sugar), walnuts, almonds, filberts, Brazil nuts, cocoanuts, pecans.

Tea or coffee (without sugar), pure water, peptonized milk.

MUST NOT TAKE.

Liver, sugars, sweets or starches of any kind, wheaten bread or biscuits, corn bread, oatmeal, barley, rice, rye bread, arrowroot, sago, macaroni, tapioca, vermicelli, potatoes, parsnips, beets, turnips, peas, carrots, melons, fruits, puddings, pastry, pies, ices, honey, jams, sweet or sparkling wines, cordials, cider, porter lager, chestnuts, peanuts.

I have read that an ideal treatment for diabetes is that of Dr. Guelpa of Paris. He advocates a three-day fast, accompanied by a bottle of Hunyadi Water each day of the fast. They say by the end of the third day, all signs of the disease have disappeared, in practically every case. MRS. L.

THE race is divided into two classes—those who go ahead and do something and those who sit still and inquire "Why wasn't it done the other way?"—Oliver Wendell Holmes.

Mix ½ cup sugar and ¼ cup butter. Add 1 beaten egg. Mix and sift 1½ cups flour and 2 teaspoons baking powder. Add alternately with ½ cup milk to first mixture. Bake 30 minutes.

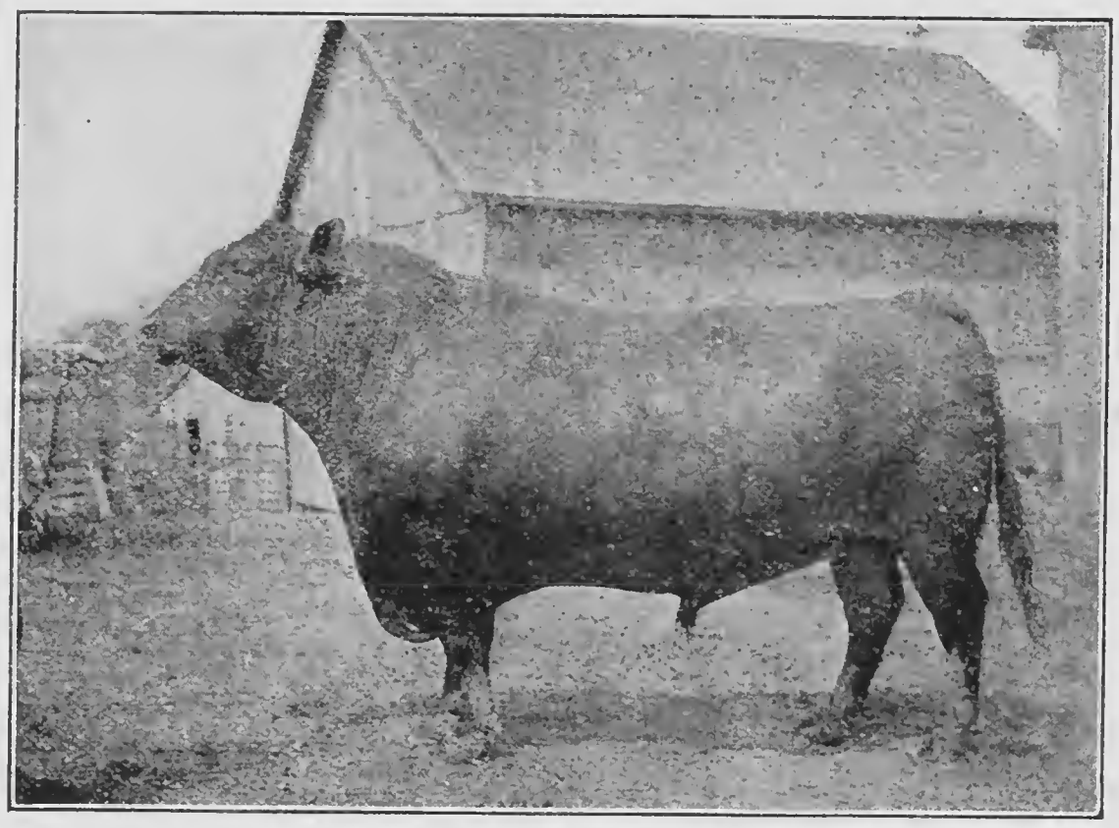
Live Stock and Dairy

BEEF CATTLE FOR THE EAST.

IT is quite surprising how many farmers in the Eastern States are considering the plan of breeding and raising beef cattle. Some of these men are dairymen who for one reason or another have concluded that beef might pay them better than milk or butter, so they are looking about and studying the beef question as best they can. We are not sure that such a change would pay and we should advise a man to be very careful before making a change from dairying. At the same time it is well to study the various beef breeds and get a fair idea as to their value. It is not entirely a matter of breeding beef calves and turning them out to pasture through the Summer and feeding them through the Winter, for there are about as many points to the business as there are in dairying, and no man can make a profit at beef raising unless he understands the



A HIGH-CLASS ANGUS. FIG. 328.

principles of feeding and knows how to handle the animals. One great drawback will be our long cold Winters which will mean a long continued season of barn feeding which would be expensive and make it difficult to compete under present conditions with the beef produced in the South and Southwest where the pasture season is longer. In some parts of New England, certain farmers are considering the plan of using the black Scotch cattle, either the Angus or Galloway, for crossing upon large native cows. The grades from this cross are usually large blocky animals not of much value for the dairy but of good shape and size for beef. They are very hardy and can be kept well in herds. Another value from this cross is found in the thick, black hide; now that the fur-bearing animals are diminishing in numbers, the hide of the black Scotch cattle has an increasing value and makes an excellent substitute for buffalo and the larger hides used for robes or coats. Thus a grade of the black Scotch animal has a double value both for beef and for its hides, and the chances are that the business of producing such cattle could be made to pay well with good management. Fig. 328 shows a high-class Angus bull. This animal was imported from Scotland and was used in the herd of Dr. H. N. Brown of Highland County, Ohio.

Raising an Orphan Foal.

WILL you tell how to feed a young colt in case the dam will not own it? Is there anything one can do to induce the dam to own the colt? I have a mare that had a colt two years ago, and would not own it. A. R.

When a mare does not own her foal, or if she proves vicious and will not let it suck, pen her in a corner of a box stall, by means of a gate or hurdle through the bars of which the foal can get at the udder. If necessary use a twitch a few times to keep the mare quiet while the foal sucks. She sometimes will own the foal when it has sucked a number of times. Do not retain such a mare for breeding. A foal may be raised on cows' milk, if one chooses milk poor in butterfat, but from a fresh cow. Dilute the milk with hot water. Mix with it two tablespoonfuls of limewater and two teaspoonfuls of granulated sugar per pint. Feed it blood warm. At first allow the foal a cupful once an hour; then gradually lengthen the feeding periods and increase the amount of milk allowed. Give the milk from a sterilized nursing bottle and rubber teat, or from a small teapot having the thumb of an old kid glove drawn over its spout and pierced with several holes by means of a darning needle. Give the foal free access to rolled oats in a box. When it eats oats well, add wheat bran gradually. In three or four weeks sweet skim-milk may form a part of the ration and then be gradually substituted for new milk. If the foal scours withhold milk and give warm water and limewater, sweetened, after a dose of two ounces of castor oil shaken up in milk. Give the foal a calf or other foal as companion, and soon let it run on new, clean grass, near the house, but not with adult stock. Better relegate the work of raising an orphan foal to some kindly woman. It is a tedious chore, and needs the motherly instinct and patience of a woman, who should be presented with the colt for her pains. A. S. A.

The "Eye Test" for Tuberculosis.

WHAT do you know about the eye test for tuberculosis? I tested my cow; she did not react. My neighbors tell me the test is not worth anything. Warren, Ohio. J. B. J.

There is no absolutely infallible test for tuberculosis in cattle, but those in which tuberculin is used are the most satisfactory and are sufficiently reliable for all practical purposes. The eye, or ophthalmic, test is a good one when properly made and when the condition which may vitiate it are guarded against. It is essential that reliable and properly prepared tuberculin be used and best that cattle being tested should be confined under shelter. Exposure to rain, bright sunlight, or strong winds that would irritate the eyes, or opportunity to wipe them off against hay or other substances might make it difficult to judge of the effect of the tuberculin. The method of using this test is to put one or two drops of tuberculin directly into the eye while someone holds the animal's head elevated and the eyelids apart. The reaction, if there is to be any, is usually apparent by the eighth hour, though it is sometimes delayed as long as 24 hours. It is shown by watering and reddening of the eye and by swelling of the lid; later "matter" forms at the inner angle of the eye, and may run down the face. Like all tuberculin tests, this one is most satisfactory when made by one whose experience enables him to judge of the certainty of the reaction and whether there may have been conditions present which could have interferred with it. The ophthalmic is the most simple of the tuberculin tests, and in the hands of the inexpert layman, probably the most satisfactory; it is questionable, however, whether it would be wise for an inexperienced owner to condemn a valuable cow on the strength of his own unaided observation of this test. M. B. D.

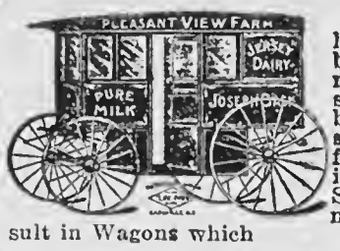
PARSONS "LOW-DOWN" MILK WAGONS



Are built of selected materials, by skilled workmen. Experts spend time, brains, money, searching for defects, hunting for improvements. Such methods in manufacture result in Wagons which

NEVER WEAR OUT

For these reasons Parson's "Low-down" Milk Wagons are popular. More popular still because of their "low-down" feature. Near to the ground, they are easy to jump into or out of. They're easy to load and unload. They won't overturn. Their cost is "low-down" too.

INFLUENCE OF SIRE.

ON page 682 in the article on making hogs pay, F. C. M. says the male decides the number of offspring. Science says, the female of all animals that bring forth their young alive, decide the number of offspring. W. M. P.
Silver Creek, N. Y.

W. M. P. has quoted only in part from my article relating to the influence of the sire. What I did say is as follows: "The most exacting care should be exercised in choosing the herd boar. He is by far the most important and influencing animal in the herd, for indirectly he stamps every pig farrowed. Upon his potency and ability to perpetuate fixed characteristics depends the number and type of pigs produced." It is understood, of course, that the boar is only one of the individual factors that influence prolificacy, but since the herd boar is usually mated with a large number of sows, he has a greater opportunity of exercising his influence, not only as regards type, but certainly as regards the number of brooded young. A further thought that should not be overlooked in the article was the point in reference to the direct influence of the male regarding the vitality and vigor of the pigs at farrowing time. While it is true that the male function is completed as soon as the sow is settled, there is no doubt but that inactivity on the part of the male during the mating season is largely responsible for weak litters lacking in uniformity and vitality. Prolificacy depends upon the forces of heredity of course, and for this reason not only the males but brood sows should be selected from large litters, not only in one generation, but in as many generations as is possible. It was not my intention to give the impression that the number of offspring depended entirely upon the male, but I do affirm that his influence in respect to this characteristic is greater than is usually appreciated. It should not be the aim of the breeder merely to increase in numbers, he should aim to increase in type by increasing utility value of the individuals. Profits with swine depend upon, first prolificacy, second, upon type and quality and third, upon the amount of home-grown feeds fed. It costs no more to grow a sow that will produce only three pigs than it does to maintain a brood sow that will produce 12 pigs, and one of the sure ways to get large litters is to select males whose ancestors were members of large families, ones masculine and resolute to transmit such prepotency in a marked degree. F. C. M.

BOSTON MARKETS.

THE supply and demand for green stuff in Boston market has been quite lively the past few days, and prices have been reasonable to both buyer and seller as the rule. Old potatoes are lower, as new ones are expected shortly, and many prefer to wait for these and buy the others only when obliged to. Maine stocks $1.50 to $1.60 per bag, the few new ones bring about $6 per barrel; sweets $4 per crate. Texas and other onions around $3 per crate. Rutabaga turnips $3 per bag for old stocks. New white $2 per dozen bunches. Old beets $2 per bushel; new 75 cents per dozen bunches. Carrots $1.50 per bushel; new $1 per dozen bunches; parsnips $1.50 per bushel; new radish 75 cents per bushel. Mushrooms 50 cents per pound; rhubarb one to 1½ cents per pound. Southern green peas about $3 per bushel; string beans, poor quality, $1.50 to $2 per basket. Cabbage 85 cents to $1.25 per crate. Cucumbers more plentiful and best bring only $4 per bushel; seconds $2.50 to $3.50 per box. Spinach and kale 60 cents per box. Lettuce still a little short, and sells at $1 and better per box. Celery from California $2 per dozen bunches. Southern Summer squash $1.50 and $1.75 per crate.

Hothouse tomatoes seem low at 20 cents per pound, but as the pickings at this late season are good in some cases, and only natural heat is required, they pay as well, or better, than some other things. Floridas about $3 per crate. Southern strawberries plentiful and cheap, but in most cases not good in quality. Maryland stock is now largely on the market, with Jerseys promised in a few days; 10 to 15 cents per box are the average prices; some sell lower. Nice pineapples plenty at $2.25 to $3 per crate. Oranges reasonable and in fair supply from California at $2.75 to $3.50 for navels and bloods. Foreign stocks range from $2.50 to $3.75, the few Floridas bring about $4. Lemons in big demand and prices range a little higher, $5, $6 and $7.50 per box being the figures. Grapefruit from Florida $4 per box, others $2.25 and $3. California cantaloupes $6 per large crate; cherries 25 cents per pound. Bananas $3 per bunch for best, others $2.50, $2 and $1.50 for yellow; reds $4.50, $3.50 and $2. The few native apples bring about $7 per barrel for Baldwins and $5 per barrel for Russets. Western box fruit $4 for Delicious. Winesaps $3 and a few others at $2.50. Butter receipts are fairly large, quality and color good and prices inclined upward. Packers are reported to be the largest buyers for storage to blend with their artificial produce, as a certain percentage so used reduces considerable on the government tax they pay, and also gives a better product. It is reported around 26 cents per pound is what is paid by these people, and as this price is considered rather high to pay by those who would buy for speculation only the latter class are in doubt just what course to take; that is, whether to buy now or take chances later. Cheese buyers are also holding off for about the same reasons, so that sales in that have been small. Wholesale butter prices for best creamery butter are up to 29 cents by tub; boxes and prints of the same class 29 and 30; good quality butter 25 to 28; poor quality as low as 18 in some cases. Prices in various cities throughout New England range from 25 to 30. Cheese of good quality ranges from 14 to 18. Eggs also rising and receipts declining, and will continue so for reasons of increased consumption in the country by city visitors, etc. Best quality fresh about 28, other grades 23 to 27.

Dressed poultry in just fair demand with fowls at 21; live fowls 17; live ducks about 15; good dressed turkeys 24 to 25.

Cattle at Brighton markets in light supply in about all classes, and sales as the rule satisfactory to sellers. Beef cattle cleaned up well; steers of good quality brought 7½ live weight. A few good cows brought 7, best bulls 5½, one for 8, cows in fair condition 4, 5 and 6 cents per pound. Good veals 6 to 10, with demand quite lively. Live hogs brought about 8½. Dressed hogs 11, supply short. One milch cow is reported to have brought near $140; others varied from around $100 down to $50. Horse market continues good on all good animals, especially the big ones, which if they suit the purchasers readily bring up to $450 each; others of lighter weight around $300, other classes $150 to $250.

Grain prices are held up by large holders and no hopes of much let-up for a few months yet. Meal at wholesale $1.49 to $1.60 per bag; oats range just under 50 cents per bushel; bran per ton about $27; hay $17 to $24 per ton. A. E. P.

"I DON'T want no rubbish, no fine sentiments, if you please," said the widow, when she was asked what kind of an epitaph she desired for her late husband's tombstones. "Let it be short and simple—something like this: "'Wm. Johnston, agged 75 years. The good die young.'"—Stray stories.

PIT OR UNDERGROUND SILOS.

SINCE mentioning those silos on page 680 a circular from the Arizona Experiment Station has come. Out in that hot and dry country the pit silo is advised, as they are not affected by the hot sun or scorching winds. The following description is given of the way such silos are made in Western Kansas. Of course this would not answer in humid sections where water stands near the surface:

The silo is constructed in the following manner: A circular trench five or six inches wide and eight to 16 feet inside diameter, depending on the size of the silo desired, is excavated to a depth of two or three feet with a very narrow long-handled spade. This ring is filled with strong concrete and allowed to harden; thus no forms are required. The center is then excavated and the pit dug plumb with the inside of the curb. After the excavation has been carried down about five feet the walls are cemented with a one or two-inch layer of cement mortar, 1:2, applied with a plasterer's trowel; a second five-foot section is then dug out and plastered. This is repeated until the proper depth is reached. This system of completing five-foot section as the pit is sunk does away with the need of scaffolding. The top ring should be carried up three or four feet above the general level with concrete or masonry and the ground sloped away from the pit so as to drain well. A roof is provided which also forms the support for the hoist. The hoisting is done by block and tackle and a horse, or, if more convenient, a hand windlass may be used. An overhead track leads from the silo along the line of feed racks so that the silage is handled only once, when loaded into the carrier in the silo. This carrier may be constructed so as to distribute the silage along the feed racks instead of dumping it in one place. Under no circumstances should a permanent ladder be constructed in a silo, since it will cause the silage to spoil. It will be found convenient to provide three moveable ladders of different length to use as the level of the silage goes down.

Before entering a pit silo be sure that it does not contain deadly gas. This is especially apt to occur during quiet weather. A candle or a scrap of burning paper may be used to test the pit; gas in quantity will dim or extinguish it.

A WYANDOTTE BREEDER TALKS.

ON page 724 you say the Standard type Wyandotte is a dumpy, sleepy, lazy-looking individual. You could hardly be farther from the truth. She is as dainty, as alert and as handsome a piece of hen flesh as is bred. You should look at some of the prize winners at New York. The first pullet at the Garden, January, 1913, seemed to me to be the nearest to standard type I have ever seen, and if there was a lazy feather on her, I didn't see it, and I spent a good bit looking at her. It is true the Wyandotte may not have the build of a racehorse, but like the truck horse, she can stand a lot of work. I for one don't want a bird to go at top speed for a little while and then have to be rubbed down and rested. Give me one that can work hard and steady for a long spell, and laying eggs is work for a hen, which you will have to admit.

If you had studied the birds at the first contest at Storrs, you would have seen that Mr. McConnell's pen, that did so well, one of his birds laying 247 eggs in 336 days, contained birds nearer to the standard type than any other pen of Wyandottes. The long backed birds were the poorest of all. Beulah Farms', the winners, five birds were all different shape. The Buff Orpington hen that made such a wonderful record had the single comb and whitish pink shanks of an Orpington, but that was all. She was nearer Wyandotte type than anything else. The breeder of the first pullet at the 1913 Palace show tells me she has been a splendid layer, and what is more, practically all her eggs are fertile and hatchable. One of my very best pullets, a prize winner, has layed steadily since last October and has not tried to sit yet. I think you will be very much disappointed when you see the New Standard for White Wyandottes, for they will not be changed to a "utility" type as Mr. Card says, he meaning I suppose, R. I. Red type, for he is a strong Red man, and of course they are the "only utility birds." About the only change is a change in the wording of the description of the back, from *short* to *moderately short*. I doubt very much if one will notice much difference in type in the show room, for there are very few very short-backed birds among the winners, most are moderately short now. That word short has been very much abused, some judges taking it to mean no back, the hackle and tail meeting. It has been this wrong interpretation which has made some people think the Standard Wyandotte was killed as an egg producer. True, some judges have required a no-back bird for the Standard said short, which can mean a lot.

I really don't think many who have bred White Wyandottes doubt that Mr. Barron's birds are purebred. Off-shaped birds will come from the best of matings. I haven't seen his birds as yet, but I venture to say that I have birds I know to be White Wyandottes, that are as far or farther from the Standard type than his, yet they of course are not to be compared with his as layers. Just because his birds have white lobes and R. I. Red backs, don't think for one minute that that is the "secret." It's Mr. Barron. The trouble is that most people, like myself, pay very little attention to type so long as a bird lays. I am anxious to see if all of Mr. Barron's birds are the same type, for I have a hunch that I shall find six or eight different ones.

Mr. Graham of Massachusetts said at Storrs two years ago that there was no reason why a roly-poly White Wyandotte should not be just as good layer as a long-backed one. The trouble is people have assumed they were not.

Why all this agitation over these White Wyandottes of Mr. Barron's as to their purity? Are they any farther from the Standard type than his Leghorns or many other birds in the contest? I think not. I have seen Leghorns of Mr. Barron's that were just as far off. I had the good fortune to hold birds for a judge when he was comparing them at a local show this past Winter and among the White Leghorn males was a Barron cock that was nearer Minorca shape than anything else. Also a Barron six-months-old pullet was coarser than any hen I ever saw, and no Leghorn shape. No one doubted that these birds were pure Leghorns. It is simply because everyone has gone daffy over Leghorns for eggs, and when any other breed shows them up, they are mongrels with Leghorn blood. There is no trouble with the Standard, or at least very little; it is with us, who don't pay enough attention to it. The breed doesn't make any difference, for the best one is the one you like the best. It is what a man can do with what he has. Don't worry about the type, but tell us how to make any type lay. It is much more important, for there is no one typical egg type, at least those that know it, never seem to be able to pick it out. Mr. Barron, when picking out the great layers at Storrs, didn't do it that way.

Connecticut. G. M. ALLERTON.

BUFFALO MARKETS.

THE markets are now full of home-grown lettuce, asparagus, green onions, radishes, all at low prices—lettuce, three heads for five cents, radishes at two bunches for five cents. The old crop of onions is still dear, best home-grown not quoted wholesale at less than $2.50 a bushel, but the green bunches are four for five cents. Asparagus in fine quality at five to seven cents a medium-sized bunch. Cabbage is still very high. Old beets, turnips and carrots have about disappeared, and as the new crop is not in to any great extent the prices are high. Retailers pay 25 cents up for new carrots and beets per dozen bunches. String beans are down to five cents a quart. There is still some supply of hot-house cucumbers at five cents each, and tomatoes at 15 cents for six. Strawberries are fairly plenty at 12 cents a quart, the quality being very good. The home strawberry crop is likely to be injured by lack of rain. Apples sell at $3.50 to $5.50 per barrel, wholesale, and 12 to 15 cents a measure of about six fine-looking western specimens. The promise is of a big new crop, but next to no home-grown peaches. Potatoes remain stationary at not over 85 cents wholesale, but retailers usually ask $1 a bushel. Butter is quoted strong, but not above 28 cents wholesale, and 29 to 32 cents to the consumer for best grades.

J. W. C.

May 19. Farmers are late in planting their crops, owing to so much wet weather. A few pieces of oats have been sown. There is no demand for cows on account of the low prices for dairy products. Butter brings only 23 and milk sold to a shipping station for $1.05 per cwt. Seed buckwheat $1 per bushel; oats 55; meal $1.45 per cwt.; eggs 20. P. S. S.

Mayville, N. Y.

Horses are selling for $125 to $200; cattle 7¾ cents; calves $25 to $30 each; hogs 7½ to 7¾ cents; sheep five to 5½; lambs $7.50 to $8.50 per head; wool 20 cents; butter 25; eggs 16; poultry and hens 13; roosters six; geese 10. Potatoes $1; wheat 88; rye 75; oats 40; corn 75; hay $15. This is a stock country, and rye, oats, corn and hay are shipped in, making prices we receive higher than would otherwise be.

Elmer, Mo. J. E. M.

May 21. We are getting the following prices for our farm products: Milk $1.40 per cwt.; we sell to the condensers. Butter 25; eggs 20; potatoes three-quarter cent per pound; oats $20 per ton; hay $12 per ton; straw $4 per ton. Hogs eight cents on foot; cattle 8½ on foot. We do not raise any fruit for the market, nor vegetables. We are buying onions for our store for 5½ cents; they come from Australia. We are also buying some Australian beef for our boarding house, paying 10 cents delivered at our station. This is a dairy country. The principle crops are hay and oats. Most of the farmers sell their milk or cream to the condensers or creameries. Cows are high. Almost any kind of a cow will sell for $100 or more. Many have sold this year for $150. No wheat raised here except for feed. Most of our vegetables and fruit comes from eastern Washington and California. R. G. B.

Belleville, Wash.

DE LAVAL
SEPARATORS
Used exclusively by
98% of the World's Creameries

TEN YEARS AGO THERE WERE a dozen different makes of creamery or factory separators in use. Today over 98 per cent of the world's creameries use De Laval Separators exclusively.

IT MEANS A DIFFERENCE OF several thousand dollars a year whether a De Laval or some other make of separator is used in a creamery.

EXACTLY THE SAME DIFFERences exist, on a smaller scale, in the use of farm separators. Owing to the fact, however, that most farm users do not keep as accurate records as the creameryman, or test their skim-milk with the Babcock tester, they do not appreciate just what the difference between a good and a poor separator means to them in dollars and cents.

NOW, IF YOU WERE IN NEED of legal advice, you would go to a lawyer. If you were sick you would consult a doctor. If you had the toothache you would call on a dentist. Why? Because these men are all specialists in their line, and you rely upon their judgment and skill.

WHEN IT COMES TO BUYING A separator why not profit by the experience of the creameryman which qualifies him to advise you correctly? He **knows** which separator will give you the best service and be the most economical for you to buy. That's why 98 per cent of the world's creameries and milk dealers use the De Laval exclusively.

THERE CAN BE NO BETTER recommendation for the De Laval than the fact that the men who make the separation of milk a business use the De Laval to the practical exclusion of all other makes of cream separators

Your local De Laval agent will be glad to let you try a De Laval for yourself on your own place. If you don't know the nearest De Laval agency simply write the nearest main office, as below.

The De Laval Separator Co., 165 Broadway, New York, 29 E. Madison St., Chicago

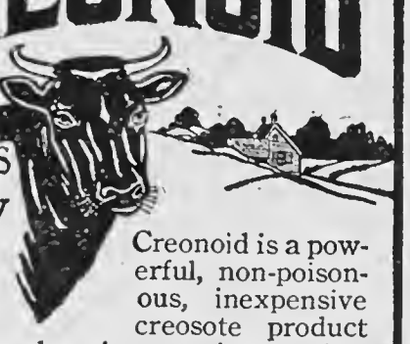
CREONOID



Drives Away Flies

Creonoid is a powerful, non-poisonous, inexpensive creosote product which is obnoxious to insects but not to animals or fowl. Spray it on cows to keep them from being tormented by flies. Spray in the hennery to exterminate lice. Result will be more eggs and more milk.

At most dealers.

BARRETT MANUFACTURING CO.
New York Chicago Philadelphia St. Louis
Pittsburgh Boston Cleveland
Kansas City Seattle Cincinnati
Minneapolis Birmingham

Why Feed Flies

You can get more cow's milk, more horse strength, more hog fat, if you keep off flies.

Use
Sirenia Oil

It is feed economy and animal satisfaction. Sirenia is made of pure oils. Sirenia is applied with a cloth, no sprayer necessary. Ask your dealer for a dollar can of it. Do not buy a substitute. There isn't any. If your dealer doesn't handle, send us his name and a one dollar bill and we will send a one dollar can, postpaid.

We Will Refund Your Money If Not Satisfied

Drives flies from cattle and horses, fleas from hogs and dogs, lice from poultry, ticks from sheep. It will also heal sores or scratches on animals. Send a dollar now; or write us a card for the endorsements of users who wouldn't be without it.

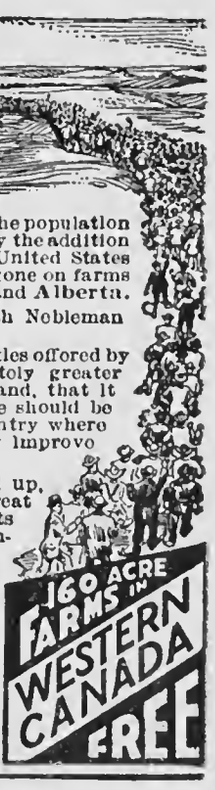
AMERICAN SEPARATOR CO. Box 1075 BAINBRIDGE, N. Y.

400,000 Settlers a Year



Immigration figures show that the population of Canada increased during 1913, by the addition of 400,000 new settlers from the United States and Europe. Most of these have gone on farms in Manitoba, Saskatchewan and Alberta.

Lord William Percy, an English Nobleman says:

"The possibilities and opportunities offered by the Canadian West are so infinitely greater than those which exist in England, that it seems absurd to think that people should be impeded from coming to the country where they can most easily and certainly improve their position."

New districts are being opened up, which will make accessible a great number of homesteads in districts especially adapted to mixed farming and grain raising.

For illustrated literature and reduced railway rates, apply to Superintendent of Immigration, Ottawa, Canada, or to the Canadian Government Agent.

THE EGG-LAYING CONTEST.

THE thirtieth week of the contest shows a little more falling off in egg production as the number of broody hens increase. The intensely hot weather of last week was another factor. Anything that tends to make the fowls uncomfortable, tends also to a decrease in the egg output. The English White Leghorns make the high score for the week; viz., 61, the same number that they laid last week. Their total lacks only two eggs of the 1,000 mark. This pen is steadily climbing towards the top, but five pens are now ahead of them. Chas. N. St. John's pen of White Leghorns takes second place with a score of 60, and the Buff Leghorns from Wolverine Poultry Farm are third with a score of 59. Three pens of White Leghorns tie for fourth place with scores of 58 each. They are Marwood Poultry Farm's pen, Thomas W. Moore's pen, from Connecticut and Chas. Heigl's pen from Ohio. A. B. Hall's pen of Barred Rocks tie with Geo. A. Cosgrove's White Leghorns with score of 57 each.

The pen average of the White Leghorns is now far ahead of that of any other breed. The average this week for the whole 33 pens, is 51.2; for the White Wyandottes it is 39.4; for the S. C. Reds it is 38.3; for the White P. Rocks it is 41.5; for the Barred Rocks it is 47. But now is the time of the year when the non-setting qualities of the Leghorn gives the breed a decided advantage over the broody kind. Below is the week's record:

GEO. A. COSGROVE.

Henhouse Curtains; Egg Eaters.

If J. B. W., page 612, will tack the muslin on the window frames of his henhouse with two or three small pleats on every side, the wind slatting the loose cloth will keep it from becoming clogged with dust.

I think if H. H. W., page 615, will stir up a mash of wheat bran and good strong vinegar and feed his hens all they will eat of it once a day for three days in succession the hens will stop eating their eggs. V. E. K.

Mexico, N. Y.

Protrusion of Oviduct.

I have a fine flock of hens, but they are afflicted with some unknown disease that causes protrusion of the oviduct. Can you give me some light on this matter? A. Z.

New York.

This trouble is probably inflammation of the egg tube, or oviduct, and may be caused by heavy laying while the fowls are closely confined and forced for egg production. Irritating food, overly large eggs, excess of pepper or other condiments in the food, or other conditions which lower the vitality of the hen, probably predispose to this trouble. Giving the fowls free range, if possible, and feeding plenty of green stuff, with little meat or other stimulating food should correct the trouble. Those that show protrusion of the oviduct in the form of a reddish mass at the vent should be promptly removed from the pen as the other fowls are apt to peck at and finally kill such hens. M. B. D.

Cleansing an Incubator.

Can you tell me what will take that offensive odor from the incubator after a hatch? I have tried scrubbing with hot water and have burned sulphur in it with no results. Others report the same trouble. H. W. M.

Ohio.

I have never noted any offensive odor about an incubator which thorough scrubbing with hot water and soap would not remove; if the trays and the interior are clean there should be no offensive odor. If such an odor persists after cleaning, however, it is possible that chloride of lime placed in the hatching chamber upon a shallow dish would destroy it, or thorough sunning of the machine in the open air might be efficacious. M. B. D.

Colds; Loss of Feathers.

1. I have some hens that make a noise like whooping, have been so for three weeks. I have given them coal oil, sulphur, rubbed throat with turpentine. When they breathe, mouth opens and there is a loose rattle. What is the disease, and a cure? 2. What is the matter with hens when the feathers fall off their heads and the scalp seems to be scaly? They are getting worse; not all are affected. I have rubbed them with lard and sulphur, also coal oil but that does not seem to do any good. G. M. B.

Michigan.

1. Hens are subject to "colds," or catarrhal inflammations of the respiratory tract which cause them to breathe with evident difficulty and there are certain fungus growths derived from moldy litter which also obstruct the breathing. The most common cause of the symptoms that you describe is exposure to dampness and drafts in poorly constructed roosting quarters and the remedy is removal of the cause, or of the hens to better quarters. Permanganate of potash crystals dissolved in the drinking water, a teaspoonful to the quart, is helpful in overcoming the colds.

2. Loss of feathers from the head and neck is usually due to the work of the depluming mite which burrows in the skin at the base of the feathers. A little simple grease, to which may be added one fourth its bulk of "blue ointment," will destroy the mite and give an opportunity for new feathers to grow. This should be rubbed into the bare spots. The chapter on diseases of fowls in the "Business Hen," published by THE R. N.-Y., contains about all one needs to know of the ordinary poultry diseases and their treatment. M. B. D.

VIBERT RED FARM, Box 1, Weston, N. J.

INT'L EGG-LAYING CONTEST
COLONIAL REDS WIN over every American entry of the American breeds. Our pen of Reds, single comb, beat every American entry of the American breeds, each bird averaged for the year, 194 EGGS. Official record. We offer EGGS FOR HATCHING, from our pedigreed stock that we honestly believe are the strongest-laying lines produced to date. Our mating list will tell you details and prices, and will be sent on application. We promise honorable treatment. We are the breeders that furnish all the birds that the *Youth's Companion* ship out to their subscribers. Shipments made to forty-six States the past year. COLONIAL FARM, Box O, Temple, New Hampshire

BARRED ROCKS
Eggs—$1 per 15; $3.50 per 100. Baby chicks.
B. H. HENION, - Brockport, New York

"Perfection" Barred Rocks—Every pen headed by prize-winners (Ringlet strain). Eggs, $2 per 15; 3 settings for $5. Utility eggs (free range) $1 per 15. Dr. HAYMAN, Box R 48, Doylestown, Pa.

PUBLISHER'S DESK

Your Woman and Home monthly department is getting to be one of the strong features of the paper. G. C.
Connecticut.

Certainly it is. We intended it should be. But wait. We have not been able to do it justice because the old press had more work than it could do. Our new 64-page two-color duplicate press will be in some time during June. It always takes a few weeks to adjust a new press and get it working just right, but we expect to have it working in fine shape by September. In the meantime the Woman's Department will be developing and we propose ultimately to make it the best magazine for farm women to be found in this country or any other country. Just watch it grow and develop in character and importance and interest.

A writer in one of the farm papers discussing the New York coöperation law says this:

The form of by-law sent out by the office of the Commissioner of Agriculture provides that each subscriber for stock on organization of an association under the law shall pay in 20% above par to form a reserve fund. Thus a person subscribing for $100 par value of stock would pay in $120. Should a stockholder die, under this provision his estate could be mulcted out of the difference between the book value of the stock and its par value.

This indicates a confusion of mind in reference to corporate stock companies. The stock of a corporation simply indicates the fractional part of the company that he owns. If the company has a surplus or reserve fund, he owns his fractional share of that also; and there is no way himself or his estate can be mulcted out of his share of the surplus any more than he could be mulcted out of the par value of the stock. It is easy enough for a man unfamiliar with stock company affairs to make an error of this kind, but we ought to be able to expect something better from a publication that assumes to instruct the people. Of course, it is entirely optional with the local organizers of a coöperative company whether they provide a reserve fund or not; but if they do they are just as fully protected in the reserve fund as they are in the capital of the company.

Herbert Myrick wants to know if any of the subscribers to his papers have had unsatisfactory dealings with John W. Woodruff. We rise to speak. Some years back Woodruff was organizing branches of the American Farm Co., in different sections of New York State, and getting from $12,000 to $20,000 out of a section. THE R. N.-Y. showed him up, and while it was defending Woodruff's libel suits for a half million dollars, Mr. Myrick was giving him encouragement and support in the State by publishing his advertising. If any of his subscribers lost their investments as a result of the advertising perhaps Mr. Myrick will now make good their losses. These victims now have the floor.

I was informed by some who were present at the last Chicago National Convention on Farm Credits and Marketing, that it was a bankers' and big business men's affair. Out of the 500 who attended there were only 16 farmers. While I do not want to be understood as being against business men, yet I cannot but feel that a movement of this kind should, at least, be controlled by men who are actual farmers, and not by men who profit by the system of marketing which is now in vogue. I understand that at this convention the Minneapolis Chamber of Commerce and the Chicago Board of Trade were much in evidence. We had hoped to gain recognition there, and have one of our men on the program, but this was denied us. From what I have heard of this convention and of the men at the head of it, I do not believe that very much good to the farmer will result from the work. J. M. A.
North Dakota.

One of the progressive farmers of New York State sent us the above letter to him from a mutual friend of the Northwest. He accompanied it with the following comment: "Think of it! The livest marketing coöperative organization in the entire Northwest denied a place on the programme of a National Marketing Commission!" There are a number of farmer-uplift concerns just about as near the farmer as this one, and I think it would not be amiss to print the experience of the Equity Coöperative Exchange for the general information

Please advise whether I should send $25 to the Southern Georgia Railroad Land Development Bureau, Washington, D. C., as requested in the inclosed letter? I cannot go to see the property at present but if you think the affair good, I should not mind spending the money.
New York. (MISS) G. V. S.

We have been unable to get any satisfactory information as to the standing of the concern. The party in charge of the Washington office replied that he had instructions to say that they did not care to give out information regarding the Bureau. The most that we can make out of the literature is that they are willing to give you a five or ten acre plot of land somewhere for $25. Where it is and what it is worth we do not know, except that it is somewhere in Georgia. The literature is distinctly of the land promotion type; and altogether our advice to our correspondent is to keep her $25.

Noting in Publisher's Desk, page 754, what F. F. H., Ohio, says about truss he got from Chas. Cluthe & Sons, 125 E. 23d St., New York, I had about the same experience a few years ago. J. D. S.
New Jersey.

It always happens that way. The experience of one is usually the experience of many others. If these experiences were generally known, there would be fewer disappointments. We propose that our people, at least, shall know them.

On page 582, in issue of April 11th, we referred to two sales of hothouse lambs, one being made by Phillips & Sons, 277 Washington Street, and the other by Read & Garrison of 322 Washington Street. The farmer said the shipments were exactly alike and made at the same time. Read & Garrison returned sales for $14, and reported the lambs prime; Phillips & Son returned $7 and reported that they sold the extreme top market price considering their condition and that the pelts were covered with lice. We made some general comments on the matter, and Messrs. Phillips & Sons have complained to us that this article unfairly accuses them of having been guilty of some impropriety in the handling of the two lambs shipped to them. They say that they do not handle or make a business of handling hothouse lambs; that they do not solicit, nor do they care to handle them; that the two lambs in question came to them unsolicited and from a person who had never been a customer; that upon receiving them they did the best they could to dispose of them at the best prices obtainable.

We sent this name to our subscriber because the firm had been long in business, had a high rating and stood well in the trade. Its announcement said they handled calves, and we took it for granted they handled lambs. Our criticism was intended to be a general marketing condition of which this was a mere incident and all of which it was hoped the new Market Commission would in time correct. We intend no innuendo in THE R. N.-Y. When the interest of readers demand it, we try to give the facts, and when we criticise we try to leave no doubt of the intent, but we would not for any purpose or consideration knowingly allow a reflection on an honest name, and we did not intend to make any accusation of dishonesty against this firm in connection with this transaction.

J. J. D.

Bumble-foot.

I have several chickens which have a boil on the ball of the foot. The foot around the toes swells up and becomes very hot. The substance which they excrete is very thin and white. Three of my chickens died. Could you tell me the cause of this and if there is any cure for this? L. M.

This is the so-called bumble-foot, or abscess formation in the sole of the foot. Bruising of the feet by jumping from high perches to hard floors probably predisposes to the trouble, which is directly caused, however, by infection through a slight injury of some kind, such as vigorous scratching might produce. Like any abscess, it should be treated by being opened freely, the contents syringed out and the wound dressed with some antiseptic ointment, such as carbolized vaseline in 5% strength. The fowls should then be kept upon clean floors or runs until the wound has healed. M. B. D.

Chicks that Pick Toes—What Will Stop It?

One of our readers in California says he has been greatly troubled by having the chicks picking each others toes. They keep up this practice until considerable injury is done. He wants to know if the trouble is general among poultry keepers, and what they do to stop it if it once gets started.

We have noticed that this complaint almost invariably comes from persons who are trying to keep too many chickens in a small enclosure without a sufficient amount of exercise, and without a proper supply of green feed in their ration. Small flocks of chicks on a free grassy range practically never acquire this destructive habit. We have had several reports this seson of considerable damage being done from this cause. Although we are raising over thirty thousand chicks here this year we give them free range, and keep them in small enough colonies so that we seldom have a case of toe picking C. S. GREENE.
New Jersey.

I have never been troubled with the little chicks picking each others toes, except perhaps before they had received their first feed. The cause undoubtedly must be improper feeding, and consequent malnutrition. I feed sour milk liberally, and I believe that its addition to the diet of the chicks ought to help overcome the habit. Depriving the chicks of sufficient bone and feathers forming food elements i. e. bone meal, granulated bone, beef scrap, etc., would undoubtedly favor the formation of the habit. The application of flexible collodion to the sore toes will help prevent further injury.
New York. J. C. DINGMAN.

This vicious habit is most liable to develop with specially strong chickens which are closely confined and which are not kept busy. It occurs more often and is more serious when there is no meat or animal food in the ration, though when they get a taste of blood it seems to make them crazy whether they have meat or not. As usual prevention is the best cure. Give the chicks as much room as is practical and keep them busy—digging chick food out of litter, tearing sod to pieces and working at green stuff, either sprouted oats, mangels which have been split open or rye or oats which have been cut up for them. Where the trouble has developed, much can be done along these lines and of course any which have been injured removed. Generally the habit can be checked by catching a few of the worst offenders and either removing them or clipping a little off the end of the beak, enough to just start the blood a little. This makes the beak sore and while they are thinking about the hurt they forget the toe picking. FRED B. SKINNER.
New York.

This is very common trouble where one keeps large numbers of chicks together, and I have lost many chicks by it years ago. It comes from idleness. I think—"Satan finds some mischief still for idle chicks to do." But when they get a taste of blood they act crazy, and soon eat up the chick. I have taken 20 picked chicks out of one brooder in 12 hours some years ago. By a little watchfulness to check it when first started we have no more trouble nowadays. At the first sign of this trouble I hang a piece of lean tough meat by a string just so it will clean the floor, and it seems to take their attention and satisfy their abnormal craving, and it is rarely ever necessary to put a second piece in the same brooder. FLOYD Q. WHITE.
New York.

The Cornell feeding method will prevent the acquisition of this bad habit, particularly if an abundant supply of sour skim-milk or buttermilk is always at the reach of the chicks. Any little injury to a toe will start it, and we must be ever watchful to stamp it out as quickly as possible. A little pine tar on the injured toe, with separation from the flock for a few days, will put the injured chick on the job again. Aside from accidents, I regard it as a sure indication of a faulty ration. FRED. M. PEASLEY.
Connecticut.

It has been my experience that the most natural thing for young chicks to do when first hatched is to pick at anything prominent or that moves in front of them, which accounts for the inclination to pick at each others toes, or even their own toes when closely confined. If the web of the toe has been punched in such a way as to produce a wound, on which blood appears, it immediately attracts the attention of the young chicks, and they pick at it, and their natural predisposition for animal food in their diet, gives them the inclination to keep on picking until they produce injury. I was troubled with this when I first started to raise chicks, but by giving them more space and a good percentage of blood meal, or other animal food, in their rations, the trouble entirely disappeared, and we have had none of it for years.
New York. SINCLAIR SMITH.

"So Miss Bangs didn't get any damages in her breach-of-promise suit. Couldn't she prove anything?" "She proved too much." "How was that?" "She drew such a picture of the faithless man that she convinced the jury he wasn't worth thirty cents."—Baltimore American.

WHEN you write advertisers mention THE R. N.-Y. and you'll get a quick reply and a "square deal." See guarantee editorial page.

Is Your Corn Safe?
Is it protected against vermin, fire and theft? Is it well-cured, ready for the highest market price? You can answer all these questions with yes after installing a
Marshall Corn Crib
Made of heavy galvanized iron that lasts a lifetime. Perforated body and ventilating shaft insure perfectly cured corn. Built along scientific lines, easy to erect, all sizes. Write today for free illustrated catalog, showing all styles.
Iron Crib & Bin Co., Box 25 Wooster, Ohio

DIGGERS
for potatoes—4 styles to choose from to suit your special conditions. We guarantee them to do the work we claim for them. All growers know that it pays to use diggers even on five acres—they save much valuable time and save all of the crop in good condition.
IRON AGE DIGGERS
No. 155 For Heaviest Conditions

Wheels, 32 or 28 inch. Elevator, 22 or 20 inches wide. Thorough separation without injury to the crop. Best two wheel fore truck. Right adjustment of plow, shifts in gear from the seat. Can be backed, turns short into next row.
Ask your dealer about them and write us for descriptive booklet.
BATEMAN M'F'G CO. Box 102D Grenloch, N. J.

Harder Silos
Catalog Free
For 15 years the one Best Silo. Great improvements this year—better than ever. Solid as an oak; owners now laugh at storms. More durable than concrete, more profitable than tile. Massive strength, surprising solidity, perfect fitting and easy operating doors. The kind "Uncle Sam" uses.
It will pay you to write us today for free catalog of Harder "Quality" Silos.
Harder Mfg. Co., Box 11, Cobleskill, N.Y.

Fill Your Silo Pay when Satisfied
Over 64 Years Experience Back of it.
ROSS Machines are fully guaranteed
You take no risk

Oldest and Largest in the World

Products, Prices and Trade.

Wholesale Prices at New York.

Week Ending June 6, 1914.

MILK.

The Borden milk schedule to producers for the six months beginning with April is as follows, compared with last year. This is per 100 pounds in the 26-cent zone. For the 29 and 32-cent zones the schedule is 10 cents less for all months:

	1914	1913
April	$1.40	$1.50
May	1.15	1.25
June	1.10	1.10
July	1.25	1.35
August	1.40	1.45
September	1.50	1.55

Figuring 86 pounds to the 40-quart can the per quart price is as follows: April, 3.01 cents; May, 2.47; June, 2.36; July, 2.68; August, 3.01; September, 3.22.

Wholesale prices paid by New York dealers are running $1.51 and $1.41 for B and C. Hotels and restaurants using two to three cans per day are paying 4¾ to five cents per quart. The supply for New York trade is increasing, but the demand is good and no special price reductions noted.

BUTTER.

Early in the week the market advanced one cent and was decidedly firm, but weakened later. The advance was held on the top grades, but considerable price cutting was noted on qualities running medium or lower. Speculators are on the watch for long lines of uniform quality for storage, as for holding this is much preferable to small odd shipments.

Creamery, extra, lb	27	@	27½
Good to Choice	23	@	26
Lower Grades	20	@	22
State Dairy, best	25	@	26
Common to Good	18	@	23
Factory	16	@	19
Packing Stock	15	@	17½

Elgin, Ill., butter market 25¾ cents.
Philadelphia, western creamery, 27 cents.

CHEESE.

The market is active, owing to the large speculative demand, prices running from one-half to one cent above last week. Current receipts of whole milk are kept cleared up closely. Receipts of skims are only moderate, but business very quiet.

Whole Milk, new, best	14¼	@	14½
Common to good	11	@	13
Skims	5	@	10

EGGS.

The market is firm on the better grades, which form a comparatively small part of the receipts. There is a general complaint of heat damage, which makes close candling necessary for supplying critical trade. Some very fine white duck eggs are seen, but the demand for them is slack and prices running barely on a level with hens' eggs of similar quality. Most shippers nail the cover of egg cases too firmly to the middle partition. A nail quite near each edge of the cover at this point is sufficient. The cover can be removed without breaking, which often happens when trying to get out the inside nails. An egg case may have to be opened and closed two or three times before reaching the retailer.

White, choice to fancy, large	23	@	23½
Common to good	18	@	22
Mixed colors, best	22	@	23
Common to good	17	@	20
Western fresh, white	21	@	22
Lower grades	15	@	18

FRESH FRUITS.

Apple trade is dull mainly owing to the inferior quality of the apples offered. Peaches from Georgia are now arriving in carload lots, selling from $2 to $2.50 per crate, wholesale. Strawberries are plentiful and very low. Some speculators who bought heavily in the Middle South have had heavy losses on the shipments sent here. At these low prices the wagon peddlers dispose of large quantities. They are able to retail a fair quality at two quarts for 25 cents.

Apples—Russet, bbl.	2 25	@	3 00
Spy	3 00	@	5 00
Ben Davis	2 50	@	3 00

Old stock	15	@	18
German crop	63	@	67

VEGETABLES.

Old potatoes picked up a little the latter part of the week, with a shilling advance on some grades of State and Western. Receipts of new from the South very large, some out of condition so that they were abandoned as worthless or seized by the health authorities. Onions dull, except for the best grades. Peas and green beans very low and many of them in poor condition. Cabbage trade active, but prices practically unchanged. Cucumbers and tomatoes in heavy supply and low, except for the best.

RETAIL PRICES AT NEW YORK.

These are not the highest or lowest current prices, but are fairly representative of what the majority of New York consumers pay:

Eggs, fancy white, doz.	30	@	35
Mixed colors, new laid	24	@	28
Ordinary grades	20	@	22
Butter, fancy prints, lb.	32	@	34
Tub, choice	27	@	29
Chickens, roasting, lb.	30	@	32
Fowls	25	@	28

May 24. We had a sudden drop in temperature and two hours' cold, drizzly rain when 90 per cent. of the Baldwins were in full bloom, followed by 20 hours' cold wind. Today is ideal. Bloom profuse with Baldwin and Ben Davis; Greening fair, Wealthy and Duchess full.

North River, N. Y. E. M. C.

Hogs, live, 7¼ to eight; hogs, dressed, 10. Butter 20-26; eggs 18; chickens 14; veals, live, eight; good cows sold this Spring from $60 to $80, as to condition. I think $70 would be a fair average. Cows are very scarce. Farmers are raising more calves now. Horses are very high; any good horse will bring from $200 to $300; three and four-year-olds from $150 to $250. Very few sheep kept (plenty of dogs). The writer sold two good grade ewes for $23. Potatoes $1 a bushel. J. H. R.

Woodcock, Pa.

Cattle and horses are very high; former about nine cents per pound and horses all the way from $100 apiece to $500 a span, mules nearly same. In my county butter is 25; eggs 17; hogs $7.90 per 100 pounds; potatoes $1.20. Hay $19; clover same; millet seed $1.50. Apples and peaches were very high last Fall and Winter; apples now are about $3 a bushel. Promise at present is for a fair crop of peaches and apples. Not very many strawberries grown in our part of the State, and now very dry. Wheat and oats short. H. E. N.

Curryville, Mo.

May 24. Corn 95 per cwt.; wheat 90 a bushel; oats 37; barley 50; rye 56; clover seed $7; Alsike $8; Timothy $2; Timothy hay, bales by farmer, $15.50; Timothy hay, baled by farmer and delivered to car, $15.50; mixed $14; clover $12; potatoes 75; seed potatoes $1 to $1.50; eggs 16; butter 18 to 30. Season very late and wet; some corn up, but only about half corn planted. Planting will not be completed before June 1. Wheat, rye and grasses looking finest in years. Rye beginning to head. Oats coming along in good shape but seeded late. All fruit looks well, especially strawberries.

New Haven, Ind. H. H.

Dairy cows from $40 to $80, grades; bulls, registered, $35 to $100 per head. Beef cows $55 to $75; steers, two years, $55 to $65; three years $65 to $75. Hogs 6½ to 7½ per pound; sheep $2.50 to $5 per head. Horses: mares, draft, 1,400-1,600 pounds, $175; 1,600-1,800 pounds $200; chunks, 1,200 pounds, $125; geldings, 1,400-1,600 pounds, $150. Mules, 1,300-1,400 pounds, $175. Poultry, one dozen common, $3.50; turkeys 15 cents per pound; ducks 10 cents per pound. Butter, creamery, 30; farm butter 20; eggs 15-20 cents; butterfat 22-30. Alfalfa $7 to $7.50 per ton. These are cash prices, time sales bring higher prices.

Caldwell, Idaho. G. P.

At auction sales everything brings a good price for everything, household utensils, furniture, etc. There has been an unusual lot of sales the last three or four years, people disposing of everything to move on to Canada. Horses sell here at all prices from $50 to $250, according to age and condition. Cows are from $45 to $102. The latter was paid for a common cow in a sale. Cattle have brought unusually high prices; calves $6 just born; yearling calves $20 in Fall. Chickens are from 40 to 45 cents; hogs very high; young pigs at weaning $7 a pair. This Spring there is an unusual lot of pigs in the immediate vicinity. Butter at stores 18; eggs 12½ at some towns, others 15. Cream 21 cents a pound for butterfat in cash, or 23 cents in trade. Two merchandise stores take cream from two different creameries; cream is shipped to Minot. This country has not advanced to have a creamery of its own, so it is only stations. Wheat and flax is the principle money crop here. An unusual amount of interest is centered in silos, so a big acreage of corn is to be planted to fill these new ornaments. I understand they cost, say 14x30 feet, about $300 or $350. Garden truck is a fizzle here; no market, only once in a while. Onions sell readily at two cents a pound; potatoes sell around 50 cents to stores; they retail at 60. Considerable have been raised the last two years, each individual ships his own in carload lots. They go to St. Paul or Kansas City. Several report poor returns. Almost every farmer raises horses here. This Spring they are not in very good demand. Wages are $35 and $40 a month with board and washing. There are a number of steam and gas plowing outfits. Oats 35; barley 50. Crop failure by hail last year. F. S.

Lansford, N. D.

DO YOU NEED FARM HELP

We have many able-bodied young men both with and without farming experience, who wish to work on farms. If you need a good, steady, sober man, write for an order blank. Ours is a philanthropic organization and we make no charge to employer or employee. Our object is the encouragement of farming among Jews. THE JEWISH AGRICULTURAL SOCIETY, 176 Second Avenue, New York City.

The FARMERS' BUREAU an agency exclusively for agricultural help. Only first class farm help and positions solicited. References investigated. Scientific advice on farm problems. Dept. R, 150 Nassau St., N. Y. Phone, 5365 Beekman

FARMERS' SECURITY BUREAU, NEW YORK Agency Famous for Reliable Farm Help. No Branch. SIDNEY SULLIVAN, Expert, 99 Nassau Street

Subscribers' Exchange

Complying with several suggestions received recently, we open a department here to enable RURAL NEW-YORKER readers to supply each other's wants. If you want to buy or sell or exchange, make it known here. This Rate will be 5 Cents a word, payable in advance. The name and address must be counted as part of the advertisement. Copy must reach us not later than Friday to appear in the following week. No display type used, and only Farm Products, Help and Positions Wanted admitted. For subscribers only. Dealers, jobbers and general manufacturers' announcements not admitted here. Poultry, Eggs and other live stock advertisements will go under proper headings on other pages. Seed and Nursery advertisements will not be accepted for this column.

WANTED—Intelligent, energetic woman or man to work on mouse farm, July or longer. A. LATHROP, Granby, Mass.

WANTED—Job on poultry farm by reliable young man, 18 years; references. ROGER RAMSAY, 1519 Sunnyside Ave., Chicago, Ill.

SITUATION WANTED on dairy or fruit farm by city man; experience more than wages wanted. EXPERIENCE, care R. N.-Y., 333 West 30th St., New York.

COLLEGE STUDENT WISHES WORK for the summer on general farm; very little remuneration expected. K. I. B. T., 141 Herkimer St., Brooklyn, N. Y.

YOUNG MAN, 19, wants work on farm for school vacation; milker, hand mower; three Summers' experience; reference. R. A. MOORE, Rutland, Vt.

FARMER'S DAUGHTER, with hospital experience, wishes position as nurse or companion; physicians' reference; please state compensation. BOX 75, Hanover, York County, Pa.

WANTED—By young married man of wide, practical experience, position in charge of purebreed herd where results are desired; fully familiar with breeding, feeding, A. R. O. work, buttermaking, etc. Address BOX 192, Peekskill, N. Y.

WANTED A JOB FOR JULY AND AUGUST by a high school boy, 16½ years; height 5 feet 8 inches, 162 lbs., on farm, place, camping or surveying party, where he can make himself useful; bright and intelligent. Address CLARK, care R. N.-Y., 333 West 30th St., New York.

POULTRYMAN—Graduate poultry course, with two years best practical experience; at present in full charge entire plant of 3,000 hens and ducks; best references from present and past employer. German, age 33; single. WILLIAM SCHUKOWSKY, Lime Ridge Farm, Poughquag, N. Y.

HOUSEKEEPER WANTED—Widow with young daughter; capable, cheerful, above reproach; pretty village home; churches, school near; easy place (myself and niece); no tobacco, drinking or dogs; no washing; permanent, peaceful home for right one. Address, giving full particulars, A. T. COOK, Seedsman, Hyde Park, Dutchess County, N. Y.

WANTED—By strictly sober and industrious single man, position as herdsman or dairyman combined, or would accept either one singly. A1 butter-maker; life experience in handling and caring for stock; best of references given and required; state wages and full particulars in first letter. Address DAIRYMAN, General Delivery, Portchester, N. Y.

WANTED—Position as herdsman or caretaker by strictly sober, single man; life experience in handling and caring for stock; fully capable of handling large farm and dairy; no encumberance; can go anywhere. State wages and full particulars in first letter; no triflers need answer; best of references given and required. Address S. J., care R. N.-Y., 333 West 30th St., New York.

ALFALFA HAY. F. P. ERKENBECK, Fayetteville, N. Y.

HORSES THOROUGHLY AND CAREFULLY broken to saddle for the road or field; distance no object. L. HOWARTH, Mt. Freedom, N. J.

RUGS FOR SALE—Woven in hand-loom; firm, colored with old-fashioned dyes, bright, pretty. Write CORDELIA A. PATTERSON, Groton, N. Y. R. D. No. 11.

VERMONT MAPLE SYRUP @ $1.00 PER GAL. Maple sugar, 10-pound pails, 15 cents per pound; fancy caked sugar, 18 cents. Choice fresh eggs in any quantity. JAY T. SMITH, Rupert, Vermont.

EARLY RICHMOND CHERRIES—June 25th to July 5th; Morency's, July 5th to 10th; 6 cents pound in baskets; delivered express office. Canned on the farm in 2-pound enameled sanitary cans; syruped, with pits; $1.25 per dozen. SENECA FRUIT FARM, Waterloo, N. Y.

MAPLE SYRUP FOR SALE FROM THE MAPLE Grove; taking a first prize at the Centennial Exposition; guaranteed under the provisions of the Pure Food and Drug Act; in gallon cans, $1.25 for a gallon f.o.b Norwich, B. & M. R. R. Price of 50 gallons on application. GOVE HILL FARM, Donald MacKay, Supt., Thetford Center, Vt.

FOR SALE—Highland Farm. For particulars address GEO. W. MILES, Georgetown, Del.

FOR SALE OR RENT, Morristown, N. J.—65 acres; beautiful dwelling; every improvement. CLARKE, 2062 Ryer Ave., Bronx, N. Y.

FOR SALE—320-acre Virginia apple orchard; 800 bearing trees; 800 two-year trees; station five miles. Enquire C. C. WHEAT, Big Island, Virginia.

TO RENT—Furnished house for Summer in a beautiful locality, six miles from Amsterdam, on macadam road. Address CHAS. I. SCHUYLER, R. D. 2, Amsterdam, N. Y.

FLORIDA FARM FOR RENT—Crops growing every month in year; near church, school and best of markets; tenant to furnish good horse and tools. F. L. ADAMS, West Tampa, Fla.

FRUIT, TRUCK, POULTRY FARM FOR SALE—36 acres, excellent location and market; good buildings; all kinds fruit; strong soil; with or without stock, etc.; buy direct, saving commission. HOMER TWEED, Quakertown, Pa.

FOR SALE—Fruit farm, 140 acres; 600 barrels apples last year; prospect 500 this year. Price $4,000. For particulars apply C. G. ADAMS, Colerain, Mass.

FOR SALE—Fruit and poultry farm; 32 acres; excellent land; good water; cherries, plums, pears and apples for market; fully equipped poultry plant; 10 minutes walk to station; telephone and R. D. GEO. WHITENACK, Skillman, N. J.

275 ACRES—Good buildings; cuts 60 tons hay; 1 mile large railroad; village; adjoins large lake Summer resort; 500,000 feet timber; large sugar grove; four apple orchards. Cheap to a quick buyer; part cash. Address OWNER, Box 82, Wilmington, Vt.

HUMOROUS

"WAS your husband cool when you told him there was a burglar in the house?" asked Mrs. Hammer. "Cool," replied Mrs. Gabb. "I should say he was cool. Why, his teeth chattered."—Cincinnati Enquirer.

"DID you kill the moths with the balls I recommended?" asked the druggist. "No, I didn't," said the customer truculently. "I sat up all night and didn't hit a single moth."—Cleveland Plain Opinion.

"SEE here, waiter," exclaimed the indignant customer, "here's a piece of wood in my sausage!" "Yes, sir," replied the waiter, "but I'm sure—" "Sure nothing! I don't mind finding the dog, but I'm blowed if I'm going to eat the kennel, too."—Tit-Bits.

"WITH telephones and automobiles," said the economist, "the farmer will soon be entirely independent of the city." "Never," replied Mrs. Corntossel. "We'll always have to be going to town—unless they discover some way of sending moving pictures by mail."—Washington Star.

"WHY, look here," said the merchant, who was in need of a boy, "aren't you the same boy who was in here a week ago?" "Yes, sir," said the applicant. "I thought so. And didn't I tell you then that I wanted an older boy?" "Yes, sir. That's why I'm back. I'm older now."—Ladies' Home Journal.

"IT'S surprising how unpractical some very learned men are." "Yes, there's Professor Lingwist, for example. He spent over half his life in acquiring fluency in nine or ten different languages, and then went and married a wife who never gives him a chance to get a word in edgeways."—Melbourne Australasian.

"I UNDERSTAND that you have a very fine new baby brother," said the minister. "Yes, sir," replied young Percy. "He is a nice baby." "And," continued the minister, "I hope he is a good baby." "Oh, I guess he is," said Percy dubiously. "He don't smoke or drink any, but sometimes he seems to me to swear some."—Christian Advocate.

WILLIS: "What's the election today for? Anybody happen to know?" "Gillis: "It is to determine whether we shall have a convention to nominate delegates who will be voted on as to whether they will attend a caucus which will decide whether we shall have a primary to determine whether the people want to vote on this same question again next year."—Puck.

WHEN Jasper got back to his office his boss said: "Look here, does it take you a half hour to go down to the corner and do an errand for me?" "It did this time, sir," answered Jasper. "A man dropped a quarter down a hole in the sidewalk." "And it took you all this time to get it out?" "Yes, sir; you see, I had to wait till the man went away."—Savannah News.

THE school teacher exclaimed, impatiently, one afternoon: "Johnny Jones, what are you fumbling with there?" Johnny hung his head and was silent. But the telltale of the class spoke up: "It's a pin he's got, ma'am." "Well, take it from him," said the teacher, "and bring it here to me." This was done, and then, in a mollified voice the teacher said: "Now, Johnny Jones, get up and recite your history lesson." But Johnny did not obey. He blushed, hung his head and sat still. "Johnny," said the teacher, "rise, I tell you!" Then the little fellow blurted out, distressfully: "I can't ma'am. That there pin you took is what holds me trousers up!"—Pittsburgh Chronicle-Telegraph.

Why John Deere Hay Presses Give Best Service

John Deere Motor Press

THE press that gives the best service of any of its size because it does better work more rapidly and with a smaller engine. It is the press with the powerful eeeentric drive. Gears are mounted off center, giving greatly inereased power on working stroke, just when it is needed, and a quick return of the plunger on the idle stroke.

Double drive with straight belts and belt idlers eliminates wear on the belts, press and engine bearings, equally distributes the work, more readily transmits the power and results in smoother operation.

Plunger has a prying instead of butting action, relieving press of all jar or shock. There are no back gears or fly wheel, which means fewer parts to operate, less repair expense and less power required to operate the press. Self feed carries hay well down into baling chamber, while improved block dropper, *patented* tucker and powerful plunger make smooth, well pressed bales, the kind that bring the highest price.

High grade steel frame is continuous throughout without joints or splices; baling case will withstand all strain. Easily removable, well built gasolene engine is mounted on main frame, making a complete, self contained motor press easily moved and always ready for work.

John Deere Self Feed Pull Power Press

GIVES the best service of any two-horse press because it is a pull power press. Pull power delivers bales to the front out of the way of dust and dirt and enables you to set press at center of stack, the most convenient point. You don't have to move it from one end of stack to the other. Work can be done with one less man than with push power presses.

Pull power feature does away with necessity for high, heavy and dangerous pitman. Horses do not have to delay in stepping over pitman, and you do not waste horse flesh in doing the work. Self feed increases capacity. Feeder arm carries hay well down into baling chamber and evenly packed square end bales are always assured.

Built in three standard sizes, 14x18, 16x18 and 18x22, with capacity of ½ ton to 1½ tons per hour. A simple but very serviceable press that always gives satisfaction.

The Fuller & Johnson Farm Pump Engine And His Friends

Tried and True

The Fuller & Johnson Farm Pump Engine makes friends with everybody. It is the friend of the farmer, of his wife, his family, the hired men, and his thirsty cattle. **Why Not?** It relieves himself, family and hired help of a disagreeable job and administers to the wants of his faithful animal servants.

It is very simple to run and entirely safe. The operating cost is very small. It comes all ready to run and needs no belts, braces or special platform.

Besides pumping, it will run the grindstone, churn, separator, wash machine, etc. It is as handy as the thumb on your hand.

Let us send you our Catalog No. 17 and fully describe the wonderful little engine to you.

VOL. LXXIII, No. 4260. NEW YORK, JUNE 20, 1914. WEEKLY $1.00 PER YEAR.

SHOW POINTS OF A HOLSTEIN COW.

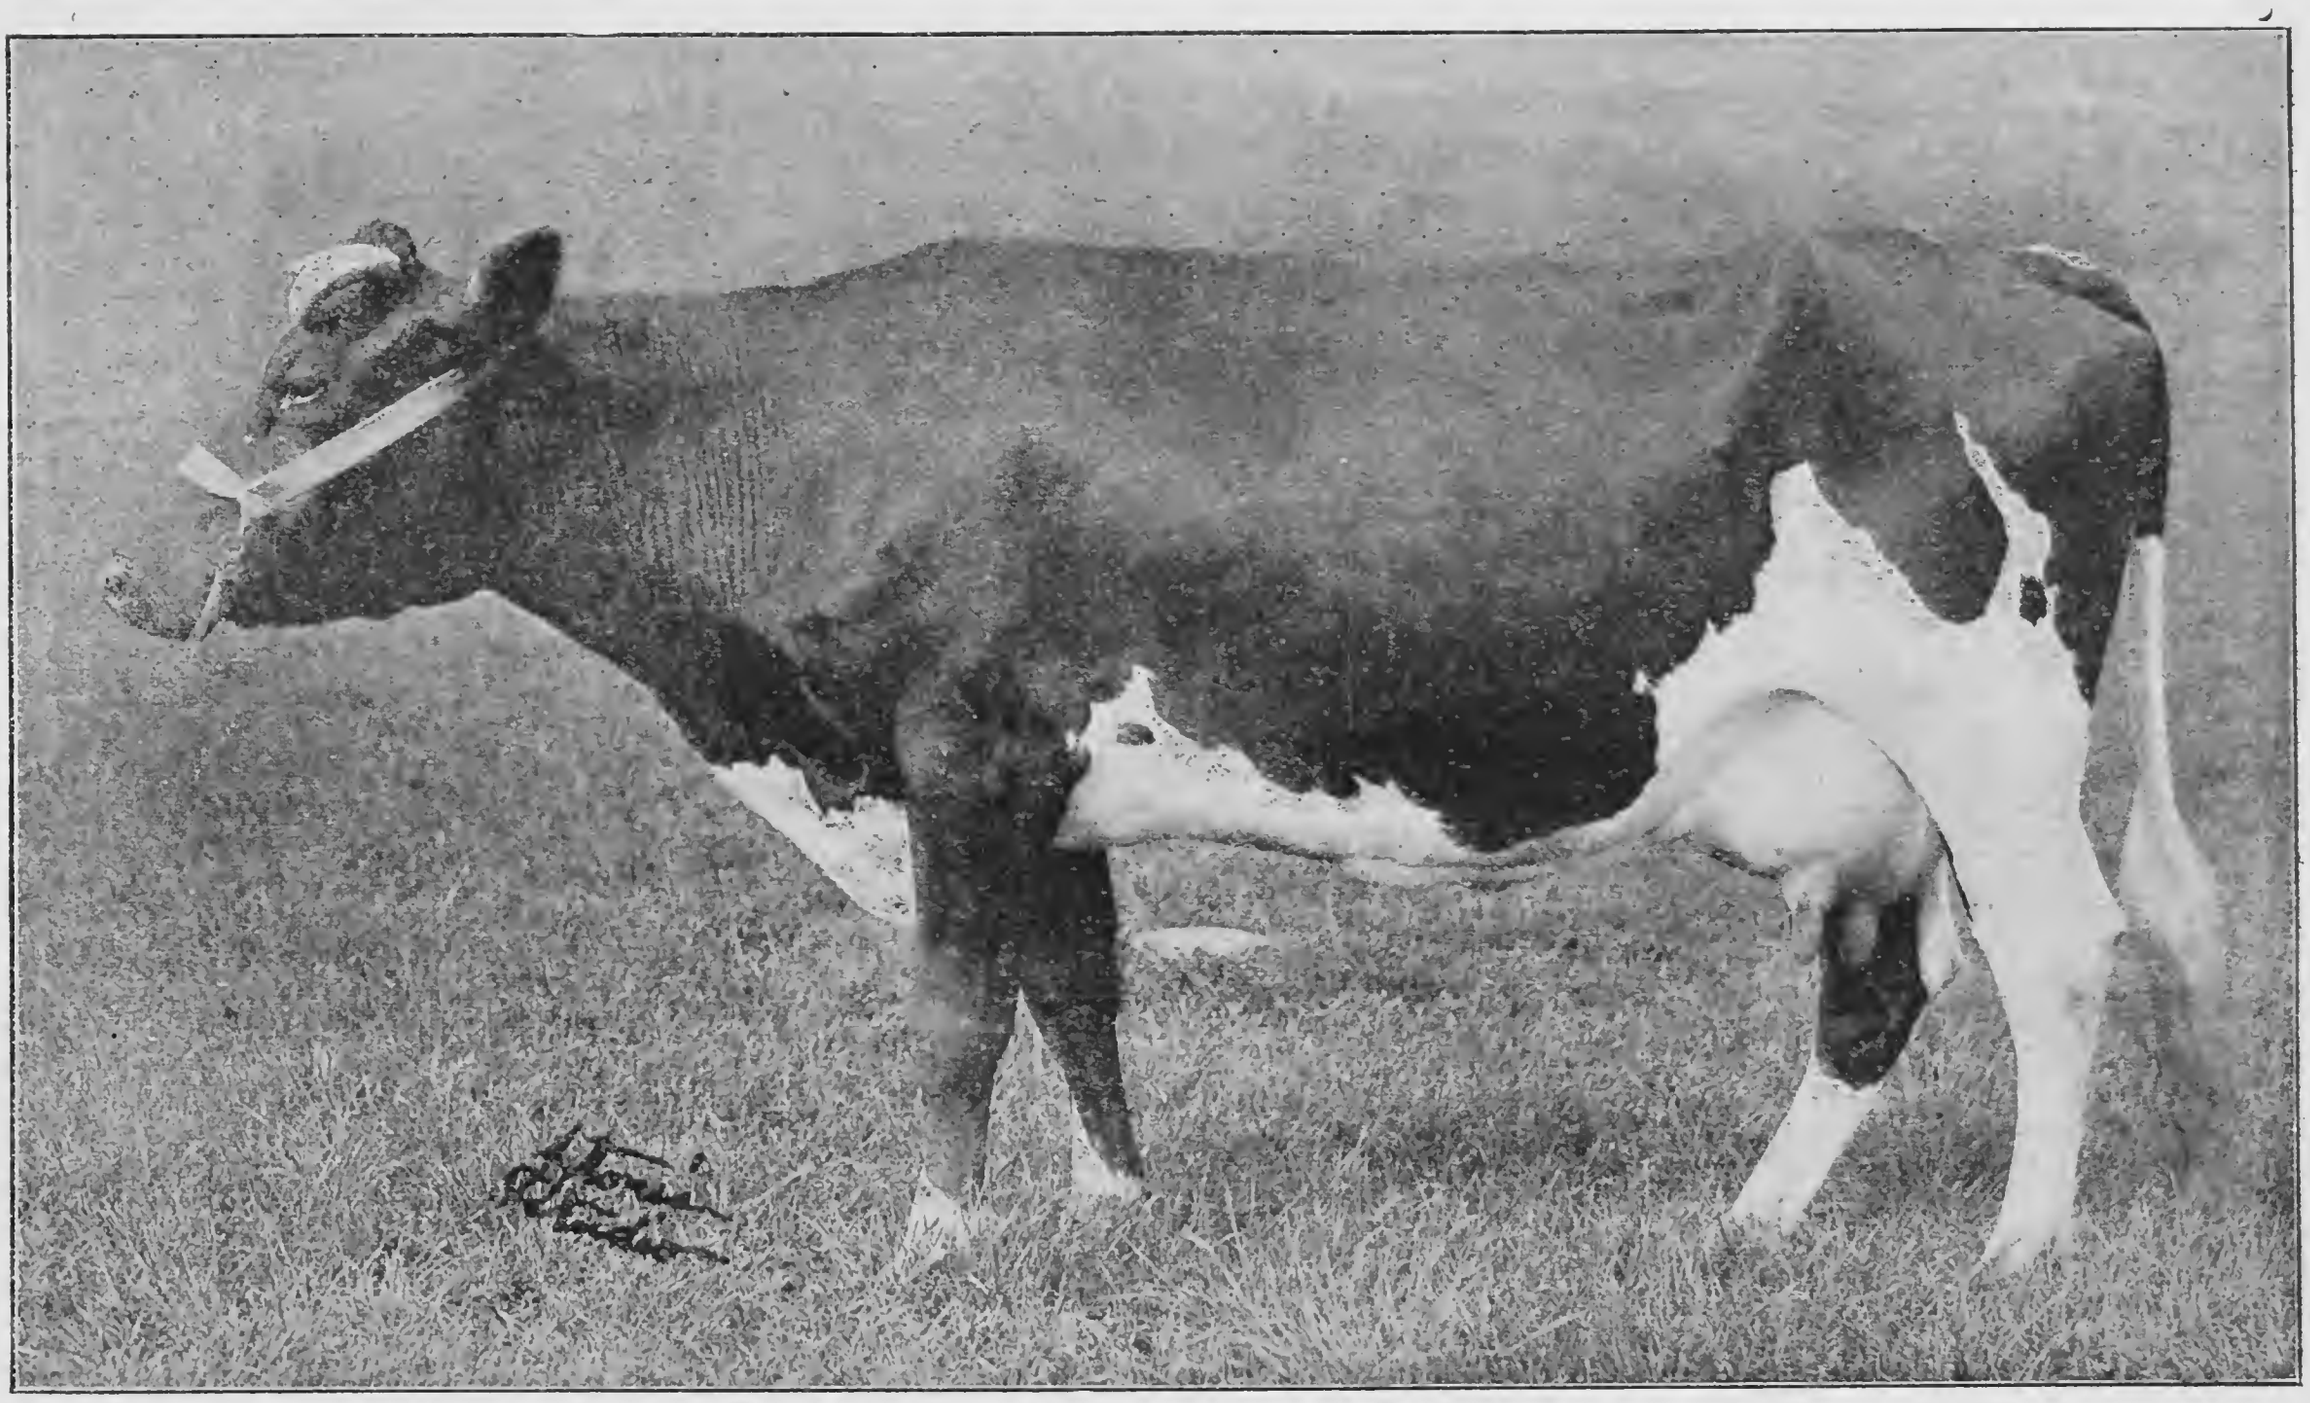
Looking the Animal Over.

Will you tell us what to look for in a Holstein cow in order to pick out her show points?

PRINCIPLES OF EXCELLENCE.—What are the "show points" of a Holstein cow? Well, that is something of a question as to who the judge is going to be. No animal will win first prize at all of the shows for the simple reason that the same man does not always act as judge. So let us see if we cannot reason the thing out among ourselves. In the first place, the Holstein cow is a *dairy* animal. Some of her more ardent admirers go so far as to claim that she is a dual-purpose animal. But I think these men make a mistake. For when a Holstein cow possesses dual-purpose qualities she is not an ideal Holstein. You may rest assured that she is not so good a dairy animal as she ought to be, and I think that it would be better for her owners to keep her in the background, breed her to a bull of pronounced dairy type in the hopes of getting some heifers from her that lack her "dual-purpose" qualities, and veal her bull calves always.

POPULAR IMPRESSIONS.—I can see right now that we are going to get into trouble in this matter of the show cow. The judge likes to please the crowd, and the crowd likes a handsome, smooth animal with plenty of flesh, which of course makes graceful lines, and really a thing of beauty. Nature abhors sharp corners and ragged edges. She goes in for curves and plumpness every time. But the modern Holstein cow is not a natural thing. She is the result of man's working for a long time to the back is taken into consideration, but I am change the course of nature and induce bossy to give milk enough to raise three or four calves, and keep it up long after the calves cease to need the milk. Man can change the works of nature, but he has to pay for what he gets every time. He can more fully develop one function, but it is always at the expense of some other function. That is the reason why a cow cannot be an ideal dairy animal and an ideal beef animal at the same time. If you will accept the foregoing as facts, I think we can now go about the job of analysing our Holstein show cow.

SALIENT POINTS.—In the first place, she must eat a lot of food, and for this purpose she must have a wide mouth with strong jaws. Here is a slap at the beauty idea right on the start. But the dainty, poor feeder will have the fine muzzle and the poorly developed jaw, and she is the cow we have no use for. If our cow eats a lot of food, it has to go somewhere. So she must have a lot of storage capacity. She must be of long body, deep and wide. Her ribs must be far apart—for a cow has only so many ribs anyhow, so if they form "slats" the length of her sides they must be placed a good way apart to reach. These ribs must also be well sprung; that is, they must be curved like a hoop. This, of course, makes more room for her several stomachs and other internal organs, not the least of which is the lungs. Then it is a pet phrase among writers on the dairy cow to say that she must be "wedge-shaped." That is all right if only afraid that those who do not understand the meaning of the phrase sometimes take it to mean that the cow should be flat or "slab-sided." By wedge-shaped we mean that she should be very wide at the hips, because there is to be a tremendous udder hung between her hind legs, and those legs must be well spread to make room for it. Then her back should taper along to sharp, thin shoulder tops, because our cow carries no superfluous flesh, and nature has as usual asserted her authority and taken off from one end what we have added to the other. The neck will, of course, be thin also, but wide—or, should I say deep—next to the shoulders and tapering nicely to the union of the head. The throat should be clean and not show enlarged glands.



THE HOLSTEIN COW "KUPERUS WALKER," No. 97457. 461.2 POUNDS OF MILK IN SEVEN DAYS. FIG. 329.

FURTHER CHARACTERISTICS.—The legs should be neat of bone and moderately short. But I think we should not expect too much in the way of short legs. We want a long back, long neck, long ribs and a long tail. Now isn't it asking almost too much of Nature to give us all of these and then place stubby legs under our cow? Of course Nature can do it if she wants to, for she has the dachshund to prove it; but I think that few of us will maintain that the dachshund's legs add very much to his beauty, and we will not strive for that type of cow. The cow's back should be straight clear back to the tail setting. A sloping rump shows weakness, and not only this, but we almost invariably get poor forequarters of the udder, with the teats

pointing towards the fore feet, with this type of back. The tail should be large at the base, and should taper nicely down to the end, which should reach the hocks or below. And I like to see a good, heavy switch, too. As one of our best dairy authorities once said, "A cow that hasn't vitality enough to grow a switch isn't much good anyhow."

UDDER AND HIDE.—The udder should be very capacious, but very flexible. Avoid a fleshy udder. The quarters should be all well developed, and the front ones should extend well forward. The teats should be placed well apart, and point straight down, and of course they are better of medium size. The skin should be of medium thickness, but very soft and loose under the hand, and mellow. The hair should be fine, thick and of an oily appearance. Now this question of the skin is not a matter of beauty alone. It is the only outward indication that we have of the inside lining or mucous membrane of the cow, and of course this has much to do with her function as a milk producer. Other outward indications of the inside workings of the cow are her milk veins. The nourishment is taken from the food and poured into the arteries, and is taken down to the udder on the *inside* of the cow. The milk is secreted by the udder glands from this arterial blood, and then the "used up" blood, as we might say, is sent back to the heart through the *milk veins*. If these veins are elastic, large and tortuous, we conclude that a great deal of blood is being sent to the udder for milk extraction, because a great deal comes away from it.

BOVINE BEAUTY.—I think that perhaps I have touched upon most of the really essential points, but there are a few "beauty marks" that will win favor. I like to see a pair of small black incurving horns. No horns at all are better than big, ill-shaped horns, and we sometimes have a suspicion that bossy might have had such horns before they were cut off. A large, full, placid eye helps mightily also. Such an eye shows not only health but a good disposition, which is very essential. It will profit you nothing, though your cow may give you 40 quarts of milk a day, if she kicks it all over you and the barn just before you arise from milking her. And but few men are so constituted that such conduct will not eventually tend to injure their good nature. Then the color really does make a difference. A Holstein may be dark, but I like a nice big star or shield of white in the face, the legs all white, a good part of the tail, and, of course, the switch. Then if the belly is white, and that color extends well up around the flanks, we have a very prettily colored cow. On the other hand, if she be light, I like to have the sides of the head and neck black, leaving a nice strip in the face. A few big spots on the body help also, but I do not like a speckled one. Perhaps the best color is the evenly marked cow with big spots, with possibly the white a little in preponderance.

J. GRANT MORSE.

THE COUNTY AGENT AND CO-OPERATION.

THE county agent's field is an exceedingly large one. His activities might be grouped under four heads:

1. To suggest to the farmer on his farm ways of handling his soil and managing his business so that he may receive more bushels or pounds for the labor and capital employed.

2. To help him solve the problems of marketing so that he may receive more dollars for what he produces.

3. Assist him in his purchases, so that those dollars may go further—buy more of the necessities and embellishments of life.

4. To help organize the forces of society so that country life may become as full and rich as we all believe it should be.

EXPERIENCE IN OHIO.—As thus outlined, co-operative buying and selling may assume large proportions in the association work, and is capable of almost indefinite extension as experience may justify. In Ohio we are feeling our way along, and work of this kind has been restricted largely to the purchase of commercial fertilizer. The history of this movement is as follows: Early in 1913 Mr. H. P. Miller, agent for Portage County, by placing an order for 1,000 tons, and paying cash on delivery, secured prices on fertilizers that saved the consumer over $4 per ton over the prevailing price paid for fertilizer. One or two other counties were given the benefit of Mr. Miller's contract, and the organization for the distribution of the fertilizer was begun. Men were selected at each shipping point in the organized territory who would receive orders from the farmers, and to whom the cars should be billed. These agents were to notify the farmers upon arrival of the goods, and assist in the unloading of the cars. For this service they received a commission of 75 cents per ton. The farmers were notified of the arrangements and requested to send their orders to the men handling the goods at their respective shipping points. Accompanying each order an advance payment of $2 was demanded, as a guarantee that goods would be taken and paid for promptly on arrival. In the face of all sorts of opposition and misrepresentation about 2,000 tons were placed for use in the Fall of 1913.

INCREASING BUSINESS.—The success of the movement was so pronounced that the entire output of the factory was purchased on the same terms for the Spring trade of 1914, and by the same system of distribution 20,000 tons of fertilizer have been placed in the hands of the farmers composing the organization at a saving of over $80,000. The volume of business has been so great as to outrun the capacity of the company through which we have done business, and some vexatious delays have been occasioned. The success of the movement threatens its failure. Plans are now under consideration to buy, if possible, the output of other fertilizer companies and greatly broaden the movement. If farmers will only work together it is possible to effect a still larger saving in fertilizers. Under a somewhat similar plan of distribution nearly $5,000 worth of paints and oils has been purchased by the Geauga County farmers with a saving to them of $600.

EXCHANGING PRODUCTS.—There is a big field for the exchange of products between farmers of different sections of the country. Green County, Ohio, produces corn and Alfalfa. Portage County produces potatoes, and Geauga maple syrup, and these counties are consumers of corn and Alfalfa. A number of cars of Green County's products have found their way direct from the farmer producer in Green County to the farmer consumer in Portage and Geauga counties, and Portage County potatoes and Geauga County syrup have gone to the consumer in Green County. The dollar in these exchanges has been unclipped save by the railroads. A quantity of clover and Alfalfa seed has been purchased from seed producing sections; this has been entirely satisfactory. Where county agents can give personal attention and inspection pure, clean seed is guaranteed.

REQUIREMENTS FOR DISTRIBUTION.—Some of the progressive farmers of this section are beginning to realize something of the fearful cost of distribution under the present system, and are clamoring for the coöperative purchase of all supplies. This seems unwise without suitable warehouses and equipment, a tried organization and business experience. If the movement can be held in check while these requisites are being built up and perfected, this phase of the county agent movement may contribute much toward the solution of the great problem of the age.

F. L. ALLEN.

A SENSIBLE COUNTRY MERCHANT TALKS

AFTER reading the articles on "The Local Store," on pages 618 and 739, I am incited to write a few words in reply. I am a farmer and always have been one, therefore my sympathies are with the farmer, but I am also in the mercantile business, so I know whereof I speak. The articles referred to above do an injustice to the average country storekeeper, and do not indicate a broad understanding of the conditions a merchant has to contend with. B says he can see no reason why the country merchant cannot sell as cheaply as anyone else. That statement alone would tend to show he had not used his reasoning powers. He also states that the mail-order houses are getting rich, which would indicate they are not selling too cheap. That is very true. Let us find the cause.

In the first place, all the reputable mail-order houses are backed by plenty of capital. They have an establishment valued at several hundred thousand dollars. They do a business of several millions. The capacity per unit for filling orders in a mail house is a hundredfold that of the country store whose clerk will spend an hour pulling down all the dress goods it contains in order to sell a customer a few yards, in exchange for a roll of butter that he will have to dispose of at a loss. The majority of mail-order houses fill your orders through outside firms. They have your money to pay for same, therefore get large discounts and concessions which we can never hope to get. I used to buy large quantities from these firms before I went into business for myself. Their prices are much lower, but when you take into consideration the quality, the loss of the use of your money for several weeks, the delay in getting them (on several occasions the goods were so long en route, I had no use for them when they finally arrived) the freight bills and the fact that the goods are not always what you expected, yet one does not want to go to the trouble of returning them, I don't think the average purchaser is much ahead after a term of years.

Right here is where the shoe pinches. Every country merchant carries all his customers some of the time and some of his customers all of the time, for the simple reason that every blessed cent the debtor can rake or scrape up he or she will fire into the city man and live on their obliging country merchant, who is forced to borrow money to hold them up. We are an independent race. I do not dispute the right of anyone to buy where he chooses, but would it not seem to be purchasers' duty, after carrying them through sickness and lean years, to apply the money they send away on their old accounts, thereby enabling us to sell to them cheaper, as we are compelled to tack these poor accounts on the selling prices, or go to the wall? If it was just the poor it would not be so bad, but a large per cent. of prosperous farmers with bank accounts and automobiles will not pay a store bill "till the last dog is hung." They say, "He is glad enough to get our trade, let him wait." Does my friend know of any merchant who for the amount of work, anxiety, risk, the capital invested, is getting any richer than he ought? Don't judge by appearances, but look on his books and note the thousands he is carrying from year to year; you will be surprised to see the names and accounts written there. The mail house runs no risk. Your local merchant risks everything. The expenses in proportion to the volume of business are not to be compared with his city rival. Don't kick your benefactor, but boost. If all advocates of mail-order houses would pay us for goods before they get them, we would quote you prices that would put our city brethren out of business. That is the only way we will all get our equitable division of the results of our labor.

New York.

HARVESTING GRAIN WITH POULTRY.

A YEAR or so ago there were several paragraphs in THE R. N.-Y. about letting chicks harvest their own grain. Last year we had a small piece of Winter wheat which we allowed some half-grown chicks from colony houses to harvest. We never had chicks do better. Later they helped themselves from a buckwheat field. We could devote six or eight acres to growing grain for feeding chicks in this way and it would be the most profitable way in which to use the land. Most of the straw would go back. We have wheat which was planted in the Fall, also rye, although I believe that rye grain is not good for young chicks. Is there a succession of grains that would give the chicks a continuance of feed from about the middle of May to the last of October? H. H.

Maryland.

We often have reports from people who turn a flock of chickens into a buckwheat field, and leave them to clean up the grain. This seems to give very general satisfaction. In some cases where considerable grain is grown, hens are kept in portable houses, which are hauled about in various parts of the field, leaving the hens to pick up the scattered grain. In this way the birds obtain a good share of their food, and the grain is saved. There might be cases where this plan of leaving hens to harvest grain crops could be followed out. We have never been able to get our hens to relish rye as a whole grain. They appear to dislike it, but will eat it fairly well in a mash, mixed with cornmeal and other feeds that they like, or when the rye is mixed with cornmeal and baked into a cake. The hens will probably not thrive in a rye field, but they will take care of oats, barley, peas or wheat. They could be started in the wheat field from a Fall seeding, then turned into oats and peas, then barley, and then finished off with buckwheat, pains being taken to seed these crops at intervals so as to make a succession of grains. Such a plan would not pay, except under rather extraordinary circumstances, but it should be worked out if desired. As is well known, in many parts of the West hogs are kept very economically by letting them graze or pasture a succession of crops. They may start with rye or wheat in the Spring, and follow through oats and peas and buckwheat, to corn and rape. In these cases corn is often planted in drills, and rape seeded at the last cultivation. The hogs are turned in when the corn is soft in the ear, and left there to clean up rape and corn, which they do successfully. Something of this plan could be followed with poultry, although we do not know of any cases where it has been actually carried out.

THE dwarf fruit tree suits the older man, for it is a giant at early bearing. For the young man it seems more like a toy.

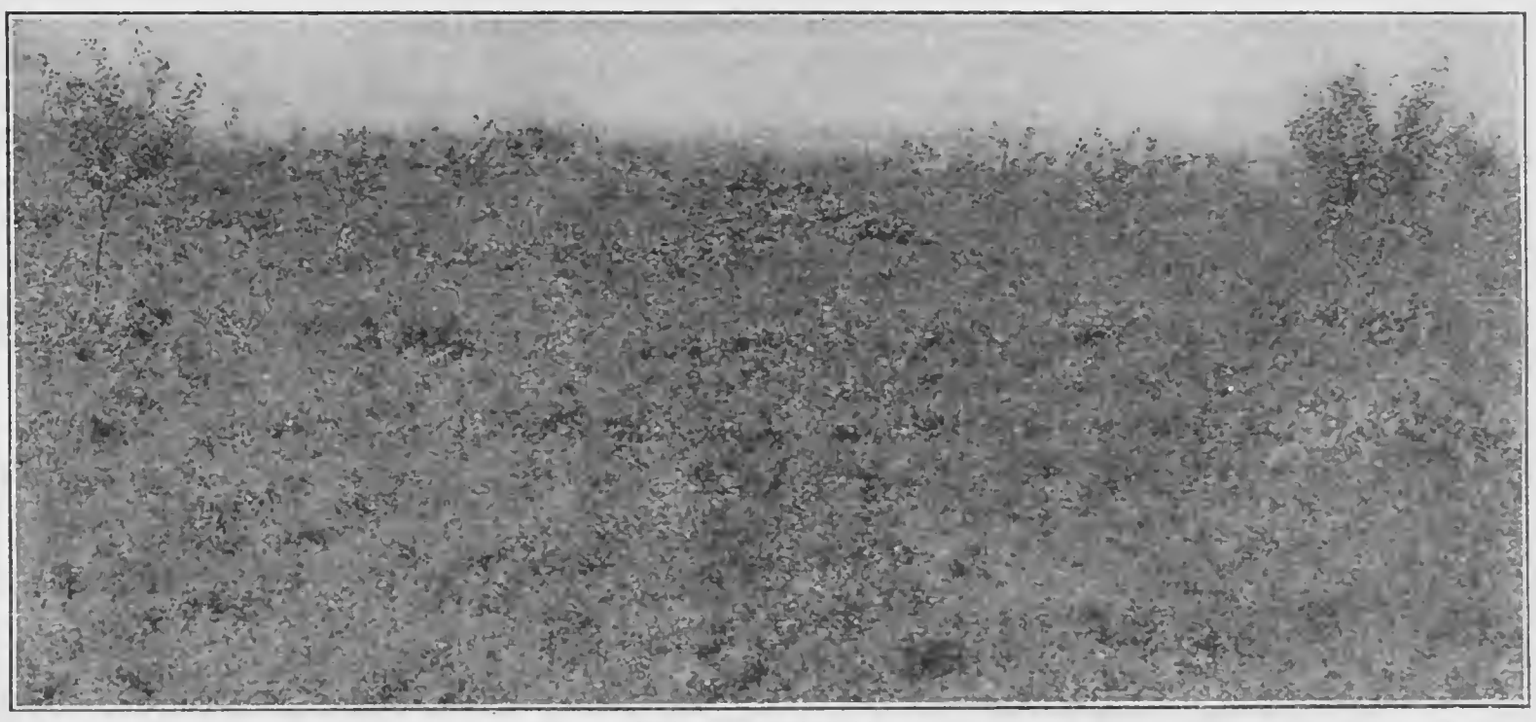
SCIENTIFIC PRODUCTION OF FINE APPLES.

From Plowing to Packing.

PART I.

IDEALS IN QUALITY.—It is the aim in this paper, the first of a series on apple packing, to discuss briefly some of the important points in securing good fruit. We all agree that the general appearance of the package has much to do with the sale of the fruit contained, yet sometimes fail to realize fully that the consumer is being rapidly educated to look beyond the external and place an increased value on the real quality of the fruit itself. It is a fact that a great deal of fruit which would best be sold in bulk is being handled in expensive packages, and the grower is often at a loss to know why he fails to get satisfactory prices, and frequently attributes it to dishonesty on the part of dealers. The frequent stagnation of the apple market, which is very discouraging, especially to the small grower who is not prepared to hold his fruit, is almost wholly due to lack of distribution, poor quality and faulty packing. Remove the latter two and distribution will be much facilitated, because it is so dependent on quality and packing. There is rarely if ever an over supply of good fruit, because people are willing to pay the price if they can only get a good article. Given any variety, the degree of quality will depend on how near it approaches the ideal for that variety in size and color, and upon its freedom from insect and fungus infections, bruising and other forms of mechanical injury. Uniformity in size, color and soundness are also important, particularly when fruit is to be packed in boxes. Of the many factors involved in securing the above, the most important are likely to be s o i l management—including fertilization—spraying, pruning and thinning of fruit. Failure properly to attend to any one of these, no matter how w e l l all others may be looked after, u s u a l l y means failure to realize full returns from the effort and expense involved.

ALFALFA AS A PERMANENT SOURCE OF MULCH IN APPLE ORCHARD. FIG. 330.



HAIRY VETCH COVER CROP IN A YOUNG ORCHARD. FIG. 331.

SIZE OF FRUIT.—The s i z e of fruit is largely dependent upon those factors which determine the amount of tree growth, viz.: moisture a n d fertilization. The former, however, is likely to be the m o s t important as w e l l as the cheapest and surest m e a n s of controlling size; in fact, moisture control is likely to be the m o s t important problem with which the orchardist has to deal. At the present time there are two systems of soil management available, either of which will meet requirements in this regard. These are tillage combined with some form of cover crop and sod mulch. Sod alone has failed miserably when carefully compared with these two systems, and except in a few special cases is hardly to be considered where more than average results are desired. Compared with tillage and cover crops, sod mulch appears to be somewhat the more efficient in conserving moisture; usually gives more tree growth, at least with young trees; tends to bring trees into earlier bearing, and may produce fruit of a little higher color. It is particularly adapted where the land is too steep or too rough for easy tillage, or on soils which are especially subject to washing.

SOD MULCH, as here referred to, consists of a permanent grass cover and the maintenance of a definite mulch extending from within a few feet of the tree trunk to somewhat beyond the tips of the branches. The material should not be brought up close to the tree because of danger of injury by mice, but in any case the mulch system should combine some form of trunk protection. This mulch may be secured by cutting and drawing up the grass and other growth from between the trees, supplementing this, if necessary, by sufficient outside material, such as swamp hay or straw to maintain a covering of several inches in thickness, or sufficient to keep down all grass and weed growth. The system is effectively started by allowing a rye cover crop to stand until it comes into bloom, at which time it is mowed and later drawn up to the trees. A permanent grass cover is easily started by sowing in the young rye, or after it is cut, as for clover or other hay crops. Tests at the Pennsylvania Station indicate that Alfalfa may be successfully used as a permanent cover and source of mulch, and that it is possible to maintain satisfactory mulch and tree growth, at least until the trees are in profitable bearing, and use one cutting per year of Alfalfa as hay. So far as operating expense is concerned, studies by the Geneva Station appear to indicate that sod mulch is at least no more expensive than tillage.

TILLAGE still remains a favorite means of orchard soil management, but if not practiced so as to insure a good soil or dust mulch it will prove little better than sod alone. Tillage should not continue later than mid-season, although this will depend somewhat on the amount of rainfall, the size of crop and the cover-crop used. During dry seasons or seasons of very heavy crops, tillage may continue a little longer. A cover crop should be sown at the last cultivation. If nitrogen is lacking, as indicated by scant, weakly tree growth, it is possibly best to use a legume, such as one of the clovers, vetch, or Soy beans, but where nitrogen is not needed or appears to be in excess, then rye, millet, buckwheat, rape or Cow-horn turnips will be cheaper and quite satisfactory. Rye has an added advantage in that it may be sown quite late in the season. Vetch appears well suited to use as a cover crop because of its low moisture requirements, comparative hardiness and ability as a nitrogen gatherer. The cover crop should be turned under the following Spring and before it begins to draw too heavily on the soil moisture. Deep plowing in any case should be avoided, particularly within the root area, and with old trees, or those which have not been cultivated for a number of years.

State College, Pa. R. H. BELL.

TWO EPOCH-MAKING DAIRY MEETINGS.

MY mind runs back to a February day in 1872, when in compliance with a call I had issued in the Wisconsin State press seven men met in the city of Watertown to organize a State Dairymen's Association. Very faint and feeble was that beginning. The total value of the dairy product of the State did not exceed a million dollars. To-day the value of the annual dairy product—cattle sales included—is over a hundred million dollars.

From that February day till now the Wisconsin Dairymen's Association has been the leader and guide of the industry every hour of the time. Out of it have come some of the most potent educational forces of the State for the promotion of a more enlightened agriculture, among which I would mention the Dairy and Food Commission, the Farm Institute, the Dairy School. The College of Agriculture itself has been greatly nourished and built up by the powerful influence of this association, which in its advocacy of wise laws, in its defence of sagacious measures, in its absolutely non-partisan course, has been constantly respected as a great force working for the true advancement of the State. The proud preëminence of Wisconsin as a producer of dairy thought, dairy product, dairy cattle, and dairy machinery is due in a very great measure to this organization. "Behold how great a fire a little spark kindleth."

In 1881, while presiding at the session of the Northwestern Dairymen's Association at Lake Geneva, Wisconsin, I was waited upon by Mr. Knapp, assistant freight agent of the C. & N. W. R. R., and Judge Burchard, land commissioner of the same road, with the request that the Northwestern Association hold its next session at Mankato, Minnesota. These men stated that the farming interests of that State were in a deplorable condition through the ruinous effect of constant wheat growing. The product per acre had fallen so low, and the quality as well, that the railroads were threatened as well as the farmers with a ruinous loss of business. "Something must be done at once," said Judge Burchard, "to pull the Minnesota farmer and the railroad out of this hole. The farmers have heard of what the cow is doing in Wisconsin and Northern Illinois for your redemption. Your convention to-day convinces me that here is a great redeeming force if we could once set it at work in our State."

The result of the conference was that the Chicago & Northwestern and the Chicago & St. Paul railroads agreed to give free transportation to one hundred dairymen from Illinois and Wisconsin to Mankato and return, if the Northwestern Association would hold a convention in that city the next Winter. That convention was one of the most memorable in its character and final effect of any in my recollection, covering a period of over 40 years. The daily attendance of farmers was over 1,200 for three days. All of the speakers were practical dairy farmers, and their thought and advice shed such a flood of light upon the subject that hundreds of farmers made preparation at once to install the cow in place of the plow. The next Winter another great convention of the same organization was held in the same city. From the impulse thus started and the seed sown at these two conventions, the dairy industry in Minnesota at once took on definite shape and progress. Out of it came the right organization of forces, the passage of favoring legislation, the creation in the minds of the Minnesota farmers of a determined, definite purpose to prosecute the industry thoroughly and steadfastly. To-day Minnesota occupies a front place in the extent, and particularly in the quality, of all her dairy products. The value of her dairy products now exceeds that of any other branch of her agriculture.

These two present to my mind the most notable instances of the effect of concentrated thought and purpose in the promotion of advanced agriculture as shown by after results. They show with pronounced clearness the power of right ideas in the furthering of the prosperity of the farmer.

W. D. HOARD,
Editor *Hoard's Dairyman.*

MANY refugees from Mexico have appeared in the Gulf States—driven out by the revolution. Even should there be war between this country and Mexico these people would continue to come here for protection.

Growing a Crop of Mulch Material.

WHAT can be planted for mulching after picking strawberries from a bed made last year, occupying an acre, but a very poor stand? Material is to be cut and used on an adjoining half acre of berries set out this season. After cutting this material, what should be planted that would build up the soil and put it in condition for berries again in a year? J. E. H.

Franklin Co., Ohio.

Here is a plan which has been successfully carried out by a number of Eastern growers. As soon after picking as possible plow the ground, turning the strawberry vines and weeds completely under. Then make a heavy seeding of Japanese Barnyard millet, after fitting the ground thoroughly. We should use 30 pounds of seed to the acre. If the soil is not in the best of condition, a small quantity of fertilizer will pay with the millet seed. This millet, when properly grown in a fair season, makes excellent mulching material. The stems are large and coarse, and protect the berries better than ordinary straw, and a heavy seeding of the millet will smother out most of the weeds and give clean mulching material. This can be cut just before the seeds form in the millet, and stacked ready for use at mulching the strawberries. As soon as possible after cutting the millet, work up the land again and sow to rye. If this can be done around the first of September, add 15 pounds of the seed of Hairy vetch to the rye. If cutting the millet is delayed longer than that, we would not advise sowing the vetch so late, but would add to the rye half a bushel of barley, and 1½ pounds of Dwarf Essex rape seed. The barley will make a considerable Fall growth along with the rape. They will be killed out through the Winter and afford a protection for the rye, which will come on and give a good growth in the Spring. Then by plowing under this rye when about two feet high, and packing the ground down hard, you will have a very good preparation for another crop of strawberries.

Why the Hired Man Left.

"I COULDN'T learn anything where I was at work, is the reason I quit." That was what a hired man told me a few days ago, and after he had explained, I was satisfied that he had sensible reasons for leaving the farmer. The young man told his story, and a good many of us should take notice, or the help problem will become more unsolvable each year.

"I read what I could," said the young man. "I observed and inquired, and in spite of having had the opportunity of going to school only three or four years at the most, I made the best of my meagre opportunities. I tried to pick good places as I shifted from pillar to post. I worked at several good places. I learned many things, but I learned much more by reading, and in this the last place which I left would have proved a handicap to my progress. I am interested in purebred stock, and the farmer for whom I worked was disinterested, he was absolutely ignorant about breeds, the selection of a sire, the judging of a dairy cow, and of feeds and feeding. He fed hay all Winter, and aimed to have the cows come fresh on June grass pasture. I tried to talk silo to him for the coming corn crop, but he seemed well supplied with those old arguments that were passed around in the country store a dozen years ago opposing the 'cyclone catcher.' He said it didn't pay to feed his cows, he declared his barn was as handy as any in the neighborhood. I disagreed with him on this point. The stables were divided by hay bays, hay was hauled from stacks in the field to the barn and then carried in for feeding. In fact I had no chance to learn. I had to do chores until late at night, and my time for reading was cut down to just the few moments at bedtime in which I was able just to keep my eyes open. Everything was against me, and I gave notice that I would quit. I did it. There are a good many young fellows who just want to put in their time, who don't care to get ahead, and with these it makes little difference whether or not they accomplish results just so they pull across the cash from the boss. These are the fellows who will work for a boss of that sort until doomsday, and then rent a farm and go on the same old way. I flatter myself that by reading I have learned a mighty lot and I consider that I have the privilege of choosing my employer, and this is as sacred right of my own as the boss has in discriminating in the matter of hiring help."

I found that this young man has a remarkable store of good sensible information about farm work, and I would match him his fund of knowledge against that of many farmers twice his age. When he tells me that it pays the hired man to choose his boss I think he was right.

W. J.

Farm Woman Wants a Job.

I AM an American woman and wish to learn more general farming. Poultry I understand, but the use of up-to-date machinery and the raising of general crops I do not. I am a thorough housekeeper, taught school a few years ago, and understand buying in large quantities. Considering what I know, can I get a position on a good general farm? I own a small place, but do not feel that I can handle it, unless I know something more than raising chickens.

New Jersey. MRS. A. J. K.

It ought to be easy for such a woman to obtain a position, provided she is willing to do some housework. Most farmers seem to object to taking helpers except at a strict basis of hired service. When "learning how" is part of it, the farmer is more likely to think that *he* ought to be paid rather than that he should pay the laborer. In the case of this woman there should be little trouble in her securing a place on a first-class farm.

Septic Tanks.

WILL you give me some information in regard to septic tanks for sewage disposal? Are the metal tanks satisfactory? On a large place (three acres) would it be all right to discharge the effluent on to surface 30 or 40 feet away from tank, 50 or 60 feet from house, without nitrification bed?

Wellesley, Mass. F. K. B.

I know of no reason save lack of durability why metal septic tanks should not be satisfactory; the advantages of concrete are such, however, that I should prefer it. Surface discharge from a septic tank would be more or less offensive near a dwelling and it would be far better to dispose of the effluent through drain tile laid a few inches beneath the surface. Such tile may be laid deep enough to plow over and the land is not kept from other use, while all sewage is out of sight. M. B. D.

Slippery Concrete.

IN putting down a cement floor in my barn, my contractor, contrary to instructions, made it too smooth, and in consequence it has become slippery and dangerous for our horses "the stalls are planked). Do you happen to know of an inexpensive method of roughing the cement floor? H. E. T.

New York.

A concrete floor that is made, or has become, too smooth for safety may be roughened by suitable tools that are made for that purpose; a hammer similar to a stone cutter's hammer, but with a corrugated face, being commonly used. I know of no easier method of accomplishing the desired result. M. B. D.

Refusal of Medical Services.

DOES a doctor who refuses to go to a sick person at night, have a right to practice his profession I sent a rig for him and would have taken him to the house and back, but he said, "he did not go out at night." I asked him if some one were dying if he would not go, but he cut me short with a "good-bye." It is surely an odd thing if a doctor can hang out his sign and practice but just go when he feels like it. J. D. S.

New York.

A physician is under no legal obligation to attend a patient whom he does not desire to attend, though, having once undertaken to care for a sick person, he may not break an implied contract for the necessary services by deserting the case without giving ample opportunity for a substitute to be obtained. A physician's license to practice medicine is not in the nature of a granted privilege, by virtue of which, society is entitled to his services; it is rather a restriction, required by society to protect itself against incompetent practitioners. No one may practise without it, but no one is compelled to practise if he possesses it. The present tendency in legislation is to discriminate against regularly licensed physicians by permitting the adherents of various irregular cults to practise medicine without requiring of them the same preparation for the work that is required of physicians of the established schools.

M. B. D.

Drying Peas and String Beans.

I WISH to try drying some peas and string beans this season. What is the best way? At what stage should the peas be picked? Should they be sun-dried in the pods, or shelled before drying? Can string beans be improved by picking just before pods begin to dry, on the same principle of curing hay? That is to say, would it be practical to pick the pods while in the mature, but still green stage, and shell them after drying in sun on trays; or would it be best to let them dry up on vines? Above for food, not for seed; the object sought being the dried beans, not pods. J. C.

Robinsville, N. J.

The drying or dehydrating of peas and string beans is a comparatively new industry with the processes that have come into being in the last few years. The method of preparation is applicable to all fruits and vegetables. Both peas and string beans should be dehydrated while in the young, tender stage. A tough, fibrous vegetable before drying is the same tough vegetable when processed. The peas are always shelled. The strings are taken from the beans. Aged stock does not make nearly so satisfactory dried product.

The peas and beans or other vegetable when prepared are placed in sanitary cabinets, where they are subjected to a warm, dry air, in which they are dried, the temperature never exceeding 160 degrees Fahrenheit. The vegetables are distributed on trays in the cabinets and the average heat should be 140 degrees for three hours when they are finished. During the dehydrating process the cell structures and the food values remain undisturbed. Upon soaking them in cold water for a short time, they return to a perfectly fresh green condition. A machine has been devised that enables the operator to do quicker work with less heat by the employment of moving air within the cabinet. The air in the machine is standardized by a pre-cooling and then heating system, so as to secure a continuity of operation regardless of atmospheric conditions, the capacity of the machine being maintained at all times. With some of the older methods of evaporation requiring high heat pressures the cell structures are broken down and the vapor carries off much of the food value. At Webster, N. Y., this new process has reached quite a commercial development. Pumpkins, corn, and a wide variety of the products of the garden and orchard can be thus treated by the new system. Season before last, during the plethora of onions, tons of the tear makers were dehydrated for use in the U. S. Navy.

A. H. P.

EXPLODING DYNAMITE WITH BATTERY.—Have any of your readers had any experience in exploding dynamite with a battery box from a gasoline engine? I wish to blast out some short ditches where it is necessary to fire a number of shots at once, but do not want to go to the expense of a blasting machine. They cost from $12 to $17. G. H. S.

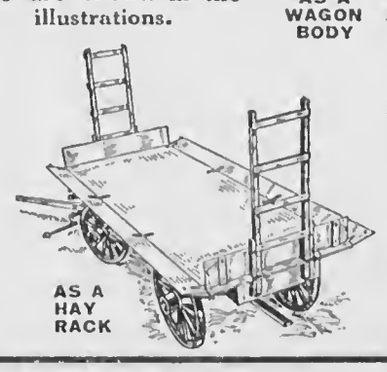
THE RURAL NEW-YORKER
333 W. 30th St., New York City

THE SALISBURY & BRACKETT
Platform Folding Hay Rack and Wagon Body

Increases the usefulness and capacity of your farm wagon. It is a combination of strength and simplicity and is easily convertible into an ideal wagon for almost any purpose. Some of its uses are shown in the illustrations.

Its capacity as a wagon box is from 22 to 24 barrels; or in bulk, 75 bushels.

As a stock rack its width allows of drawing nearly double the usual number of calves or sheep.



JOHN MURPHY
Holley, N. Y.

DON'T FAIL TO SEND TODAY FOR DESCRIPTIVE BOOKLET TELLING MORE ABOUT THIS WAGON BODY

Rye and Timothy for Hay.

LAST Fall I worked a piece of oat stubble up well with Cutaway harrow and sowed to rye with good seeding of Timothy and clover. The rye is now heading out and among it there is quite a heavy growth of quack grass. Would it be better to let all grow and ripen and get what grain and straw I can, or would it be more profitable to cut all for fodder? How near ripe should the rye be for fodder? Would such fodder be safe to feed to dairy cows?

Wright, N. Y. S. W. C.

With us it would depend on how badly we needed the feed. If short of hay we would cut the green rye and cure it. Rye is the poorest of all the grains for making into hay. It is tough and hard, and stock do not eat it as well as they do oats or wheat, when dried. If cut for this purpose it should not get past the bloom and would better be cut as the heads are forming. Unless there is need of the green rye as hay we should let it mature into straw and grain.

The Emergency Auto Truck.

THE picture shows a quite common happening on a New York street. A broken axle has stalled the load of lumber on a street car track, and the car company's "emergency" auto truck is there to remove the blockade. The wagon is

A BREAKDOWN ON THE CAR TRACK. FIG. 333.

jacked up enough to get a two-wheeled truck less than six inches high under the broken axle, and the load is then hauled to one side of the track by the horse, or auto power if necessary. The horse is taking the resting spell philosophically, and perhaps reflecting that putting a two-horse load on a one-horse wagon is poor practice.

Field Stone for Building.

IN many parts of the best dairy regions of New England and New York the removal of loose field stones is necessary after every plowing, and their disposition becomes a problem. Would it not be practicable to use these stones for smaller outbuildings, and perhaps even for stables and houses? Could such buildings be built cheaper than those of concrete, and could they be so built that they would not be damp? Is there any literature upon this subject of erecting such buildings? I hope to return to my old home in Delaware county, N. Y., in a few years, and the subject is of much interest to me. C. W. B.

Washington, D. C.

Considerable stonework is being done for country building. In our own neighborhood several large buildings have been erected in just the way you mention, using the waste stone from the stone wall, or when picked up on the ground. Many farmers take great pride in building houses of this sort, and we think the practice is growing. The best way to get hold of this matter is, as usual with such questions, to call upon our readers for experience. We have no doubt that we shall find many who have built these houses, and who can give us practical details about it. We want to know the comparative cost of such buildings, how much of the work could be done by the farmer and his hired help, in fact any practical information which would help such a man as the writer of the above to understand the business thoroughly. We expect in this way to obtain just the information these stone builders need.

DRIVING MOLES AWAY.—Seeing some of THE R. N.-Y. readers were wanting to know how to exterminate moles I will give them a remedy. Get lime or lye and dig a hole in their runs and put it in and plant castor beans around; they will soon get rid of the pests. We were troubled with them all last Simmer.

Holyoke, Mass. E. H.

LEGAL MATTERS.

Line Fence Trouble.

I HAVE two neighbors; I will call them A and B. A and myself each builds half of all line fence that is required. B and myself have a cow pasture opposite each other, and he claims that his part of the line fence is where there is not any alongside of our meadows. I have purebred Ayrshires and he has a grade Holstein bull. He claims that if this bull gets into my pasture and does damage he is not responsible, for he would get through my fence, until after his bull is two years old. What is the law about the line fence, and also in regard to the bull matter. J. M. L.

New York.

It is hard to understand how the age of the bull affects this matter in any way. If he is liable for damage, he would also be before, the bull was two years of age. The law provides that each owner of two adjoining tracts of land shall make and maintain a just and equitable portion of the division fence between such lands, unless one of them shall choose to let his lands lie open to the use of all animals which may be lawfully upon the other's lands, and does not permit any animals lawfully upon his premises to go upon lands so lying open. If you cannot come to any understanding with your neighbor as to which part of the fence each of you is to maintain, you will not be able to settle disputes, and you would be liable to your neighbor for the injury caused to him by the trespassing of your stock on his land, and he in turn would be liable to you if his stock broke through the fence; so the best precedure would be to have your difficulties settled by the fence viewers of the town as quickly as possible. M. D.

Outlaw of Claim.

When is the following bill outlawed or not collectable? A, living in Connecticut, buys some goods from B, who lives in Illinois, in December, 1907. A makes several payments on the bill, the last payment being made in May, 1909, and owing to a disagreement A has not paid anything since on the bill. When will this bill be outlawed or not collectable? Would it come under the Illinois law or the Connecticut law? W. A. O.

Connecticut.

The law of Connecticut would probably govern in this case, as B would probably bring an action in that State if he attempted to collect the bill. The limit on matters of this kind is six years in Connecticut and 10 years in Illinois, and the six years would run in Connecticut from the date of the last payment made by A, and unless some payment is made or promise to pay in writing is made by A, the bill will be outlawed in May, 1915.

Old-age Pension; Increase of Assessment.

(1) An old soldier was born April 25th, 1840. He will therefore celebrate his seventy-fifth birthday this year. Will he be entitled to the old age pension which is allowed at that age, or would he have to wait another year? (2) Can an assessor increase the valuation of a farm property without consulting the owner of the same. There has been no improvements made since the appraisal last year, but the taxes were raised so there was a dollar more taxes to pay on a seven-acre plot, and the assessor did not call on the owners. E. K.

(1) For the purpose of obtaining the pension the soldier will not become 75 years of age until April 25, 1915, and he will not be entitled to an old-age pension until that time.

(2) The assessors may increase the valuation of farm property without consulting the owner of the farm. It may be that the tax rate has arisen, instead of the assessment increased. If you wish to have your assessment reduced the assessors give a hearing to all those who wish it on the third Tuesday of August in each year, and you can make your complaint at that time.

Autocars Reduce Hauling Costs of Farm Products

Albert Hansell and W. H. Adams Tell of Advantages of Quick and Economica Motor Equipment

ALBERT HANSELL, a prominent farmer and fruit grower, of Burlington, N. J., bought an *Autocar* in February, 1911. In discussing it recently, he said:

"I bought the car because I became convinced that hauling my fruit to market with horses and wagons was too expensive. After several years of service with the *Autocar*, I know now that I was right. The car makes three trips to Dock Street, Philadelphia, 15 miles distant, in a day, while a team of horses is making one. And horses, after such a trip, have to be rested up the next day.

"My *Autocar* often makes three trips to Trenton and back in a day, a total distance of 120 miles. Since I have had the car, it has travelled more than 32,000 miles without a serious breakdown, and has added greatly to my profits thorough the quick marketing of my goods."

W. H. ADAMS, another Burlington County, N. J., farmer, says of his *Autocar:*

"The results have certainly been beyond my expectations. I use the car to haul my fruit, garden truck, etc., to the markets at Philadelphia and Trenton. Several times a week I make three trips to Philadelphia and return, 90 miles in all, in a day. One trip a day is the limit for horses. It means a great deal to a farmer to get his products to market quickly while prices are good. My *Autocar* has been a revelation in this work, and its reliability and economy have surprised me. I could not afford to be without it. It is easily handled and taken care of, never breaks down on the road, and has been a first-class vestment in every respect."

The Autocar

"Used in Every Line of Business"

The AUTOCAR has proved itself the most convenient and dependable motor truck for farm work and for average country roads. Write us today, Dept. "R"

GOOD PROTECTION FROM FIRE, LIGHTNING, RAIN AND STORMS is assured if your buildings are covered with

APOLLO ROOFING

APOLLO Roofing and Siding Products are highest quality, full weight, easily applied, reasonable in cost. Made from the well known APOLLO BEST BLOOM Galvanized Sheets, and sold by weight by leading dealers. Write for our free booklet "Better Buildings" giving full information.

AMERICAN SHEET AND TIN PLATE COMPANY, Frick Bldg., Pittsburgh, Pa.

Blast the Subsoil —Get Bigger Crops

You're *now* using only the *top foot* of your ground. Below the plow-cut the soil is rich in mineral plant food. Make this subsoil productive! Break it up with Atlas Farm Powder and get four or five feet of crop-growing fertility. The extra profit from one year's increased yield will more than pay the cost.

Atlas Farm Powder

THE SAFEST EXPLOSIVE

—easy to use, low in cost, and sold by dealers near you—has made thousands of worn-out farms rich, fertile and profitable, and thousands of good farms better. Punch holes into the subsoil, load, fire and the work is *done!*

Any intelligent man can use Atlas Farm Powder without experience or risk. It is the cheapest and fastest farm hand for blasting stumps and boulders, digging ditches, and making most satisfactory holes for tree-planting.

Get the New "Better Farming" Book—FREE

Our new illustrated book, "Better Farming," tells how you can make more money and protect your crops from drouth by using Atlas Farm Powder. It shows the economical way of doing many kinds of work on the farm. Mail the coupon and get it FREE.

LATE-PLANTED TELEPHONE PEAS.

RECENTLY a reader in Maine related his plan of planting Telephone peas late in the season, so as to obtain a succession of peas through the Summer and Fall. Usually late-planted peas fail, and this statement about Telephone has aroused much interest. Here are a few comments:

If anyone in this climate has said anything of the sort about the Telephone or any other English pea I would have said at once that he was mistaken. But what may be done in the Maine climate is another thing, and I cannot undertake to contradict it. I can plant peas here in August and have them bear till frost, but it is not a continuous bearing, for the one crop will just about bring them to frost. Just now is about as late as we can get any pea to make a single crop here, that is planted the middle of April. But by planting in deep open furrows in August and working the soil to them, we can make a Fall crop. Planted in July I do not think that here we could make any crop at all. We must wait till the nights get longer and cooler. I plant Premium Gem and other wrinkled peas in August, and seldom fail to make a crop, but only the same one picking that we get from planting in February.
Maryland. W. F. MASSEY.

We never plant wrinkled peas as early in the season as we do the round peas, because we find the wrinkled pea much more likely to decay in cold wet soil than the round sorts. We have never tried the Telephone pea planted in July three or four inches deep, as is the practice of your Maine reader, but I have seen the Gradus planted under much the same conditions, and it failed to stand the intense heat which almost always comes in August. Perhaps the Telephone could stand more heat, but I rather doubt the practicability of such late planting for our part of the State. TRUCKER, JR.
New Jersey.

While I have not personal knowledge of the fact, yet I should not doubt the statement of your correspondent as to his success in late planting of garden peas of the Telephone type. While the peas would mildew here, yet in cooler climates like England, and I think also in Maine, they would continue to produce pods throughout the season until killed by frost. W. ATLEE BURPEE.

It has not been our experience that late planting of Telephone peas will give a continuous crop or result as described in your letter. We suspect that your correspondent in Maine has drawn a general conclusion from a specific incident.
D. M. FERRY & CO.

The Telephone is one of several varieties of tall growing, wrinkled peas, and usually should be planted slightly later in the Spring than is the case with such varieties as Alaska. Under New York conditions, however, the plants do not succeed when planted late, becoming stunted and subject to mildew and are under such conditions unproductive. It is very unusual to have this variety succeed well when planted late.
Geneva, N. Y. O. M. TAYLOR.

Harrowing to Beat the Crows.

I HAVE noticed the discussion in your paper of the various ways of preventing crows from digging up seeded corn. For the past three years I have harrowed the field, with a spike-tooth harrow, with the teeth set well back, immediately after planting. This does not displace any of the corn, contrary to the predictions of my neighbors. I do not believe the crows have found a single hill after the harrowing until the corn plants have shown up above the ground. I plant the corn from four to five inches deep, and keep the harrows going over it about twice a week, or oftener if there are showers. This keeps about a three-inch mulch on the surface, makes it easy for the corn to come up and practically eliminates all the weeds. This deep planting makes the corn three to four days later in coming up; but by that time it is so firmly rooted and the substance of the kernel so fully consumed by the growing plant, that the crows do not apparently find it worth while to pull more than a very few hills. Last year, as near as I can estimate, there were 40 hills missing in 11 acres, or less than one in a thousand. The labor of early harrowing is many times repaid by the saving of cultivation and hand hoeing later in the season, not to mention the conservation of the moisture. W. A. W.
Hurley, N. Y.

"Sewage Disposal for Country Homes."

A BULLETIN of special interest to those confronted with the problem of sewage disposal in rural homes has just been issued as No. 59 of the Cornell Reading Course for farmers. This bulletin describes in detail the construction of modern septic tanks and also gives plans for building earth closets, sanitary privies, and chemical tanks. It is especially complete in its description of septic tanks, giving considerable space to the principles of their construction and rules for locating and laying the necessary system of purifying tile. This bulletin may be obtained by any resident of New York State by addressing the College of Agriculture, Department of Rural Engineering, Ithaca, N. Y. M. B. D.

EVENTS OF THE WEEK.

DOMESTIC.—The tornado which swept across northwestern Iowa, June 6, killed seven persons and injured a dozen, some seriously. Property damage in Sanborn is estimated at $150,000. Two elevators, the city tower, the electric light plant and a lumber yard were swept away.

Snow fell at Boise, Idaho, June 6, the first ever recorded by the Weather Bureau for June in its 50 years of operation there. In addition to this phenomenon the day was the coldest on record for June, and the mean temperature was the same as was recorded on January 5.

Fire in the North Burns Block, in North Street, Pittsfield, Mass., June 7, spread to several other buildings and caused a loss estimated at $150,000.

Fire trapped 100 persons in the tenement at 90 Essex Street, New York, June 10. Eight are dead and seven in Gouverneur Hospital were recovering. Others were hurt less seriously. The blaze started in rubbish in a closet under the floor stairs.

During a gale which swept Chaleurs Bay, between New Brunswick and the Gaspe coast of Quebec, June 4-5, it is believed that between 100 and 125 lives were lost during the two days. The victims were fishermen, and a particularly sad feature of the tragedy is that in most cases more than one member of a family was taken. The Chaleurs Bay fishermen ply their craft in families, the father owning the boat and his sons sailing with him as assistants. The 250 fishing boats sheltered in the Gaspe harbor were destroyed, being torn from their anchors and dashed to pieces on the rocks. The loss to the fishing boats and to buildings wrecked along the shore will exceed $500,000. The boats were nearly all equipped with motors and these with all the fishing tackle were destroyed. This means a terrible loss to the Gaspe population, which largely subsists by fishing. The steamship Canada of the Gaspe line nearly foundered in the bay and was so badly damaged that she will have to be dry docked. There was a heavy snowfall all along the Gaspe coast. Ice an inch thick formed in ponds and snow had to be shovelled from the line of the Gaspe railway at several places.

FARM AND GARDEN.—The annual meeting and show of the American Peony Society was held at the Art Institute, Chicago, June 9-10.

The twelfth annual convention of the Pacific Coast Association of Nurserymen was held at Vancouver, B. C., June 16-18, 1914.

The Summer Meeting of the Virginia State Horticultural Society will be held at the University of Virginia, Charlottesville, Va., on Wednesday, July 15, in connection with the Rural Life Conference of the University Summer School.

The Adams Express Company has opened a food products bureau in Philadelphia to bring producer and consumer together. The company will become a clearing house for excess production, disposing of fruits, berries, butter, eggs, poultry, fish, meats and other food articles at a minimum of expense to seller and buyer. The company is responsible to both, delivering the commodities to the buyer's door and the money to the seller without any intervening agency. The rate on the class of merchandise for which the bureau has been designed is 25 per cent. below the commercial rate fixed by the Interstate Commerce Commission and is no higher than parcel post charges.

Shower baths for hogs and other live stock in transit is one of the Summer innovations announced by the Baltimore and Ohio Railroad to add to the comfort of Summer travel. The baths will be provided at terminals and at resting stations when the animals are fed and watered. One of the purposes of the baths is to increase the road's dining car business by mitigating the odors wafted into passenger cars from cattle trains.

A party of 53 farmers, under the leadership of Johannes Adriaan Neser, member for Potchefstroom in the parliament of the Union of South Africa, left Cape Town, June 6, for England on their way to America, where they are to make a tour of investigation of agricultural methods.

In connection with the Summer school of agriculture at the Massachusetts Agricultural College, Amherst, June 30 to July 28, is a school for rural social service starting July 15.

The School for Leadership in Rural Life will be held at Cornell University, Ithaca, N. Y., June 23-July 3. Within the scope of the School are included courses in principles of rural sociology, social function of rural institutions, rural social engineering, the rural mind, rural personal ideals, applied rural psychology, principles of leadership, study of the individual, social organization, principles of rural economy, survey of rural economic conditions, coöperation, rural health and hygiene, rural recreation, psychology of the country girl, group organization for girls' work, rural social survey, extension teaching in agriculture—eighteen distinct courses in all, covering the whole general field of rural social science. The regular class work will occupy all of the morning periods. The afternoons will be given over to demonstrations, conferences, and pastimes, and the evenings to programs that combine educational and entertainment features. The lectures and demonstrations will be supplemented by a carefully selected and arranged country-life exhibit. Complete program of the school, including detailed descriptions of the courses, may be had on application to the secretary, A. R. Mann, College of Agriculture, Ithaca, New York.

COMING FARMERS' MEETINGS.

Massachusetts State Board of Agriculture, Annual Summer Field Meeting, Hood Farm, Lowell, Mass., June 24.

American Association of Nurserymen, Cleveland, Ohio, June 24-26.

Certified Milk Producers' Association of America seventh annual convention, Copley-Plaza Hotel, Boston, Mass., June 25-26.

School for Leadership in Country Life, New York State College of Agriculture, Cornell University, Ithaca, New York, June 23 to July 3, 1914.

Summer meeting, Virginia State Horticultural Society, Charlottesville, Va., July 15.

Summer school of agriculture and country life, Massachusetts Agricultural College, Amherst, June 30-July 28.

Annual Poultrymen's convention, Massachusetts Agricultural College, Amherst, July 22-24.

Georgia State Horticultural Society, Summer meeting, Griffin, Ga., August 5-6.

International Apple Shippers' Association, twentieth annual convention and apple exhibit, Copley-Plaza Hotel, Boston, Mass., August 5, 6, 7.

39th Annual Convention of the American Poultry Association to be held at Chicago, Ill., Augnst 8th to 15th, 1914, inclusive.

National Dairy Show, Chicago, Ill., October 22-31. The following meetings and conventions will be held in connection with the show: American Association Creamery Butter Manufacturers, Oct. 26. Holstein-Friesian Association of America, Oct. 26. International Milk Dealers' Association, Oct. 26 and 27. Conference, Secretaries of State Dairymen's Associations, Oct. 27. Official Dairy Instructors' Association, Oct. 27. National Dairy Union, Oct. 28. American Dairy Farmers' Association, Oct. 28. Council of the National Dairy Show, Oct. 28. National Association of Creamery Managers and Owners, Oct. 28. American Jersey Cattle Club, Oct. 28. National Association of Ice Cream Manufacturers, Oct. 28, 29 and 30. International Association of Dairy and Milk Inspectors, Oct. 29. American Guernsey Cattle Club, Oct. 29. Congress of Marketing, Oct. 29. Milk Producers' Association, Oct. 30.

Annual show of the Paterson, N. J., Poultry, Pigeon and Pet Stock Association, November 18-21.

Indiana Apple Show, Tomlinson Hall, Indianapolis, Ind., November 18-24.

Government Whitewash.

SLAKE one-half bushel of lime with boiling water, keeping it covered during the process. Strain it. Add a peck of salt, dissolved in warm water; three pounds of ground rice, put in boiling water and boiled to a soft paste; one-half pound of Spanish whiting; and one pound clear glue dissolved in warm water. Mix well and let stand several days. When used put on as hot as possible.

Soy Beans in Silage Corn.

ON page 698 (Hope Farm Notes) you advise against the use of Soy beans in corn. I live in the center of Dutchess County, and wish you had been at my place last Fall to see them grow, and the past Winter to see the silage fed to cows, and then the cows milked; you would have said by all means plant Soy beans in silage corn. I have planted Medium Green Soy beans three years, and where woodchucks and rabbits can be controlled have had good crops. They ripen here for seed. Neighbors have planted Soy beans, and are successful. One man planted them six or eight years. Everybody votes them a success, not only in growing, but in a big reduction of feed bills. I plant Early Mastodon corn (Delaware grown) and mix two quarts corn and one Soy beans and plant with planter. If thoroughly mixed I get a fairly good stand of both, corn growing 10 to 14 feet, and beans 2½ to three feet, and I don't think that is the end, for the next year's crop is very much better.
G. D. B.

MONROE COUNTY NOTES.

THE backword Spring has been succeeded by three weeks of beautiful weather during which the oats and most of the corn have been put in the ground. The spraying following the fall of the blossoms has also been done. But during all this time there has been practically no rain, and it is getting dry. Both grass and grain are showing this lack of water. In spite of a good start grass will be short unless there are good rains at once. Farmers who did not get their bean ground plowed early are now paying for it and will probably continue to do so throughout the season. The peach crop in Western New York is apparently doomed this year. As if the shortage of blossoms were not enough peach trees everywhere in the region have been visited by a terrible epidemic of leaf-curl. Practically every orchard sprayed as well as unsprayed has a 75 to 90 per cent. infection. Growers are giving two reasons for failure of the spray to protect against leaf-curl this year, the lateness of the application and lack of thoroughness. Instances are cited of very thorough and early spraying which kept the infection down to 10 or 15 per cent. For some reason apples have not set as they blossomed. Where there was a promise of an overload there will be only a fair setting. Plums have not set even as well as apples. This crop and pears will both be light. M. C. B.

Wheat $1.10 per cwt.; barley $1.10; rye $1 per cwt.; oats $1.25 per cwt.; flour $2.50 per cwt. Cows $45 per head, dairy cows $55 to $75; butter 20; cheese 18 to 20. Potatoes one cent per pound; apples one cent per pound; strawberries $1 per gallon. Eggs 20; chickens $4 to $6 per dozen. E. W. G.
Adin, Cal.

June 8. I am today working the corn with a 14-tooth cultivator. The weather is too dry and hot here, but we shall have perhaps more than an average crop of wheat, corn was never more promising, while oats and grass will yet respond to timely rains. Last week two light showers broke a three weeks' dry spell, and we are conserving moisture and wishing for more rain. W. E. D.
Hillsboro, O.

Corn 62; oats 34; wheat 80; Timothy seed $1.50 to $1.80; clover seed $6 to $8. Eggs 16; butterfat 20. Poultry, roasters, six; hens 12; broilers 13; turkeys 15; geese nine; ducks 10. Wool 14 to 18. Hides 10 to 11. Fat cattle $7.35 to $7.50; hogs $7.50 to $7.80. Hay $9 to $12, baled. Potatoes $1 to $1.10. No market for garden truck, too much shipped in from the South. These are the prices that the farmer gets. Very dry here now. J. S. S.
Cromwell, Iowa.

June 6. Asparagus 15 cents per bunch retail, wholesale 8½ to 12½; potatoes $1 retail, wholesale 71. Cows, fresh, $75 to $90 for good ones, others $50. Beef cows $45 to $60; 10 to 12 cents a pound dressed. Butter 30; milk, retail six cents, wholesale three cents, six months, four cents six months. Calves nine cents live; fowls 18 to 22 live; eggs 20. Young pigs $8 per pair. Rhubarb two cents per bunch. Hay $11 to $12 in barn, $18 to $20 in market. Strawberries 12 to 15 retail. A. E. S.
Factoryville, Pa.

June 6. This has been an unusually wet Spring and a good many of the farmers who are short of help and teams are somewhat backward in finishing their seeding and it has also held back the work on the highways. However, our town has a new 20 horsepower road roller and a heavy grader and we have turnpiked around 30 miles already in about 16 days, so if we are not shut off too quickly by the State now, will fix the roads fairly well yet. Grass looks fine and also grain that is up. Some of the farmers are busy planting corn and potatoes. Cows are high and scarce.
Farmersville, N. Y. R. S. H.

May 26. Harvesting and marketing what is thought will be the biggest strawberry crop ever grown on the Delaware and Maryland Peninsular has just commenced. Buyers from the North have arrived and paid as high as $6 per 32-quart crate for choice berries on the start. The Crimson clover crop which is also one of the largest on record, is being harvested. The weather is very favorable saving this crop. The weather is very dry, which is delaying tomato growers from setting their plants; the majority of growers have their ground prepared. An unusually large crop of cantaloupes has been planted. A large acreage of peas has been planted for the canneries; peas are beginning to suffer for rain. The outlook for the wheat crop is very good.
Dover, Del. C. H.

May 22. Price of beef has been about 8½ to nine cents for old cows well fattened, and good steers 10 cents per pound. Hides 13 to 15 according to condition and manner of dressing; 10 to 12 cents if sold in local market. Nearly all calves are fattened and shipped alive to New York. During the last year the price for prime live calves or veals has ranged from seven to nine cents; mutton nine to 10. Most lambs in this section are dressed, and sold in Ticonderoga (which is our nearest market). At the commencement of the season in August, 1913, dressed lambs sold for 14 cents per pound, but later and as the supply became more plentiful the price dropped to 12. I have never learned there was any drop in price to the consumer. Dressed fowls 20; chickens 25. In December, 1913, eggs sold for 40 cents per dozen to the markets and 45 to the consumer. Now they are 18 to 20 to the grocers and 22 to 25 to the consumer. The best price for prime butter to the producer was about 36; it is now about 30. Butterfat has ranged from 28 to 34; cows from $35 to $65. Hardly any fruit in this vicinity last year and not much market gardening done. S. W. C.
Wright, N. Y.

The Henyard.

Incubation Under Difficulties.

I WAS much interested in article, "Carbon Dioxide in Incubation," on page 713. I will give an incident that goes to prove the statement made therein, that "it is known that the chick embryo is able to withstand a wide variation of moisture and hatch," and also that some variation in other respects will not always cause failure.

Being unable to secure sitting hens in sufficient number this Spring I put in use a 70-egg capacity, single-wall, hot-water incubator, new a year ago; had been run only once, and had a record of two chicks. The only place available for its operation was in an upper room, fairly warm in daytime, but cool at night; this location, combined with a single-wall machine and a regulator that seemed to work by contraries, produced a somewhat variable temperature in egg chamber. Not caring to trust eggs from good stock in such a contraption, and really doubting if any chicks could be secured under such conditions, I placed 67 eggs in machine from a pen of two-year-old White Rock hens, (15) mated with a R. I. Red cockerel. These eggs were three weeks old, had only been turned once during that time, and had been kept on the lower shelf of a closet where the temperature at night must have gone as low as 40 degrees.

The temperature of incubator in first twenty-four hours varied from 97 to 106 degrees, after it was held fairly steady at 103-104 degrees, with variations of 98 to 105 degrees. Eggs were tested on seventh day, and three removed. At this time I discovered that tank of machine was leaking, at a far corner which could not be reached. No hens were available, so I put some cornmeal in the tank, in hope that a few particles might find the leak; bade farewell to my last hope of chicks, and kept up steam. To do so it was necessary to pour a cup full of water in the tank every two or three days. Eggs were turned twice a day, and cooled once; from five to 15 minutes, according to temperature of the room. The longer periods were given during the last week, but at any time during the three weeks when it was noted that the temperature was climbing toward 105 degrees the tray was pulled out for a breath of air. The inside of incubator was damp all along one side, and at times the door swelled so it was hard to open. The eggs began to hatch on time, and 56 chicks were secured from 64 fertile eggs; a better per cent. than was secured from hens which hatched at same time, and so far the chicks from machine seem stronger, are more lively, and grow faster. I am not advising others to try hatching under these conditions, but my experience shows what can be done—sometimes. L. H. PHINNEY.

Massachusetts.

Killing and Dressing Ducks.

IF ducks are killed for home consumption they can be slaughtered in any way and scalded. Ducks and geese should be left longer in the hot water than chickens, or wrapped in an old blanket or sack to start the down. If they are to be killed for market the heads should be left on and not disfigured in any way. The Boston market demands dry-picked ducks, and all intending to ship ducks to that city should acquire the art of picking them dry. They should be killed with a pointed knife, sharp on both edges. This may be thrust into the roof of the mouth so as to pierce the brain, and then turned so as to cut the arteries and cause profuse bleeding. Another way is to insert the point of the blade just back of the head with a sawing motion that cuts the two main arteries, and then thrust into the right eyesocket back of the eyeball till the brain is touched. A rap on the head with a short club before sticking will stun the bird and prevent much fluttering. The secret of successful dry picking is to get the feathers off while the bird is dying, for as soon as the duck is dead the muscles contract and hold the feathers tight. After killing, the duck may be hung by feet at a convenient height, or laid on the lap with the head between the right knee and the feather box. Whichever way is adopted the most important thing is to strip off the feathers at the utmost speed, with a pail of water near by, into which the right hand should occasionally be dipped in order to make the feathers stick to it. The fingers can get a better grip on the feathers than when dry. The left hand should hold the carcass, and when necessary pull the skin taut to prevent tearing as the right hand pulls off the feathers by the handful. Much of the down can be rubbed off by the wet hand. The rest must be pulled out separately or shaved off with a knife of good steel honed to a razor edge. The long flight feathers of the wings are usually left on, as are those for an inch or more from the head. The latter is not removed. Any tears of skin should be sewed up.

As soon as the feathers are all removed the carcass should be put at once into cold water, and after it is washed thoroughly to remove all blood from the body and dirt from the feet, it should be put into colder water, ice water if possible. If the ducks are to be shipped to Boston or other large markets they should be carefully prepared by folding the head under one of the wings and then tying a string or tape around the body to hold the head and wings in position. In warm weather the carcasses should be kept on ice till shipped, and should be packed in ice, either in boxes that are to be returned, or if too far away to make the return of boxes profitable, in barrels that need not be returned. W. H. HUSE.

New Hampshire.

Fowls With Colds.

Some weeks ago I purchased some Black Minorca chickens. They soon developed what seemed to be colds. They have a rattling sound in breathing and keep their mouths open most of the time. I do not think it is roup, as I have not noticed any discharge from nostrils or eyes. I have lost two, and the rest all seem to have the same symptoms. Do you think it is bronchitis? A. L. M.

New York.

These fowls are probably suffering from colds due to exposure to cold and dampness in their roosting quarters. They may be treated by adding permanganate of potash crystals to their drinking water, a teaspoonful to the quart, and by injecting with a medicine dropper or small oil can a drop or two of kerosene into each nostril and the cleft of the mouth. The birds should be kept in dry comfortable quarters until recovery. M. B. D.

EGG-EATING HENS.—Somebody asks for a remedy for hens eating their eggs. The most efficacious thing I ever heard of is to feed them chopped, fat salt pork. In fact, as far as my experience and observation both go, it is as sure and speedy a cure as it is easy to give. Somehow it seems to fill an aching void in the hen, and she no longer hankers after her own "hen-fruit." M. W. B.

ANOTHER REMEDY.—I see, on page 615, that H. H. W. is having the trouble that all poultry keepers meet with, hens eating eggs. I have heard this complaint many times and have had experience many times notwithstanding I have used trapnests and fed balanced rations. Here is a remedy that everyone uses in this section and have never heard of a case where it failed to cure hens eating eggs; Vinegar in drinking water will do the trick.

Central Square, N. Y. E. D. B.

ELECTRIC INCUBATION.—There is little to add to my note of last year on electric incubators, but as there are constantly new readers it may as well be repeated that while the electric current is rather expensive, it is the ideal method of heating. Once adjusted, there is nothing further to be done but turn the eggs and wait the 20 days, (since the constant heat gains a day,) while there is no fire risk and no odor. On the other hand the cost, which depends directly on the coldness of the room in which the machine is, may run as high as 10 cents per day. But peace of mind, safety and certainty are sometimes cheap at any price. Each has his own ideas about added moisture, but where there is no flame in the room, the air may be far drier than normal, and a wet bulb thermometer will show that more moisture is needed than when a flame is used. F. D. C.

A PRECOCIOUS COCKEREL.—Here is a pretty good cockerel story. I tried an experiment this Spring in crossing a White Leghorn cockerel with a B. P. Rock hen. The result was snow white chicks, but quite a bit larger than the W. Leghorns. I have one young cockerel that was hatched April 12 and developed so fast that on May 22 he was strutting around crowing, just 40 days old. Can any one beat that? I. J. D.

Iowa.

TRIMMING INCUBATOR LAMPS.—On page 613, H. B. Parker tells how to trim incubator and brooder lamps. His brush may work all right but the ordinary match which lights his lamps will beat the brush a mile. If he will, before turning up the wick rub his match back and forth over the burner, the charred part and no more will be removed, and the lamp will be trimmed exactly even with top of burner, anyone trying this way will never bother with a brush.

Butler, Pa. J. C. H.

HAWKS AND POULTRY.—I note an inquiry on how to prevent ravages of hawks. I have had my coops near buildings, but these small hawks would come down within six feet of house, and make off with chickens, and were so quick that I found it impossible to shoot them. The most satisfactory method I have found was to strew rows of brush, preferably spruce and fir, small trees, 10 or 15 feet apart, in the chickens' run. This gives the chickens shelter and breaks the bird's swoop. W.

Maine.

ANOTHER LAYING WONDER.—Although a short-term egg record is of little value in selecting breeders, I desire to report what I think is a most remarkable performance. My son has a White Orpington pullet which has laid 48 eggs in 44 consecutive days. (March 30 to May 12 inclusive). She then rested three days and has laid 11 more in the last 11 days. On two mornings an egg was found on the roost platform which had been laid some time before daylight, and yet that same day she went on the nest and laid another. Two other days she laid two soft-shelled eggs, but both were full size. We are absolutely sure no other hens obtained access to the house. I never before heard of a hen laying 44 days without skipping a day—to say nothing of the four extra eggs. It is only fair to say she did not begin to lay until the middle of March and had no doubt been storing up energy all Winter. F. N. B.

New York.

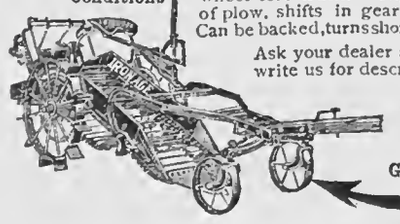
REPORTER: "I hear a wild man was seen roaming about in a swamp here." Native: "Yes; he was a city man, trying to locate a choice building lot he'd just bought."—Chicago Daily News.

TOMMY started his third helping of pudding with delight. "Once upon a time, Tommy," admonished his mother, "there was a little boy who ate too much pudding, and he burst!" Tommy considered. "There isn't such a thing as too much pudding," he decided. There must be," contended his mother, "otherwise why did the little boy burst?" Tommy passed his plate for the fourth time saying—"I suppose because there was not enough hoy."—Yonkers Statesman.

DIGGERS

for potatoes—4 styles to choose from to suit your special conditions. We guarantee them to do the work we claim for them. All growers know that it pays to use diggers even on five acres—they save much valuable time and save all of the crop in good condition.

IRON AGE DIGGERS



No. 155 For Heaviest Conditions

Wheels, 32 or 28 inch. Elevator, 22 or 20 inches wide. Thorough separation without injury to the crop. Best two wheel fore truck. Right adjustment of plow, shifts in gear from the seat. Can be backed, turns short into next row.

Ask your dealer about them and write us for descriptive booklet.

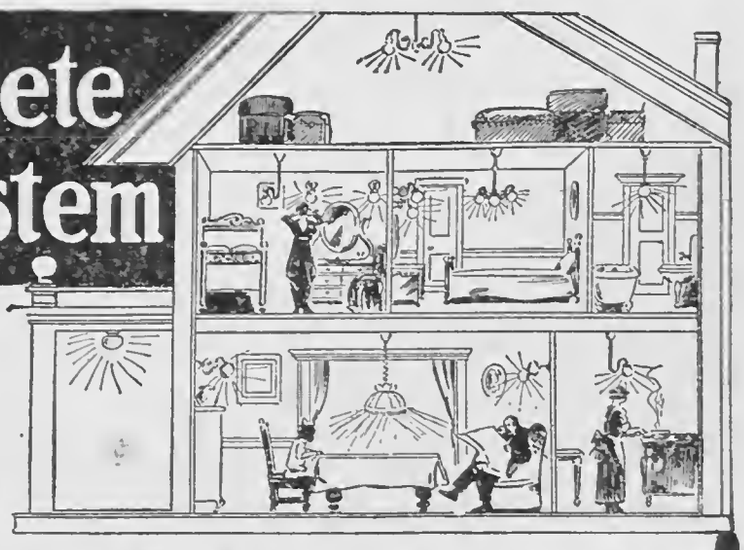
$1.00 Brings This Complete Home Lighting System



Startling Offer!

Send Coupon for Details.

At last you can get this perfect, time-tested Ann Arbor Lighting System on a new "no risk" plan which means absolute satisfaction before you pay. This extremely liberal offer is made to enable you to install this clean, brilliant light in your own home on a free trial.

The Famous Ann Arbor Lighting System

has made good in thousands of homes where it has been put to the test. It is inexpensive to install as well as to operate. The Ann Arbor System gives perfect light at the lowest cost.

Brilliant Light in Every Room!

The light produced by the Ann Arbor System is wonderfully soft and restful and yet remarkably brilliant, flooding every corner of the room. Cheer and comfort are essential to perfect home life. Nothing makes the home attractive, cheerful and comfortable day or night like good, clean light.

Costs Practically Nothing to Operate

Besides giving clean, safe and satisfactory light, the Ann Arbor System furnishes the cheapest lighting service in the world. The cost per candle power of light is way below electricity, gas or kerosene. The saving goes a long way toward paying the small cost of installing

The Complete System Sent for Only $1

That's all you need pay down. We ask this just as an assurance of good faith. We ship the outfit direct to you and you can set it up and try it out in your own home. We don't get our money unless you're absolutely convinced that the Ann Arbor System is just as perfect and economical as we say it is.

Send Coupon Today for Free Book and Catalog

Get the facts. We have a beautifully illustrated booklet, "Night Daylight" telling all you want to know. Act now. Don't put up any longer with dirty, smelly, dangerous kerosene lamps. This is the Safety First age—the modern age. Get an Ann Arbor System—beautify your home and insure the safety of your family and property. The cost is low, the upkeep practically nothing, and our special offer makes it easy for you. Send today for full information regarding this special offer. Mail coupon now.

Hope Farm Notes

HIS FEATHERS RUFFLED.

MR. John H. Robinson, editor of Farm Poultry, devotes a page of his paper to prove that "*It is up to the Hope Farm Man.*" This is all about my opinion regarding "standard" White Wyandotte poultry. Mr. Robinson devotes some 1,000 words to showing that the Hope Farm man is anything but an authority on poultry. Everyone knew that before. Then our friend gets down to these propositions:

For a year's laying on my place I will match a pen of 10 White Wyandottes of an exhibition stock, with such length of leg and feather as are shown in the Standard ideal, against any 10 "bred to lay" non-Standard Wyandottes that the Hope Farm may select for a year's laying at Hope Farm.

For a year's laying on my place I will match a pen of four extremely low set, loose feathered exhibition White Wyandottes against an equal number of non-Standard Wyandottes, kept as one flock on Hope Farm.

For a year's laying on my place I will match a pen of 10 Standard White Wyandottes—no two from the same breeder—against 20 scrubs of the kind the Hope Farm man sent to the laying competition at Storrs Experiment Station to be selected as these were and kept as one flock for a year on Hope Farm.

Now I never had the pleasure of meeting Mr. Robinson, who is regarded as a high authority on poultry. A good friend who seems to be posted writes me this:

"Brother John is mighty shrewd, and he can certainly twist the other fellow's statements and meaning in an astonishing way." Now right at the beginning I will say that I am neither a word-twister nor a poultry expert. I have a few opinions which I am prepared to back. We printed on page 725 the picture of what is supposed to be an ideal Wyandotte hen. I called it a plump dumpling of a bird, and I do not believe hens shaped like that one can make a good laying record. Now if Brother Robinson will come forward with birds of that shape, I will meet him with utility birds. The plan of conducting such a contest with one flock on my farm and the other on his farm is nonsense. Such an arrangement would queer it from the start. Most people would regard such a "contest" as a bluffing match between hired men, no matter how carefully it was conducted. It would be a match not between types of hens as much as between types of hen-feeders. As a hen-feeder and a word-twister, the Hope Farm man would be beaten long before he went into the ring. The place for such a trial is at one of the egg-laying contests. I have the utmost confidence in the managers of these contests. Brother Robinson can arrange to have his birds cared for and fed as he specifies. I am willing to leave it to the contest managers. So all Brother Robinson now has to do is to say which public contest he prefers and come right up to the rack with his birds. Under no circumstances whatever will I go into any contest with the pens separated and not under official supervision. I agree to collect the birds, pay the entrance fee and then let them alone without a murmur or a kick, no matter what they do. My plan will be to call for volunteers who have good utility Wyandottes which they are willing to match against the "standard" type. Then we will select the birds with the best breeding and shape for egg production. I hope Brother Robinson will do much the same and select birds which score as close to "perfection" as possible. Then we shall have the long-delayed square-toed contest between plumage and performance or standard vs. utility. *Come Brother Robinson, walk up to the rack with your birds.*

LONG AND SHORT BACKS.—The Wyandotte breeders understand well enough that I have nothing against their breed. I have kept Wyandottes in a small way, and like them. I am merely trying to help settle this old question about "standard" and utility. Both sides have been going around for some years with chips on their shoulders, but when it comes to knocking them off it seems to me like "after you Alphonse." So the Hope Farm man comes forward and knocks off both chips—first by entering his "scrubs" at the poultry contest. This operated just as I felt it would. First both sides laughed till they cried. Then the scrubs began to lay a few rings around the weekly records of the pure bloods. Laughter, they say, is close to tears. It is also close to a scrap. Thump the Hope Farm man all you please, gentlemen. You can't hurt his feelings by calling him ignorant, stupid—a drone or a fraud. He might possibly be all four. If, however, he can line up the "standard" and utility men for a square and straight contest between short back and long back he will be well satisfied. When this question of Tom Barron's Wyandottes came up I wrote all the Americans who have entered Wyandottes in the egg-laying contests, asking how high their birds would score. Here is a sample of the replies:

I took a trip over to Thorndale to look over my Wyandottes there, and I do not think my birds would score over 85. I have had 14 years' breeding experience with Wyandottes, and would say that the Standard makers have almost killed the breed by insisting on too short a body for utility purposes. I am a machinist by trade, and came out in the country to die of consumption 15 years ago. I was broken in health and pocketbook, and started to raise Wyandotte chickens. It was not long before they began to shorten the backs of the Wyandottes and I fell short on Winter eggs. I tried to stay with them for a couple of years, but I found if I wanted eggs in Winter in paying quantity I had to breed longer backs. I have done so and my birds are giving me a nice living from utility stock entirely. GEORGE W. MIDDLETON.
Pennsylvania.

This backs up what Tom Barron said about the working people of England demanding a bird that will lay eggs. There is a whole lot at stake in such a contest as Mr. Robinson proposes, and I think the utility men will welcome it. I want to hear from all who are interested in regard to selecting utility birds with known "egg pedigrees." Of course I assume that Mr. Robinson will agree to enter one of the egg-laying contests with this important matter at stake.

How deep do you plow to cover up such tall rye in order to get a good seed bed, and at the same time not have it tangling in the cultivator and other machinery. J. W. B.

On the average our plows run six to seven inches deep. The heavy chain in front turns the rye under and packs it down. Both Cutaway and Acme run with a shallow cut and we rarely cultivate over three inches deep. I think this rather shallow plowing for corn where the soil is well packed better on the whole than deeper working. Surely shallow cultivation in an ordinary season is better than deep working. Our plan is to plow under the rye and clover and operate so as to decay and use up this mass of green stuff as rapidly as possible. Where a green crop is plowed under only once in four or five years the plans would be different, but where we put under big crops every year our scheme is to make them available at once. This is done by packing them where the roots of the corn would naturally feed and putting on lime.

You say that you apply fertilizer to growing corn by hand. Let me know how you apply it so as to prevent it from burning the corn. J. W. B.

I do not suppose our method would stand any scientific test. We simply take a handful of fertilizer and with a twist or flirt of the wrist scatter it alongside of the hill of corn. The plan is not to drop it in a bunch but to cover a space six to eight inches long beside the growing corn. The cultivator and hoe will work it into the ground properly. One year the men dropped the fertilizer right on the growing corn in the hill. I thought it was ruined, but the weather continued dry and no damage was done. This fertilizer was mainly bone and potash, which was not so "hot" as acid phosphate would have been. In a wet season acid phosphate put right on the hill might have injured the corn. A good corn fertilizer can be made by mixing one part of tankage or dried blood, three parts fine bone or acid phosphate and one part muriate of potash.
H. W. C.

"DON'T you ever change your mind?" "Of course," replied Miss Cayenne. "It is very desirable to change your mind occasionally in order to call attention to the fact that you had any in the first place,"—Washington Star.

"Doctoring" a Piece of Hard Soil.

WE have a piece of land lying low, so low in fact that the water stands on it at times, but on account of neighbors we cannot get a fall to drain it. I have plowed this piece today, and it is baked hard and turns up in chunks. The soil is a clay; it doesn't seem to have any humus in it at all. We plowed the grass up last Fall and left it open all Winter. I am thinking of putting one ton of limestone to the acre, harrowing it in well and sowing Crimson clover to plow under next Spring. Do you think this would help it any, and how much clover should I put to the acre? Would I better sow it now or wait till later?
New Haven, Conn. R. B. O.

Unless this land can be drained in some way it is not likely to prove satisfactory. It is possible that by digging deep wells in it you could strike down below the subsoil a stratum of sand or gravel, which will permit the surface water to soak down and away. There are some localities where this plan can be worked out successfully. Our advice would be to use burnt or slaked lime instead of the ground limestone. On soil of this character you need a strong and quick chemical action, and the slaked lime will give this far better than the ground limestone can. You will make a mistake in depending upon Crimson clover alone as a cover crop. This clover is not well adapted for your locality, or to this kind of soil. In fact Crimson clover is not a sure crop north of Philadelphia, although in some seasons it will go through and make a success. Our plan would be to use at least one ton of slaked lime at once, then sow two bushels of buckwheat and two pounds of Cowhorn turnips to the acre. This ought to make heavy growth. About the middle of August we would plow this crop under the ground, fit the soil and then sow on each acre one bushel of rye and 20 pounds of the seed of Hairy vetch. This would make a good growth for the Fall, and come in the Spring, and when plowed under will supply large quantities of organic matter—very much more than you could hope to get from the Crimson clover.

The Marauder Crow.

In an article last Winter on that black rascal, the crow, he was defended for his good qualities. I do not happen to know any, but know many bad qualities. Unless the crow is exterminated, or greatly reduced in numbers, he will exterminate our song birds. Eggs and young birds are the principle part of his diet. The crows took the young robins from two nests last Summer within 40 feet of the house. W. M. PATTYSON.
New York.

"ALBERT," said the teacher to a small pupil, "do you know what wind is?" "Yes, ma'am," was the reply, "wind is air that's in a hurry."—Credit Lost.

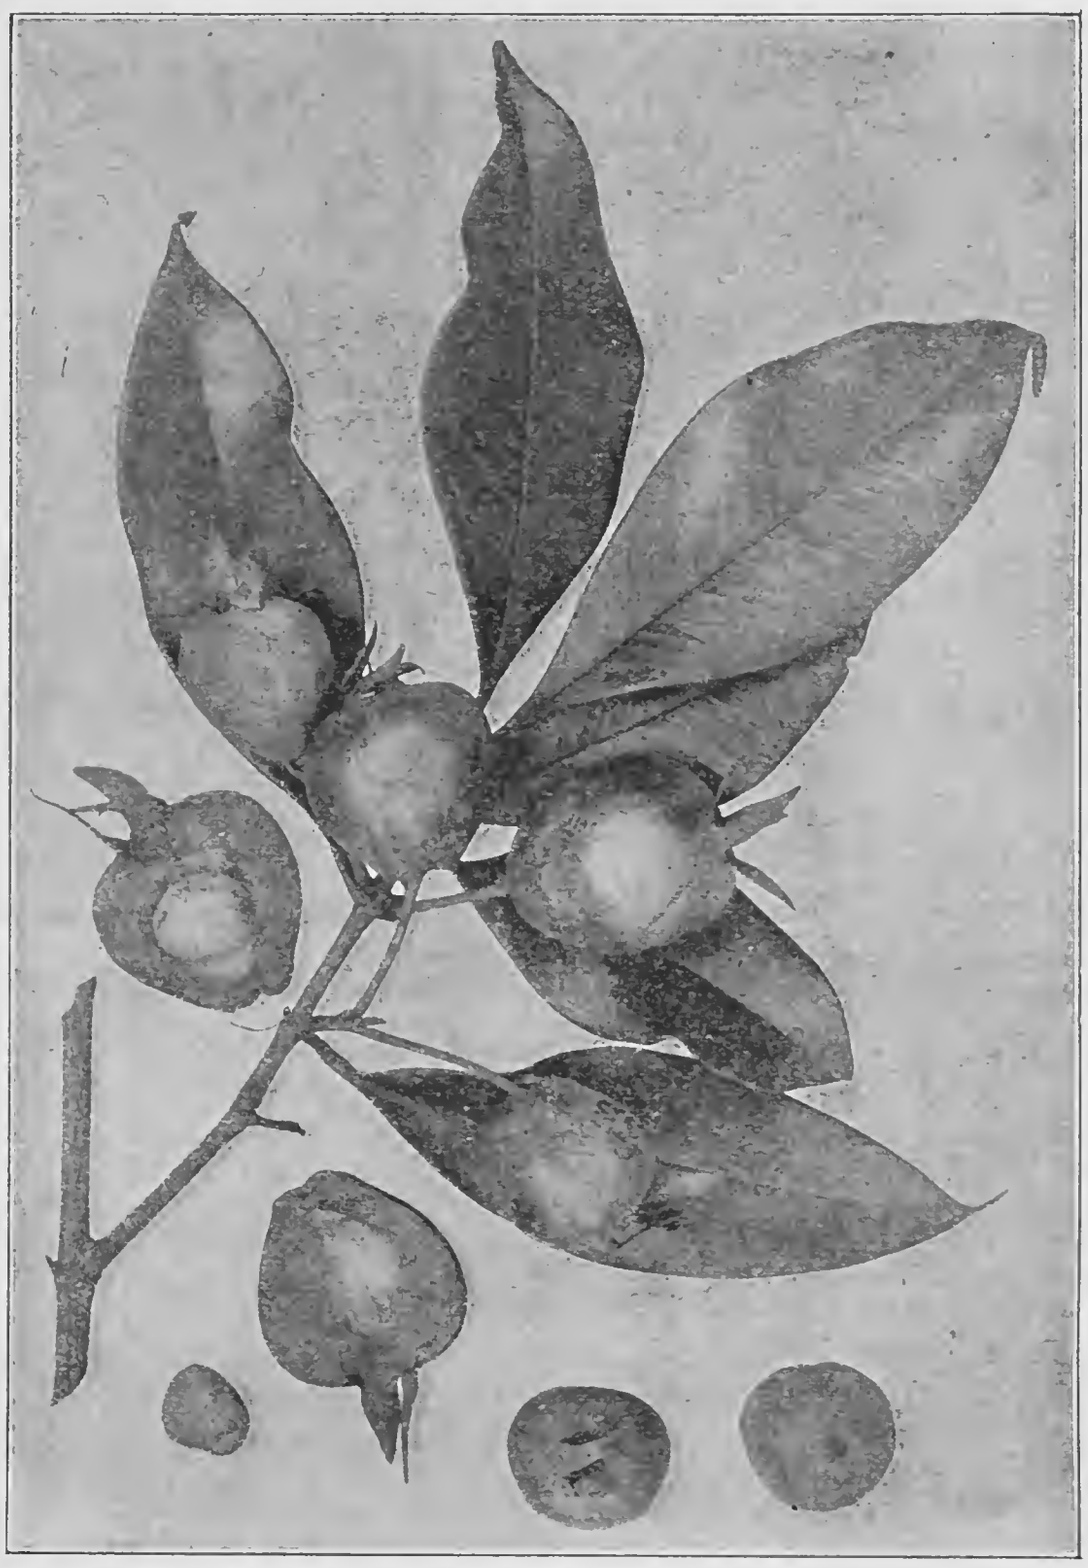
Ruralisms

A VALUED BRAZILIAN FRUIT.

AMONG interesting fruits described in Bulletin 93, issued by the Office of Foreign Seed and Plant Introduction, is the pitomba. Mr. Dorsett, Mr. Shamel and Mr. Popenoe have collected a quantity of valuable things during their recent Brazilian expedition, giving especial attention to myrtaceous fruits, of which there are many in Brazil. The pitomba, botanically Eugenia luschnathiana, is thus described:

The tree is from 20 to 30 feet in height, compact, densely foliated and very handsome in appearance. The individual leaves are elliptical lanceolate, acuminate, about 3½ inches in length, thick and leathery, glossy, deep green above, light green beneath. Veins scarcely discernible on upper surface. The fruits, which are produced on the small branches, are broadly obovate in form, about one inch in length and seven-eighths inches in breadth, on an average. The stem is one inch or more in length, slender. Apex flattened and broad, crowned by the persistent calyx, with four or five green lanceolate sepals one-half inch or more in length. Color of fruit deep orange yellow, when fully ripe almost bright orange. Skin thin, tender and easily broken, enclosing a soft melting pulp, bright orange in color, very juicy, and of an acid, very aromatic flavor. The aroma of the fruits themselves is very penetrating. The seeds, normally one in number but sometimes two, three, or rarely four, are attached to one side of the seed cavity, and do not adhere to the flesh. When single, the seed is nearly round, slightly less than one-half inch in diameter, the seed coat whitish. When more than one, the seeds are hemispherical or angular. The season here is December. The trees which we have seen do not produce as heavy a crop as the grumichama or some other myrtaceous fruit, but nevertheless bear fairly abundantly. The fruit is especially esteemed for making jellies, and is also used for jams and sherbets, while the negroes relish them when eaten out of hand. The flavor, however, is somewhat acid, when they are eaten in this way; and the fruit will probably be of the greatest value for culinary use rather than dessert. It should be tried in the warmest parts of Florida and California. It seems to be vigorous and easily grown, great numbers of volunteer seedlings springing up around the base of the tree after the fruit has dropped.

The picture, Fig. 334, shows foliage and fruits of the pitomba, from the garden of Col. Elvidio Esteres Assis, at Cabulla, Bahia, Brazil. The brilliant yellow color, and agreeable, penetrating odor of this fruit make it very interesting. Its flavor, though somewhat acid, is pleasant, and is used principally in the manufacture of jams and jellies, for which purpose it is highly esteemed by the Brazilians. Another Eugenia, E. uniflora (Michelii?) the pitanga, is already grown to a limited extent in Florida and California. In Brazil it is a favorite hedge plant. This is called the Cayenne or Surinam cherry, while the Jambolan plum and the rose apple or jambosade of the East Indies, the grumichama of Brazil and the Brush cherry of Australia are other Eugenias valued for their fruit.



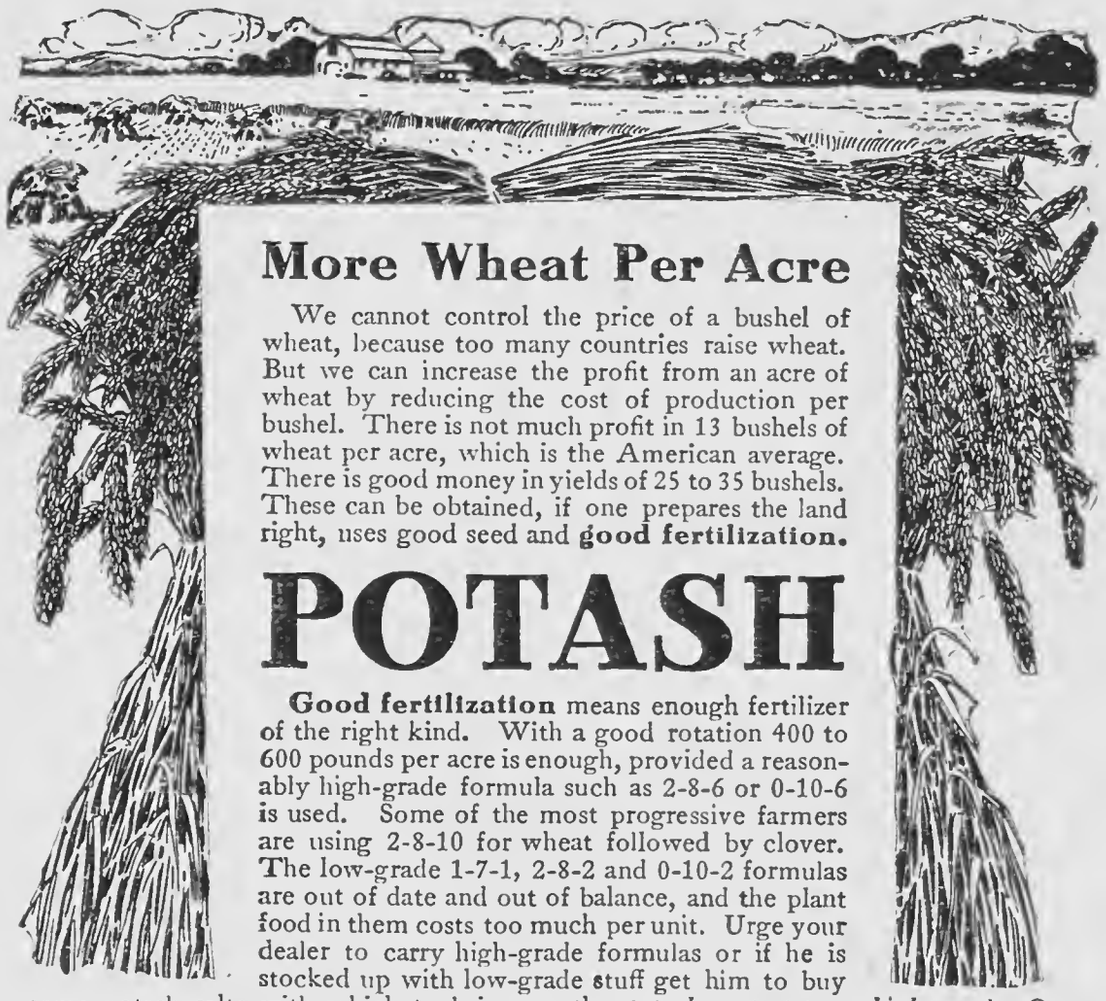
FOLIAGE AND FRUITS OF THE PITOMBA. FIG. 334.

Burnet, an Old-fashioned Plant.

CAN you tell me where I can find the plant called "burnet," which is an old-fashioned plant used in making drinks in hot weather? J. J. H.
Jericho, L. I.

"Burnet" is Poterium Sanguisorba, a perennial herb producing branching flower-stems three feet high, with reddish purple flowers. Both the common burnet and a smaller variety called Lesser burnet are natives of Great Britain, where they are grown in old-fashioned gardens for the leaves, which are used in salads and in cooling drinks. We do not know where the plant may be procured in this country, as it does not appear in any catalogue accessible to us. The Canadian burnet, P. Canadense, or Sanguisorba Canadensis, is a native plant, found in wet woods in the North; it has white flowers. The Poteriums belong to the Rosaceæ or Rose family.

POISONING CORN.—I have noticed several articles in regard to treating seed corn and crows in your paper. I used to have lots of trouble in this way, but have hit on a plan that works very successfully for me. After planting the corn and rolling the ground I take a pint or a quart of corn, according to the size of the field, that has been previously soaked in 10 cents worth of strychnine and allowed to dry. Then I plant with a planter very shallow 10 to 12 hills in a place in the prominent parts of the field, being careful that the crows can see the marks of the planter. I usually do this in the evening, and in the morning there will be a few dead and dying crows, which keeps the rest from ever visiting the field again. D. B. WEAVER.



More Wheat Per Acre

We cannot control the price of a bushel of wheat, because too many countries raise wheat. But we can increase the profit from an acre of wheat by reducing the cost of production per bushel. There is not much profit in 13 bushels of wheat per acre, which is the American average. There is good money in yields of 25 to 35 bushels. These can be obtained, if one prepares the land right, uses good seed and **good fertilization.**

POTASH

Good fertilization means enough fertilizer of the right kind. With a good rotation 400 to 600 pounds per acre is enough, provided a reasonably high-grade formula such as 2-8-6 or 0-10-6 is used. Some of the most progressive farmers are using 2-8-10 for wheat followed by clover. The low-grade 1-7-1, 2-8-2 and 0-10-2 formulas are out of date and out of balance, and the plant food in them costs too much per unit. Urge your dealer to carry high-grade formulas or if he is stocked up with low-grade stuff get him to buy some potash salts with which to bring up the *potash content* to a *high grade.* One bag of muriate of potash added to a ton of fertilizer will do it.

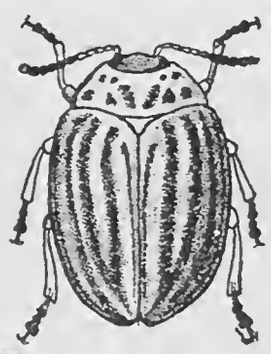
If you prefer real bone or basic slag in place of acid phosphate try 300 to 400 pounds per acre of a mixture of 1600 pounds of either with 400 pounds of muriate of potash. You will find that **Potash Pays.**

These high-potash mixtures produce better wheat, clover, heavy grain and stiff straw.

We sell Potash salts in any quantity from 200 pounds up. If your dealer will not get potash for you, write us for prices and for our FREE booklet on Fall fertilizers.

GERMAN KALI WORKS, Inc., 42 Broadway, New York

Chicago, McCormick Block — New Orleans, Whitney Central Bank Bldg. — Atlanta, Empire Bldg.
Savannah, Bank and Trust Bldg. — San Francisco, 25 California Street



Be Prepared for Him

Or, Mr. Bug will counteract the effect of all your time and money spent on high grade fertilizer, high priced seed, careful preparation of soil, planting and cultivating. Meet him more than half-way with an up-to-date Sprayer and protect against blight in the same operation—it's as likely to get your potatoes as lightning is to strike your barn and it is more sure in its destruction. Don't you believe in insurance?

IRON AGE SPRAYERS

include many sizes and styles of equipment from which to choose the one that will best insure your crop against loss. Good for tomatoes, cabbage, pickles, cantaloupe and other row crops. We have a "Spray" book that tells all about them. Also, a calendar telling "When, How and What to Spray With." Don't wait until Mr. Bug arrives or you may have to adopt poor, slow and costly methods.

Hardwood Ashes Best Fertilizer in Use. GEORGE STEVENS, Peterborough, Ont.

$10,000.00 Backs This Drill

If this Hertzler & Zook Grain Drill does not satisfy you in every way, ship it back, and if we fail to return your money in full, paying freight both ways, we forfeit $10,000 which our bankers hold to protect you—you can't lose.

We make this big guarantee because we know this is the best drill on the market today—sows all kinds of grain, seed or fertilizer accurately and without waste. High, broad-tire wheels lighten draft. Extra large grain box. We also make a low down and plain seed drill. Sold direct from factory; saves you $10 to $20 dealers' profits.

Write for catalog and special offer.

The Rural New-Yorker

THE BUSINESS FARMER'S PAPER

A National Weekly Journal for Country and Suburban Homes

Established 1850

Published weekly by the Rural Publishing Company, 333 West 30th Street, New York
HERBERT W. COLLINGWOOD, President and Editor.
JOHN J. DILLON, Treasurer and General Manager.
WM. F. DILLON, Secretary. MRS. E. T. ROYLE, Associate Editor.

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.01, equal to 8s. 6d., or 8½ marks, or 10½ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates, 60 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. We use every possible precaution and admit the advertising of reliable houses only. But to make doubly sure, we will make good any loss to paid subscribers sustained by trusting any deliberate swindler, irresponsible advertisers or misleading advertisements in our columns, and any such swindler will be publicly exposed. We are also often called upon to adjust differences or mistakes between our subscribers and honest, responsible houses, whether advertisers or not. We willingly use our good offices to this end, but such cases should not be confused with dishonest transactions. We protect subscribers against rogues, but we will not be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and to identify it, you should mention THE RURAL NEW-YORKER when writing the advertiser.

TEN WEEKS FOR 10 CENTS.

IN order to maintain the improvement and enlargements that we are now planning for THE R. N.-Y., we should have a circulation of 200,000 copies weekly. We must depend on our old friends for this increase. To make it easy for these friends to introduce the paper to other farmers who do not now take it we will send it 10 weeks for 10 cents for strictly introductory purposes. We will appreciate the interest of friends who help make up the needed increase of subscriptions.

*

SOME of the Maine potato growers are troubled over rumors of what the Agricultural Department will do to prevent shipment of diseased potatoes. The powdery scab has been found in some sections of Maine. The Department has prepared certain regulations for shipping potatoes:

They will provide for the shipment after inspection of all sound healthy potatoes. No potatoes exposed in any way to powdery scab will be shipped out as seed stock, but clean potatoes from which all scabby specimens have been removed may be forwarded as table stock. The inspection of table stock will probably be limited to the area known to be infected with powdery scab, which includes Aroostook and a few towns south of that county.

It is not likely that any large proportion of Maine potatoes will be confined to the State except those actually carrying the disease. Seed stock will be carefully examined, and the new regulation will probably compel some shipments for table purposes which would otherwise go as seed.

*

HERE is a thing for the water-glass egg people to think about. There is no question about the economy in using this material to preserve *fresh* eggs. We have several water-glass hens in the cellar safely carrying infertile eggs to Thanksgiving or even Christmas. Now we have always advised this plan as a means of holding the family egg supply. We would stop right there. We find that some of our people are putting eggs into water-glass expecting to take them out again in November and sell as new-laid eggs.

Forget it at once!

Such a plan will ruin any hope you may have for building up a good trade. The water-glass egg is not *fresh*. It is a good family substitute, but there it stops. Any attempt to sell it without plainly stating what it is will hurt you far more than the extra price can help you. Water-glass is for home use. Cold storage is the place for keeping salable eggs.

*

ONE of the most valuable bulletins issued by any of the experiment stations in many years is the recent pamphlet by Dr. G. F. Warren, from Cornell. This does not tell how to grow any crop, but it will make farmers *think* about the agricultural conditions in New York State. Dr. Warren gives us figures and facts showing the size and value of farm crops for many years, and the prices which farmers have received for them. Here we have a clear statement of the 35-cent dollar. These gentlemen who say there is no such thing ought to study this bulletin. And the "two blades of grass" theory! Dr. Warren shows clearly and scientifically that farmers will gladly produce two blades of grass as soon as the one blade now grown returns to the producer as fair a profit as now goes to the handlers. To try to make the farmer produce two blades while he gets 35 per cent. of the value of one blade is as fruitless as telling the ocean to stop flooding the harbor. We shall give a popular study of this bulletin in the hope of helping farmers to *think* out the lessons it teaches. It is very encouraging to have our experiment stations get down to the fundamentals of true farm political economy.

WE understand that S. A. Martin, the Farm Bureau Agent for Onondaga County, New York, has started a campaign for testing what is called "a permanent system of fertilization." This means the use of ground phosphate rock in a rotation containing clover and Alfalfa, and also in combination with ground limestone. The Geneva Experiment Station will coöperate in this experiment. It is a good idea. We have had a good many statements about the use of raw phosphate. Some were too loose to stand still, others were tied too fast to prejudices to be of any value. Onondaga County is a first-rate place to test the matter out.

*

MANY a farmer will lose money this season through not looking ahead three months ago. The bugs will be at the potatoes before you know it, and no poison on hand to kill them promptly. Just when plowing is most needed the plow point breaks and you find that you did not order new ones. The cultivator teeth are worn out, and will not fit on securely, but you did not lay in a new supply. You intended to order a new blade for the mower, but overlooked it, and the best part of a good hay day will be lost. We are all more or less guilty of these failures to look ahead, and each one spells loss. Our Northern growing seasons are short at best, and apparently growing shorter. Hindsight is all right to think about, but foresight goes walking out with profit.

*

THE Supreme Court has decided that the Federal or National Government has dominant power over railroads which do an interstate business. Various States have claimed the power to regulate that part of the business of these interstate roads, which was carried on inside of their territory. What the Court has now decided is that an order of the Interstate Commerce Commission is superior to State legislation. The case before the Court referred to alleged rate discrimination against Shreveport, La. This town is 40 miles from the Texas boundary line, and is a business rival of Dallas and Houston, Tex. The merchants of Shreveport complained that they had been shut out of all Texas business because the railroad commissioners of that State had compelled the railroads running through Texas to reduce rates lower than what the Interstate Commerce Commissioner allowed the railroads running into Shreveport. By means of this difference in freight rates of course Dallas and Houston were given an advantage over Shreveport. For example, 60 cents would carry a quantity of merchandise 160 miles east of Dallas, while the same amount carried similar merchandise only 55 miles west of Shreveport. Thus the trade of Eastern Texas was being monopolized through a State law operating on interstate railroads. The question was, whether a single State should have such arbitrary power to prevent injury or ruin to a city or section through rate discrimination. The Supreme Court decides that the Commission is to have this final power. The decision is generally hailed as a "victory" for the railroads. They will now be, it is said, "under one instead of many masters." The final outcome may not be such a victory after all. The "one master" may finally be the people representing government ownership.

*

NOW comes the report of a new breed of poultry imported into England. This is the Dervish fowl—the product, it is said, of 1,000 years of breeding.

The forebears of these fowls were left at Khartum by the Dervishes at the time of the rout, and they are of pure breed. The more salient of the two breeds is rose comb, the cock having bright golden yellow points and black legs. The pullets look just like water birds, black with a sort of gold powdering, black beaks, legs and eyes, and a little black tuft on their heads. They are quite small and rather long in the leg.

There is usually a rush for "something new" in all lines, but the chances are that you now have, right on your farm, the foundation for something far more profitable than this Dervish. One reason the Hope Farm man started his scrubs at the egg contest was to demonstrate, if he can, the value of "grading up" with purebred fowls. We are all talking about the great value of purebred dairy sires, as if the improvement in our herds must come through their blood. Why not the same with hens? We believe these egg-laying contests are finally to give us laying strains of hens with the habit so well fixed that we can use their blood for improvement as confidently as we now use the blood of some celebrated family of dairy cattle. Starting with what you now have, and breeding judiciously in this way, you can secure the best hen for your farm.

WE intend to follow this "bumper crop" of wheat right through. The Government reports indicate a considerable increase in the yield. Now let us all watch the prices which are actually paid to farmers for their wheat. We do not mean the trade prices printed in the daily papers, but the actual figures at which a farmer can sell his crop in the local market. Many farmers have kept accurate figures showing prices paid for the wheat in former years and also prices paid for bran and other mill feeds. With a "bumper crop" the prices for feed ought to be lower, while if the farmer is to get any profit out of the increased yield, he should receive as much per bushel this year as last year or the year before. Does it not stand to reason that if the wheat crop is increased by 20 per cent. the price of bran and mill feed should drop 20 per cent. in price? Does it not also stand to reason that if the handlers all receive as much for carrying one bushel of this mighty crop, while the price of bread is not reduced, that the price to the farmer should likewise remain the same? The daily papers are now filling up with statements like the following:

E. G. Broenniman, vice president of the New York Produce Exchange and a prominent flour man, got back to New York from the Southwest yesterday fully convinced from first h nd observation that a Winter wheat crop of undreamed of proportions has been successfully raised.

But there will be no dreams about the meaning of all this. We shall see the price to the producer hammered down cent by cent, while the bread eater will continue to pay his old price. Now we do not want the trade prices and figures printed in the daily papers, but we want the actual figures from farmers who sell wheat. You ought to receive as much per bushel for your "bumper crop" as for the smaller ones of former years. Bran and mill feed ought to be cheaper. Now will you send us accurate figures when you sell or buy, showing just how this year's prices compare with former ones?

*

THE honest nurseryman has a few tricks up his sleeve, like all the rest. Most of them are old. Here is a new one, reported by the Malone Telegram. A farmer in St. Lawrence County, N. Y., ordered a number of McIntosh Red apple trees from the McIntosh Nursery Company in Ontario. He did this because he had been told that the Canadian-grown trees are superior. In order to import trees from Canada it is necessary to obtain a permit from the National Agricultural Department, and also a certificate from the Canadian authorities that the trees have been fumigated. This farmer obtained permission to import these trees. To his surprise he received a message from a local butcher that certain trees had arrived for him. This farmer notified the revenue collector, who went to the butcher's house, where he found the trees, bearing what purported to be tags of inspection from the Canadian officials. The butcher explained the matter by saying that the trees were shipped to him from Iowa. He was instructed by this Canadian nursery to divide these trees into two lots and deliver them to two buyers. The Canadian nursery had sent him a lot of tags, which he was to affix before delivering the trees, and this he had done, so as to give the impression that these Iowa-grown trees had really been grown in Canada, and inspected by the Canadians. This butcher had letters from the Canadian nurserymen which proved his story. He did not even take the trouble to read the tags which were sent him, but had pasted them on, as though this were an everyday practice. The collector let this butcher go, upon this explanation. He telephoned to the Canadian nurserymen, and they promptly saw that they were "caught with the goods on." Not daring to come over the line and face the evidence of their deceit, these fellows told the butcher to sell the trees for what he could get, and he did so, the result being that the original purchaser got some of these trees at a lower figure than he was expected to pay the Canadian nurserymen. This is a new trick of the trade, although it may have been played before for all we know. Very likely these Iowa trees were just as good as those which were really grown in Canada, but what a farce this so-called inspection has proved to be by such miserable cases as this.

BREVITIES.

SOME people embrace an opportunity so hard that they hug it to death.

A REMARKABLE American cargo recently left Seattle for China. There were 60 logs—40 feet long and five to nine feet in diameter, and weighing 25 tons or more!

LAST year the brick yards along the Hudson Valley turned out over one billion bricks valued at $5,636,661. These bricks were used in New York City. Rather expensive clay soil!

DRY POISONS FOR COTTON WORMS.

[As most of our readers know, arsenate of lead is now produced and sold in a dry or powdered form, and has been offered as a substitute for Paris green. Certain manufacturers of Paris green have stated that the dry arsenate is a failure as an insecticide, very injurious to workmen and dangerous to those who use it in the field. We have no interest in any such controversy except a desire to give our readers the truth, that they may safely use their own judgment. We sent to chemists, entomologists and practical farmers asking for the facts. They all, without exception, agree that the dry arsenate is a safe and effective form of poison. The following statement from W. E. Hinds, State Entomologist of Alabama, is typical.]

THE MANUFACTURER'S SIDE.—I have corresponded with several manufacturers of arsenate of lead and have talked wth a number personally, and all agree in stating that they consider arsenate of lead much safer to manufacture than is Paris green. It is a general practice among insecticide manufacturers to make Paris green only during the Winter season, while they can make arsenate of lead, either powder or paste, at any time of year. Several manufacturers have stated to me that in all their experience they have known of no single case of serious effects to workmen engaged in the manufacture of arsenate of lead, either paste or powder.

EXPERIENCE OF USERS.—From the standpoint of the user of the material, I would say that in the campaign against the cotton worm in the Fall of 1911, more than a million pounds of arsenical poisons were sold for use in Alabama and Mississippi alone. At least two-thirds of this material was powdered arsenate of lead. Before the end of that season very numerous records of the following nature had accumulated: Planters would start their poisoning work with Paris green, which is generally applied as a dust by what is called in the South the pole and bag method. In this method of distribution the common practice is to cut a piece of 1x4-inch board so that it will be 12 or 15 inches longer than the distance at which the rows of cotton are planted. Cut four square blocks of the same material. The blocks are nailed at right angles on the under side of the board, one at each end, and the others about 15 inches in from each end. A large hole is bored in each end half way between the vertical boards, and through these openings the poison is introduced after the apparatus is completed. The bag is formed of common sheeting or doubled cheese-cloth usually, and is tacked smoothly and tightly along one side of the board, stretched around the blocks and fastened to the opposite side of the board, thus making a rectangular bag with solid wooden top and ends. The middle of the board is cut down to a size that can be conveniently held in the hands. This outfit is usually carried by a workman riding a mule. It is jarred by the movement of the animal in trotting or by jarring it on the pommel of the saddle. Occasionally the poles are made long enough to carry four bags and treat four rows instead of two. Workmen on large plantations work in groups of probably several men. Many of them take no precautions whatever against inhaling the dust, but we advise covering the nose and month with a handkerchief to reduce or prevent inhalation of the material. Powdered arsenate of lead is applied undiluted with this outfit. The supply of poison is often carried in a wagon at the ends of the rows, and a workman there refills the empty bags so that the riders may exchange them and continue their work without delay.

DANGER FROM PARIS GREEN.—The writer has personal knowledge of many instances in which the use of Paris green distributed in this manner has produced serious sores upon both workmen and animals engaged in its distribution. Sores are formed especially where perspiration accumulates and chafing occurs, and is undoubtedly due to the effect of the accumulation of water soluble arsenic in the Paris green. In many cases workmen became alarmed and refused to continue to use Paris green, thus forcing the planters to change from Paris green to powdered arsenate of lead as a source of poison.

ARSENATE OF LEAD SAFER.—The writer has personally seen the application of powdered arsenate of lead carried on on a large scale, and has in his possession photographs of a gang of workmen riding at a trot across a cotton field, and the cloud of white dust around them could be seen for a very long distance, and shows clearly in the photographs. Even where engaged continuously in this work for many days in succession, and with the vast quantity of material used in this State in the season of 1911, the writer has been unable, even with special inquiry, to learn of a single case in which a sore was formed on either workman or animal, or of any other injurious effects from the use of powdered arsenate of lead.

INSECTICIDAL VALUES.—So far as the insecticidal value of the two materials is concerned, it has been repeatedly demonstrated that the powdered arsenate of lead protects the cotton plant for about three weeks on the average, while with Paris green the protection may not last, and usually does not last, more than a few days, particularly during showery weather. I have known instances where five applications of Paris green were made for the control of one brood of cotton worms. The arsenate of lead costs somewhat more per acre for the poison than does Paris green, but beside adhering longer and much better to the foliage, it has the additional advantage of not checking the fruiting of the plant while Paris green may do so, even though not showing apparent burning, and if carelessly distributed it is very certain to burn and kill many plants through its water soluble arsenic.

Alabama Entomologist. W. E. HINDS.

A Day's Work; Harvesting and Haying.

THE Department of Agriculture has collected figures to show how much one man or one horse should accomplish at handling hay or grain crops. The following statistics are supposed to give what is called a normal day's work. At harvesting grain with a tender or header the net hours in the field for one day averaged 10⅓ hours:

IMPLEMENT	Width of implement Feet	Number of horses generally used	Harvested per day Acres
Grain binder	5	3	9.26
	6	3	10.96
	7	4	15.24
	8	4	18.19
Grain header	10	6	24.18
	12	6	28.56
	14	6	28.46

At shocking grain the following figures were worked out—a "day" representing 9.91 hours.

YIELD PER ACRE	Shocked per day Acres
1 to 20 bushels	10.09
21 to 40 bushels	8.73
41 to 60 bushels	8.46
61 bushels and over	7.36

In regard to mowing it was found that the most efficient width of the sickle bar in the mower was seven feet. The following figures are based on a day in the field:

OPERATION	Most Common width Feet	Number of horses	Acreage per day
Mowing	5	2	8.85
Raking	8	1	11.99
	10	2	17.91
Tedding	6	1	9.75
	10	2	15.88
Cocking (1 man)	..	..	6.29

So now, if you think figures would stimulate the hired man, let him drink these in.

New York State News.

SULLIVAN PROBERS QUIT.—A committee was appointed in the Assembly last Winter to investigate graft in the Highway Department. It was known as the Sullivan committee. Assemblyman J. L. Sullivan being its chairman. But an investigating committee without funds to carry on the investigation never gets far, and as the Legislature failed to give the committee any money and as it could not get any from private sources, the committee has gone home and it is probable that there will be no more meetings this Summer and possibly not at all.

HOLSTEIN-FRIESIAN ASSOCIATION.—Syracuse will have the annual convention of the Holstein-Friesian association again in 1915. It was so voted at the annual session held last week in Chicago. It was agreed to hold the convention alternately between the East and the West. Wing R. Smith was re-elected treasurer and Albert K. Brockway was made a member of the board of directors.

STATE SEALERS.—The annual convention of the State sealers of weights and measures will be held in Watertown on June 24 to 26. A long list of speakers is announced and a profitable session is anticipated. The delegates will visit the large paper mills in the vicinity, take a trip to the Thousand Islands and be otherwise entertained.

INSTRUCTION IN APPLE PACKING.—The New York Central will coöperate with the State Agricultural department in operating a train for the demonstration of apple packing methods to comply with the new law. These trains will be run through the fruit regions of Western New York, and one car will be devoted to the demonstrations while the other will be used for the purposes of the lecturers who will accompany the train.

FINE PEA CROP.—One of the finest pea crops ever grown in the vicinity of Batavia will be that of the present season. The same may be said of the spinach crop. One canning company has, it is said, 1,400 acres of peas growing and of uniformly fine appearance. Several thrashers are now being made ready for the work of thrashing out the peas, and have been stationed on farms where the peas are grown and also at the factory at Batavia.

NEW LAWS.—Gov. Glynn signed this week four bills passed at the special session of the Legislature. One authorizes the Governor to direct the State Comptroller to borrow $100,000 for the use of the National Guard should it be called out for service. Another bill appropriates $225,000 to pay the interest accrued on certain State highway improvement bonds. Another reappropriates unexpended balances of the highway improvement appropriations aggregating $1,045,000, and appropriating $2,227,255 for the canal sinking fund.

CONFERENCE ON MILK PROBLEMS.—It is announced that arrangements are being made by the officials of the New York Milk Commission, in conjunction with representatives of the Dairymen's League, to hold a national conference of milk producers, dealers, consumers and health departments at Atlantic City on June 22.

THE GRANGE HONORED.—The Grange of this State as well as its chief representative, State Master W. H. Vary, have been honored by his nomination, which is said to be equivalent to an election, as a director of group 3 of the New York Federal Reserve bank.

FORESTRY COLLEGE FACULTY.—The faculty of the State Forestry College at Syracuse will be materially strengthened by the addition of three new men who were elected this week. They are Dr. C. C. Adams, who will become assistant professor of forest zoology. He comes from the University of Illinois. Prof. Fred J. Baker was chosen professor of forest products. He is at present studying at the University of Munich, Germany. He is a brother of Dean Baker of the college. Prof. E. F. McCarthy was made director of the college's Ranger School at Wanakena to succeed R. P. Prichard who will become an instructor at the college. Louis Marshall of New York was re-elected president of the board, Congressman John R. Clancy was chosen vice-president and former senator Hendrick S. Holden treasurer. James S. Whipple, president of the State forestry association, is quoted as saying that the State should add 1,500,000 acres to its forest holdings. "The two great things in forestry work today," said he, "are better fire protection and the extensive planting of trees." J. W. D.

Government Crop Report.

THE Winter wheat harvest is now under way with prospect that the large early estimate, 638,000,000 bushels, will be reached. The Spring wheat outlook is 95.5 per cent. of normal, two points above last year. The total area in all wheat is 53,377,000 acres, 3,200,000 more than last year, and the entire crop is expected to reach 900,000,000 bushels.

In oats there are 38,383,000 acres, condition 89.5, indicating 1,216,000,000 bushels. Barley, 7,528,000 acres, condition 95.5, probable yield 206,000,000 bushels. Hay 88.7 per cent. or 1.2 above last year.

Following is the estimated yield of the chief Winter wheat States: Kansas, 148,000,000 bushels; Nebraska, 65,000,000; Indiana, 42,000,000; Oklahoma, 41,900,000; Illinois, 41,800,000; Ohio, 37,800,000; Missouri, 36,700,000; Washington, 32,100,000; Pennsylvania, 23,200,000; Texas, 16,900,000; Michigan, 15,900,000; Oregon, 15,000,000; Montana, 13,000,000; Iowa, 10,800,000; Kentucky, 10,400,00; Idaho, 10,100,000; Virginia,9,400,000; Tennessee, 8,600,000; California, 8,100,000; New York, 7,700,000; North Carolina, 6,300,000. Following are the Spring wheat estimates: North Dakota, 85,600,000 bushels; Minnesota, 63,800,000; South Dakota, 46,200,000; Washington, 21,300,000.

Ohio Crops.

THE Ohio Agricultural Commission gives the following crop figures for that State, the report being made June 1:

Wheat—Prospect compared with normal yield	103 per cent.
Original area seeded	1,635,185 acres.
Area abandoned this Spring	1,754 acres.
Area remaining for harvest	1,633,431 acres.
Oats—Prospect compared with normal yield	83 per cent.
Rye—Prospect compared with normal yield	96 per cent.
Winter Barley—Prospect compared with normal yield	93 per cent.
Spring Barley—Prospect compared with normal yield	87 per cent.
Clover—Prospect compared with normal yield	88 per cent.
Timothy—Prospect compared with normal yield	88 per cent.
Damage by grub	3 per cent.
Hogs—Fed for Summer markets	54 per cent.
Condition compared with an average	95 per cent.
Spring Pigs—Number saved compared with an average	86 per cent.
Sheep—Condition compared with an average	96 per cent.
Lambs—Number saved compared with an average	94 per cent.
Fruit—Prospect compared with normal yield	81 per cent.

AVERAGE PRICES.

Per bushel—wheat 93 cents; corn 73 cents; barley 63 cents; oats 44 cents; rye 71 cents; potatoes 90 cents.
Per ton—hay $13.05; Alfalfa $15.34.

Woman and the Home

From Day to Day

Pittypat and Tippytoe.

All day they come and go—
Pittypat and Tippytoe!
  Footprints up and down the hall,
    Playthings scattered on the floor,
  Finger marks along the wall,
    Tell-tale smudges on the door;
By these presents you shall know,
Pittypat and Tippytoe.

How they riot at their play!
And a dozen times a day
  In they troop, demanding bread—
    Only buttered bread will do,
  And the butter must be spread
    Inches thick wih sugar, too!
And I never can say "No,"
Pittypat and Tippytoe.

Sometimes there are griefs to soothe,
Sometimes ruffled brows to smooth;
  For (I much regret to say)
    Tippytoe and Pittypat
  Sometimes interrupt their play
    With an internecine spat;
Fie, for shame! to quarrel so—
Pittypat and Tippytoe!

Of the thousand worrying things,
Every day recurrent brings!
  Hands to scrub and hair to brush,
    Search for playthings gone amiss,
  Many a wee complaint to hush,
    Many a little bump to kiss;
Life seems one vain, fleeting show,
To Pittypat and Tippytoe!

And when day is at an end,
There are little duds to mend;
  Little frocks are strangely torn,
    Little shoes great holes reveal,
  Little hose, but one day worn,
    Rudely yawn at toe and heel!
Who but you could work such woe,
Pittypat and Tippytoe?

But when comes this thought to me:
"Some there are that childless be,"
  Stealing to their little beds,
    With a love I can not speak,
  Tenderly I stroke their heads—
    Fondly kiss each velvet cheek,
God help those who do not know,
A Pittypat and Tippytoe!

On the floor and down the hall,
Rudely smutched upon the wall,
  There are proofs in every kind
    Of the havoc they have wrought,
  And upon my heart you'd find
    Just such trade-marks, if you sought;
O, how glad I am 'tis so,
Pittypat and Tippytoe.

—Eugene Field.

*

DURING the cherry season you should have at least one cherry cobbler. Line a deep baking dish with rich pie crust, giving an ornamental finish around the edge. Middle West housekeepers like a square enameled pan for this. Wash, stem and pit enough ox-heart cherries to fill the dish three-fourths full, mixing in plenty of sugar (about two cupfuls) before putting the fruit in the crust. Cut strips of the crust one inch wide, and put in a lattice over the fruit. Bake till well done in a medium oven and serve with cream, whipped if you prefer it.

*

THE mother of one active little two-year-old says that the baby's red cap and sweater serve a very useful purpose in enabling her to keep track of the child. She can catch the gleam of red even when he is in the farthest corner of the door-yard, and the color shows up among bushes, so that he is visible when duller colors would tend to put him out of sight. We never thought of this idea before, but it seems to us a very good one. Khaki and the various dim tertiary colors provide "protective coloration" for an army in the open field, but they may also cause a little runaway to melt apparently into the surrounding field just at the moment when his anxious mother is straining her eyes for a glimpse of him.

*

THE season for prickly heat, hives and similar afflictions opened early this year, during the warm humid weather of May. One can get a good deal of misery out of these ailments, though they are so trifling in themselves. For hives, our usual treatment is to sponge the surface with a teaspoonful of baking soda in a cupful of warm water, or to moisten the eruption freely with sweet spirits of nitre. A dose of magnesia internally is helpful. There are, however, chronic cases of hives, resulting from conditions that need skilled medical care; for instance, some forms of gout. Prickly heat, in which minute vesicles form on the skin, accompanied by extreme pricking irritation, is common to newcomers in the tropics, and is not uncommon here. When it exists, coarse or harsh soap should not be used, and the skin should be well dusted, after bathing, with antiseptic powder, such as borated talcum. The itching is relieved temporarily by a carbolic acid lotion. Rough underwear, hot drinks, violent exercise, or anything that induces excessive perspiration increases the trouble. Painting with iodine is also recommended, but we would rather not use it without the doctor's recommendation.

*

DURING the past nine years the Travelers' Aid Society of this city has definitely helped 82,382 persons, and has incidentally helped many others. The aim of the society is the protection of persons traveling alone, but especially young women, boys and girls. We think that the work of this society ought to be better known in country districts, because of the protection it offers to strangers coming to the city. There is an agent of the society at each of the large railway terminals here, and any of the coast and river steamers will be met by appointment. The great transatlantic steamers are always met by these agents. Any woman who finds herself in need of counsel or aid can secure it from these people, and the moral protection given often means much more than material help. Many and terrible are the dangers of the city for the ignorant and inexperienced. The society's headquarters are the Travelers' Aid Society Building, 465 Lexington Avenue, New York, and this is an address which should be filed away carefully by rural pastors, Granges and local societies, since it may sometime be needed in a sudden emergency. If notified in advance the society will send an agent to meet young women or children on their arrival in this city, in cases where there is no one to see that they reach their proper destination in safety.

Seen in New York Shops.

"PARTLY-MADE" sport skirts are accordion pleated, attached to a waistband and with the hem turned up, but the back seam is merely basted, so that the skirt can easily be adjusted to fit. They are offered in serge, black, navy blue and white, and in black and white check; price $4.50 each.

Tango necklaces are composed of ribbon links separated by groups of beads, and finished with tassels of silk or beads, the necklace being bust length. The ribbon links may be of satin or velvet one-half to three-quarters of an inch broad, and folded under into a "V" at the ends, where the beads are attached. As an example, a necklace seen was made of three six-inch links of black satin ribbon united by links composed of small beads, lapis and cut jet alternately, within the center a long oval amber bead. The two ends of the necklace, which are not united, were finished with a one-inch length of the small beads, passing into a flat oval plaque of amber, with a black silk tassel at the very end. Italian porcelain beads, which are decorated with gay colored flowers, are often used in these tango necklaces, as well as alone, or mixed with crystal beads. Opaque beads always look better with a touch of crystal to give them sparkle. Oriental prayer beads, often gorgeous in coloring and finished with vivid silk tassels, are offered with the others. Some of them consist of carved or painted beads, separated at intervals by a carved bead of odd shape, such as a fish, an elephant, a pagoda, a mandarin, etc. Kimono bangles from Japan are bracelets of carved sandalwood beads, fastening with a gay tassel; they cost 75 cents each.

Beach sweaters of Angora wool cost from $7.50 to $15. They are made with a V-shaped neck and rolled collar, turnback cuffs, patch pockets and belt. They are made in all sorts of vivid colors. Beautiful sweaters are of knitted silk, orange, old rose emerald green, royal blue, etc. Scarves or mufflers are made to match both silk and wool sweaters. There are also many models of spencers or tight-fitting sleeveless jackets knitted in Shetland wool, which are intended for mountain and seashore wear.

Hats of hemp or split straw in the dark brown known as tete de negre are considered good style, with blue or green suits; they are usually self-trimmed, but sometimes with metallic dark blue, green or black plumage. Blue or green hats are often quite unbecoming, while this peculiar dark brown seems to brighten the complexion of the wearer.

A pretty "tub dress" was of colored cotton crape with a tight underskirt, and above it a flaring overskirt attached to a deep yoke pointed over the hips. The waist was a loose blouse with elbow sleeves having turned-back embroidered white cuffs, and a square rolling collar, open in front, to match the cuffs.

Some very smart waists seen were of striped crepe de chine—hair line stripes of dark blue, red or black one-fourth inch apart. The waists were very plain, with raglan sleeves of full length, and had flaring collars and turnback cuffs of hemstitched white organdie.

"Neck girdles" costing from 10 to 25 cents, consist of silk cord, about the thickness of lead pencil, finished with tassels at the ends. They are made in a great variety of colors, and are either worn around the base of a flaring collar, like a necktie, or run through a casing around the neck of a shirred blouse.

A very smart blouse was made of canary yellow handkerchief linen, cut in raglan style, with collar, cuffs and vest of white pique. Around the collar and cuffs were loops through which narrow black moire ribbon passed, tying in a bow at the side of the cuff, and in front of the collar.

The new skirts are much shorter than they have been, not only clearing the ground all around, but in many cases being not more than ankle length, or even a little above. This is a decided change from the long clinging model, but has the merit of good sense. The short skirt has an awkward look, however, when there is a good deal of drapery above.

The varnished effect in millinery, noted in varnished straw hats and glossy ribbon, has been carried to an extreme. We have seen some of the small wings used in trimming varnished to the highest degree of stiff shininess, the feathers firmly stuck together by their coating. They were durable, but might as well have been made of papier-mache as far as looks were concerned. The small wings, standing at right angles on crown or brim, are even smarter than flowers this season.

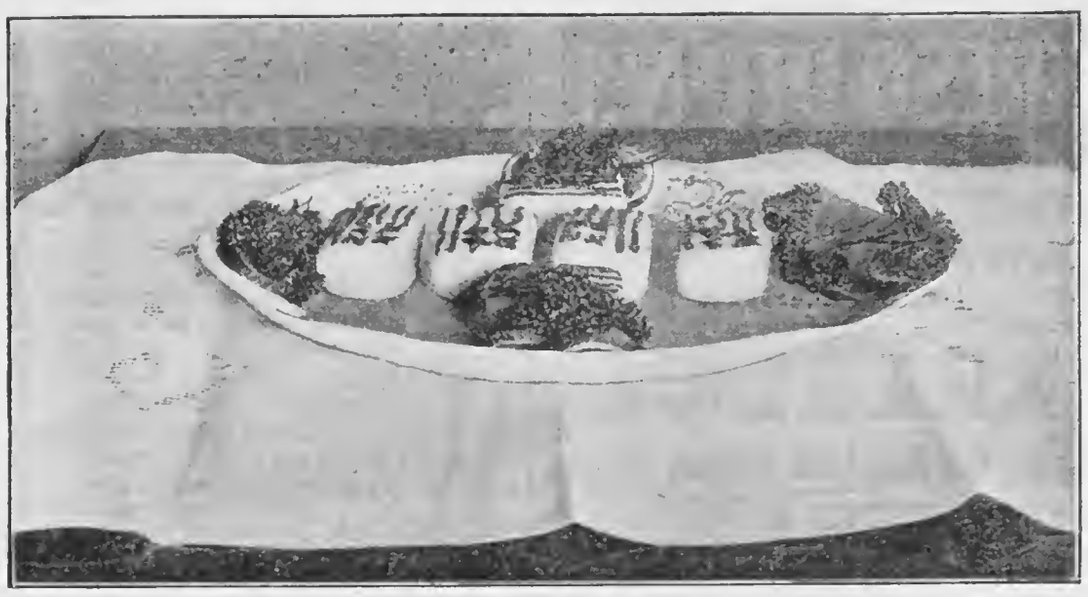
A July-day Celebration Dinner.

A LUNCHEON or little dinner party, where the sentiment of the day has been successfully carried out, offers a happy medium in which a hostess may show her patriotism on July-day without too much rejuvenating. Serve it out-of-doors, of course, if there is a good place for it, and have a little display of fireworks at the close of the evening, or if the dinner is to be in the middle of the day, and there can be no fireworks, there



FISH CROQUETTES, INDEPENDENCE STYLE. FIG 335.

might be a short patriotic speech by the orator of the party, or a few appropriate recitations by one or more of the guests, and some national hymns sung.

If there is not a garden or a desirable porch, any good-sized dining-room may be made very attractive with the aid of flags, red, white and blue bunting, and ferns. Decorate the walls with the bunting, or crepe paper in these colors can be used. For the table decorations shown here, cover the table with a plain white damask cloth, and in the center place a medium-sized window-glass, with a piece of green crepe paper the same size beneath it, and conceal the edges with daisies, or made. The same kind of heavy white paper that formed the tents was used for this. The shade and standard is cut in four sections, and decorated with flags, cut from the flag-designed crepe paper; they are then fastened together by means of little brass paper fasteners. Four narrow strips of the paper holds the top and base together, and a square piece of heavy card-board, with an incision cut in the center large enough for a candle to fit in without slipping, is placed on the top of the base just beneath the shade.

As for the menu, this, too, may have a touch of patriotism about it, as

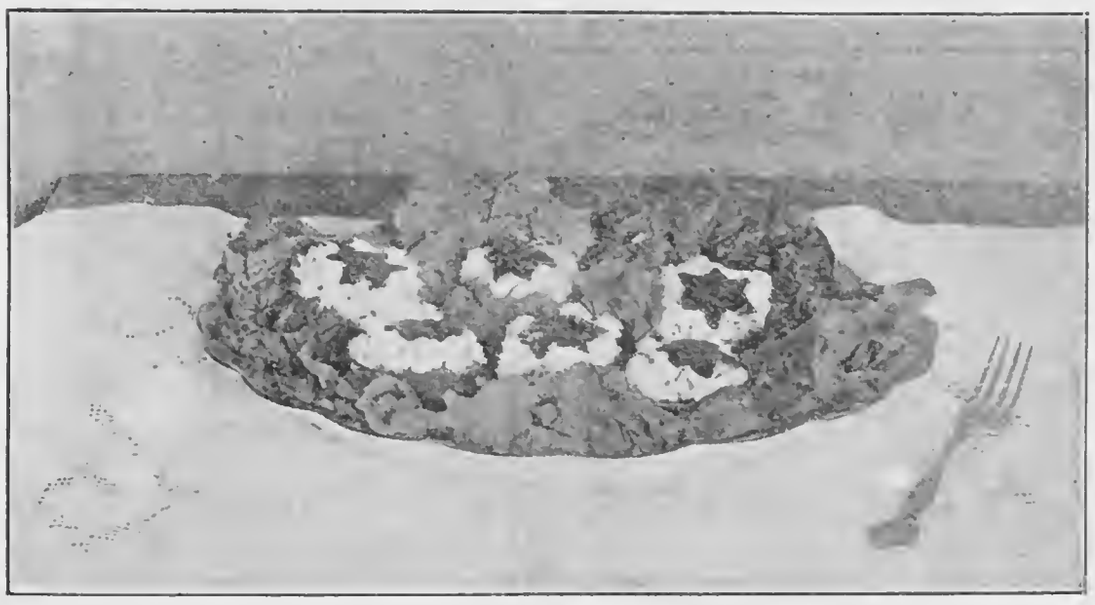
Washington coupe (cherry cocktail)
Soup, if you like
Radishes Pickles
Fish a la Independence cucumbers
Southern fried chicken; peas, creamed new potatoes
Star salad rolls
Mount Vernon cream (plain vanilla ice cream decorated with candied cherries)
Martha Washington cake
Rebellion punch (raspberry shrub)

The cherry cocktail is made from a quart of ripe red cherries. Wash, stone,

DECORATIONS FOR INDEPENDENCE DAY DINNER. FIG. 336.

blue cornflowers, and green leaves.

From a piece of heavy white paper make a miniature army tent, add a tiny silk flag to the top, and place this near the center of the glass, then arrange around it half-a-dozen, or more, according to their size, toy soldiers. Instead of place-cards there are little peaked tents with a small flag floating from the



A PATRIOTIC STAR SALAD. FIG. 337.

peak, and the name of the guest written across the front. The place favors are small drum-shape boxes covered with red, white and blue paper, and filled with red and white bonbons.

The candle shades are very attractive and quite new, the one in plain white with the simple flag decorations is home-

and chill them; put them into star shape paper cases, or sherbet glass, and cover with a mixture of one teaspoonful of lemon juice, one tablespoonful of orange juice, and one tablespoonful of powdered sugar.

For the fish course mix a little salt, a speck of cayenne, and one and one-half cupfuls of white sauce; then add two cupfuls of flaked cold boiled white fish, and the beaten yolks of two eggs. Shape the mixture into flat oblong croquettes, egg, crumb, and fry in deep fat, then drain on a napkin or soft paper. In the meantime cut red or green peppers into thin strips and tiny stars, and ornament each croquette with these, flat fashion. Arrange on a hot platter with parsley or cress, and serve with a rich cream sauce, to which a little lemon juice has been added, and sliced crisped cucumbers dressed with a French dressing.

If the weather is very hot one might prefer a cold meat course, in this case the chicken may be prepared the day before it is needed, in this way. Clean and cut up two young fowls, and cover with cold water, adding a little chopped carrot, onion, and celery, with one bay leaf, three whole cloves, six peppercorns, and one tablespoonful of salt. Heat, and cook slowly until tender; then remove the meat; take out the bones and chop. Reduce the stock to one pint, and cool it; then skim off the fat; reheat, and strain over one teaspoonful of dissolved gelatine. Season with a little pepper and a few drops of onion juice, and add the chopped meat. Pack in a plain mould, and chill. Serve thinly sliced, garnish with parsley or cress.

The salad is simply cream or cottage cheese, seasoned and moistened with French dressing, then heaped lightly on slices of tomato, and the top ornamented with a star cut from red pepper. Each slice is placed on a crisp lettuce leaf, and more of the dressing is poured over all.

ROSAMOND LAMPMAN.

Two Favorite Desserts.

Sour Cream Pie.—Mix together one cup of sugar and one cup of raisins, then add one egg, a pinch of salt, one teaspoon each of cinnamon and allspice, and one-half teaspoon cloves. Mix all these ingredients thoroughly, and stir in one cup of sour cream. Bake in one crust, and when cold cover with whipped cream flavored with vanilla. These pies will keep several days by omitting the whipped cream until ready to serve.

Tapioca Pudding.—Soak two-thirds of a cup of tapioca over night. In the morning, cook in water until clear, then add one quart of milk. Let come to a boil and add two eggs, beaten light, two-thirds of a cup of sugar, two tablespoonfuls flour. Flavor with vanilla. Set away to cool and then place in individual dishes and cover with a tablespoonful of canned strawberries and whipped cream on top. The beauty of this is to have it as cold as possible.

IT is not written, blessed is he that feedeth the poor, but he that considereth the poor.—Ruskin.

Trespassers are not all on the ground

Air trespassers, like rain, fogs, frost and snow, that swell and rot all exposed wood, are excluded by paint, mixed for the job, of

Dutch Boy White Lead

and Dutch Boy linseed oil. White lead paint grips every wood pore; coats a house with a preserving paint armor; beautifies for years. It can be tinted any color and mixed by yourself or by your painter.

Red lead—best for implements and metals—also comes in a paste form that doesn't harden in the can. Ask your dealer.

TAPPING A BLOATED ANIMAL.

EVERY owner should have an idea how to tap animals when one of them is unfortunate enough to suffer an attack of bloating from acute indigestion. Medicines are of course useful in this complaint, but will fail in many cases where the urgency is great from such severe extension of the intestines with gas that death would follow were not mechanical means adopted for the relief of the patient. The instrument proper for the operation is a double one, the "trocar," a dagger-like probe with handle, and fitted intimately into a tube called the "canula." The trocar is forced into the intestines through the abdominal wall, a preliminary cut having been made with a small, sharp knife to allow the point of the instrument to enter the skin. When the trocar and canula have been introduced the full length, inwards, downwards and forwards, the canula is held in place by the thumb and fingers and the trocar withdrawn. If gas does not come at the first operation it is often possible to find the gas by partially extracting the canula and then introducing it at a different angle. Sometimes in tapping horses fluid comes through the tube and this is even more commonly seen in cows. It shows as a rule a very bad condition of the stomach in the cow or intestines in the horse, and indicates that the indigestion is acute. Caution must be taken where this fluid exudes, for if the canula has to be withdrawn when gas has ceased to flow and the trocar is not first inserted in the tube the latter will draw up fluid by capillary attraction and be apt to deposit it between the abdominal wall and the intestine or stomach as the case may be. When this happens the fluid with its decomposing matters acts as a foreign body and is sure to set up trouble, such as an abscess, which is a rather common and very troublesome sequel to a badly performed operation.

The horse is to be tapped upon the right side in the space between the point of the ilium, last rib and spine. This is the space where the hair grows in opposite direction to the hair on the sides. Select a spot high up to the outer edge of this "cow-licked" hair towards the direction of the animal's head. Let it be high, for if chosen too low an artery is apt to be struck, and there is also thicker muscle, and an abscess is therefore more liable to be caused. Clip hair from a small place, then cleanse with antiseptic and water. Any effective antiseptic will do, such as carbolic acid, or any one of the tar product disinfectants. Now cut a small slit large enough to accommodate the point of the trocar and then sharply thrust it downwards, inwards and forwards the full length, and this done slowly remove the trocar, leaving the canula in place.

Cows and sheep are tapped upon the opposite side from horses. The spot to tap, upon the left side in cows and sheep corresponds to that in horses being between the point of the ilium, last rib and spine in the depression usually found in that part. As a rule a mistake is made in tapping cows. The text books say to measure a span each way from the point of the hip bone, last rib and spine. This is fairly correct, but will make the incision come too low. Tap as close to the spine as possible aiming the trocar straight downwards, inwards and forwards and of course being particular in no way to touch or injure the spinal processes. In cows this high tapping prevents flow of blood, removes gas when low tapping would fail, and is far less likely to be followed by an abscess than low tapping. Stand on the other side of the cow when making the incision through the skin and introducing the trocar, else there will be liability of receiving a kick. In horses place a twitch on the nose before tapping, unless there is great urgency, as is sometimes the case.

After removal of the trocar and canula in all animals cleanse the wound and bring its lips together by manipulations with the fingers, then dust freely with iodoform. In cows, where the wound is larger than in the horse, it is well to introduce a pin, as is done after bleeding, and then wind a small string around it in figure 8 fashion. In cows it is often well to tie the canula in place for 12 hours or even longer, until all trouble has subsided.

A. S. ALEXANDER, M. D. C.

GOOD TYPE OF COACH HORSE. FIG. 338.

Green Feed for Hogs.

IS there any objection to "soiling" hogs using freshly cut peas and oats, Alfalfa, Soy beans, cow peas, clover and even green fodder corn? Would there be any danger of bloating? J. S. C.
Goshen, N. Y.

There is no objection to practicing the soiling system with swine, and there is absolutely no danger of bloating. Alfalfa is the source of one of the very best soiling crops, and can be used extensively in pork production. If rape and Sweet clover are used the area can be safely pastured when the plants are from eight to nine inches high, and if they are put in in rows it is probable that this pasture is equally as economical as the soiling system if one takes into consideration the cost of harvesting soiling crops. As to the amount of such feed that may be fed it would be a safe rule to give the animals all that they will eat with relish, although it is understood that this is not a fattening ration, and if it is intended to fatten the animals it is necessary to use some corn and tankage, or some corn, molasses and tankage in addition to the green crops. The use of soiling crops would be of the greatest advantage to breeding animals, especially brood sows and their pigs, particularly if the animals are given cool quarters and the green forage provided regularly in reasonable amounts. It is doubtful whether Soy beans or cow peas would make good soiling crops inasmuch as they do not yield in proportion to the amount of corn, and a very good use of the corn and Soy beans is where both are planted at the same time, and the animals turned in to harvest the crop early in September. We find that rape is one of the most satisfactory crops that we can grow for swine feeding to supplement corn, as it is not only economical, but a crop that can be seeded at any time during the Spring up to August 1, and one that is not only palatable, but satisfying to the animals.

DAIRY CATTLE

To anyone interested in improving his herd of dairy cattle by the addition of some rich Jersey blood, I will, on request, send free a handsome large picture of **Julia's Majesty**, A.J.C.C., 89717, together with his full pedigree and description.

We have a few of his sons, from four months to a year old, that we will sell at very low prices. These animals are good enough to go in any herd, as they are from Register of Merit dams producing from 400-lbs. of butter per year upward and of splendid breeding and type—many of them imported from the Island of Jersey.

WM. M. HARRIS,

Telegraph and Telephone Branchville, N. J. — **Deep Spring Farms, Walpack Center, N. J.**

FARVIEW ADMIRAL WALKER GELSCHE 71,144. No finer-bred Holstein bull in State. Reasonable to quick buyer. **J. S. BROWN, Black Hall, Conn.**

FOR SALE—REGISTERED Holstein Yearling Bull—Sire, Prince Calamitus; grandam, Calamity Pietertje De Kal, whose record is 84½ lbs.; first premium cow at Danbury Fair, 1913. Also registered Yearling Boar. **ARROWPOINT FARM, New Preston, Ct.**

HORSES

HIGHLAND VIEW STOCK FARM

Our last importation of BELGIANS and PERCHERONS is the BEST we ever imported. We have sold more Stallions and Mares in the last sixty days than we ever sold in a year. WHY? Because we sell the good, big, drafty kind at the right price, and cheaper than the other fellow.

THE RURAL NEW-YORKER, 333 W. 30th St., New York

Overdose of Tuberculin.

WOULD a cow tested for tuberculosis that had an over quantity of tuberculin injected show an increased temperature even if sound? Our dairy of 36 cows was tested about a week ago by local veterinarian, only one showing an increased temperature (106 deg.). I have a slight suspicion the proper quantity was not used in her case; she appeared a bit stiff the day after test, especially in near fore leg. She is the most thought of cow in dairy, and we should be sorry to lose her. She stood test all right February, 1913. How soon could she be tested again? C. H.

An excessive dose of tuberculin would not produce the rise in a cow's temperature characteristic of tuberculosis; double the usual amount is used when occasion demands it as when, after repeated tests, the animal's system becomes more resistant to its action. The length of time which an injection of tuberculin will prevent reaction to a subsequent one is a variable one, but it is customary to make re-tests after six weeks. There are several conditions which may prevent reaction in a tuberculous animal and only repeated negative tests at considerable intervals can be considered positive evidence of freedom from the disease.

M. B. D.

Milking Fresh Cow.

I would like J. Grant Morse to explain why he drew so little milk from his cow's udder at first. R. E. P.

I did not milk my cow out clean at first because I was afraid of milk fever. The doctors think that this disease is caused by the sudden change or shock to the cow's system. The milk is secreted from the blood by the gland known as the udder. Our best cows secrete an enormous quantity when they first freshen and before they freshened they were secreting none at all. So it is a general practice among the "men who know how" to draw but little milk at first, and so hold in check the secretion until the system can adjust itself to the change. Will Dr. Alexander give this thing to us so that we can all understand it?

J. GRANT MORSE.

Age of Cattle.

How can the age of a cow be told when she has no horns? W. K.

By her teeth. Any expert can give you instructions, or you can get them from a veterinary text book. A. S. A.

Salivation.

I have a horse that when she eats her corn scatters about a half gallon of water. Do you know any remedy for it? New York. F. G.

A diseased molar tooth, or sharp teeth, or a sore tongue or the presence of stones (calculi) in the salivary ducts, are causes of such profuse flow of saliva. Have a qualified veterinarian make an examination. A. S. A.

Grass for Work Horses.

Which is better for horses that are kept at work all the time except Sunday, to feed a mixture of corn and oats with Timothy and clover hay, and keep it at night and Sunday, or feed grain and turn out at night on blue grass pasture? Of course if they are turned out at night they will have what hay they want. Virginia. F. D. W.

Hard worked horses do best when fed hay, oats and bran, without green grass, if the owner can afford such feeding. Grass tends to loosen and soften a work horse, but most small farmers allow their horses to pasture when possible, and claim to have seen no ill effects. If grass is to be used give it every day, not at irregular periods. A. S. A.

Dropsical Swellings.

Some of my sheep have a swelling under the jaw. The swelling seems soft at first and then becomes hard. I have lost several from this in other years. In other sheep it gradually disappeared. What is the remedy? I do not find the disease mentioned in any of the books on sheep. New York. H. W.

The swellings do not constitute a disease, but merely indicate anemia (bloodlessness) from the ravages of intestinal parasites, or some other debilitating disease. On general principles medicines to destroy worms should be administered. A tablespoonful of gasoline in new milk is appropriate and may be repeated two or three times at intervals of two days. This kills stomach worms, or drives them out of the sheep. If tape worms are present freshly powdered kamala in a two-dram dose is best. It is administered after starving the sheep for 18 hours or more. Generous feeding is indicated in all such cases, and the sheep should have new grass, rather than old, tainted pastures. A. S. A.

THE MILKING MACHINE SAVES DAIRYING

IN most arguments pertaining to machinery, the first consideration is the cost, but with the power milker the cost seems to me the last point of argument, so will consider the many-sided question of getting the milking done in a regular, gentle and economical way, with considerable emphasis on the *gentleness*, which means more milk on less feed; fewer cows for the butcher, and less for the soap-fat man.

ADVANTAGES OF THE MACHINE.—The first side to consider is satisfaction of having three dependable milkers, more reliable than the owner, the superintendent, or manager. It is more reliable than any hand milker, no matter what his title may be; three milkers always sober, even-tempered, up on time every morning, will not smoke or carry matches in the barn, no beating cows with stools or clubs, no profane, loud talk among the cows, no holidays off on every other Sunday or more. Just consider a Sunday evening in August, 99 degrees in the stable, 25 cows to milk, no one shows up to help. I know how you feel like asking the good willing wife to help. I know how she has been asked many times before. It means one hour or more of hot work with the cow's tail around your neck or in your eye most of the time. That is one side, the old way. The new way, after you start engine, get milkers adjusted, feed cows, the good wife comes out without changing any clothes, stands by the door or window, waiting to assist carrying the milk to cool, while you attend the three units, which do the hot job in between the cows just as quickly as any three men in the neighborhood, without using any language which would not be fit for your wife or children to hear.

RELIABILITY seems to come next. Is any machine perfect, never wearing out or occasionally breaking some part, or getting out of adjustment? Has the binder, mower, or potato machinery been discarded because it broke down when in the midst of harvest? Did you take your wind pump down because it got out of order? Has the general use of machinery been checked because they break a 25-cent part? The same has to be considered with the milker. But say you have three units or more; if one does get unmanageable or give out in a busy time, you still have two others. Can you say that of all your machinery, or any part of it? We have none here that will interchange parts and still work like the milker. Personally I believe there are more man or manager failures than real machine failures; close observation and also records kept by the P. R. R. Company show that 70% of the failures on locomotives are due direct to the man and not the mechanism. The milker is able to duplicate the calf on all teats at one time without the butt, when no more milk is to be had.

INITIAL COST AND UPKEEP.—We have not been using one long enough to find out the upkeep. I do know that it is made of non-corrosive metal and rubber, and believe many parts will last for a generation. Like other machines, in one man's care lasts many times longer than in other hands. As I understand this side of the question, there has been a slight advance owing to more expensive material used and a greater demand, showing positively that they are filling the place of hand milkers in many dairies. The price depends on the number of units, also on amount of piping necessary to reach the power room.

RETURNS FROM INVESTMENT.—Yes, that's what we are farmers for, trying to get returns from the soil by using fertilizer and seed, and doing most of the work with machinery. Why? Because it is cheaper and increases the returns. I do not know much about the banking or commercial world, but they are after the returns just the same. Returns from the milker investment can be figured in many ways, so will just note a few as I see them: First, cost of our equipment $510, February 1st, 1914, and for easy figures will say interest $30. It is satisfaction to know one can get done milking before dark, and when help all take a day off, and not start at noon, it is worth $100 per year. Another way of getting returns: One man and team can stay one hour longer in field during one hundred busy days at 30 cents per hour, which means good interest. Another way, in Winter season can do with one man less, wages and board ($35), make $105. That will more than pay for gasoline and other oils for two years.

THE COW'S OPINION.—The cows can answer a number of questions in reference to the milker after the first week of use, and the principal one is, that she likes it better than hand milking, and you know what that means in the pail and in the pocket or bank or automobile, whichever you choose. Compared with other machinery, as to cost and hours used per year, take the reaper and binder at a cost of $125 new, used about 30 hours per year, about $4.16 per hour's use in the field. The milker will be used about 730 hours per year, or 70 cents per hour's use in the barn, and you can compare it with almost any machine, and will find it is the most used compared with the price of any implement on the farm. D. S. CROSHAW.

New Jersey.

COW KEEPING IN NEW ENGLAND.

THERE is quite a general opinion broadcast over New England that the number of cows in Massachusetts and also in the other States that largely supply Boston market with whole milk are decreasing at the rate of about 5,000 yearly. It has been officially stated that the above figures are correct in Massachusetts and New Hampshire. It is a fact that the number as a whole is decreasing faster than is good for us, but I think the decrease has been overrated, for this reason: In a neighboring town about 30 farmers who formerly produced milk are not doing so now, but on the other hand those who are producing have in many cases doubled their capacity, which would make up to a certain extent the loss, or part of it at least, from the non-producing farms. One of the largest producers of this town gave a general talk on the milk producing question at a farmers' club the other evening, and some things he said are worth noting. His advice on farm improvement is to do what is needed in a common sense way; always keep to the practical. A barn with a cellar can and should be kept so it is as healthy as any other, and the cows can be kept cleaner if anything than in a ground floor barn. It is not always, in fact seldom, good policy to follow wealthy people's ideas in barn building. Give plenty of space in all ways possible. A good handy trough is better than individual cups, and can be more easily kept clean and sweet. An important point is to allow no diseased cow in the barn, know that all the cows are healthy. Go high in building to give plenty of overhead space for hay and fodder.

It pays to raise your own stock and breed up. A good sire should be kept as long as possible. It pays to keep records of all cows and know just what they are doing. One bull, apparently a good one, did not produce good calves, as only one of this class was obtained from him; the rest all had some fault or other. As soon as this was discovered he was passed. Cow-testing associations are good things, and prove the cost of producing from the various cows. Including all feed, the association found for him that one produced her milk for 2½ cents per quart, while another cost four cents per quart. It was very important to know of this.

It is important to raise everything on the farm that is possible, both stock and feed. Corn silage is the best main feed for cheapness and results, but it should be good silage. A great saving is made by buying grain by car lots if possible. A good ration, also an economical one, is 200 pounds gluten, 100 pounds cotton-seed and 100 pounds bran. This is fed by the writer with good results also, only I feed a little cornmeal to some cows with it; that is, those that lose flesh when milking heavily. Clover and Alfalfa are the best kinds of roughage feed. oats and peas, one of the best green feeds; Winter rye is an excellent crop, both for feed and plowing under, and is used heavily for this purpose on the farm. Millet is also a good green feed, but Hungarian is better for hay than any of the others, and is also good feed for horses. However, the corn crop must be our standby, and sweet corn is raised to good advantage. Sell the ears if you have a market, if not feed them.

Several years ago a good profit could be made by retailing milk at five cents per quart, but at present, as conditions now are, this figure should be obtained at wholesale to make any headway whatever. An 18 or 20-quart cow must be fed 12 pounds of union or 10 pounds of heavier grain to keep up the flow. A cow should give 8,000 pounds per year to keep for profit. One cow gave a profit above feed of $173 in a year, another only $32. A cow which produced 12,000 pounds of milk per year cost 1½ cent per quart for feed. One that produced 6,000 per year cost three cents per quart. It was found that $9 per year was about the right figure for depreciation of a good cow. The above remarks contain both truth and common sense, and coming from a successful dairyman who runs his business at a profit and can be considered a successful farmer in the dairy line, he is a safe example to follow for hundreds of other milk producers of New England too many of whom are farming without profit, and consequently without common sense, as if the latter is used profit though perhaps small, must result, and if it does not result it is not common sense to stay in the business. The thing to do is find out if we are making any headway, and if not why not, as many times it is our own fault when we lay it to something else. Knowing our own conditions, studying the system and business ways of any successful person in the same business, may help us stop our leaks, improve our methods and place our balance on the right side of the sheet, and this is the thing we should do if we would continue in the business. A. E. P.

Carpitis.

I have a horse that is lame in the left forward knee, caused by an enlargement of the joint on the front side. The horse has been lame for about two years, sometimes quite lame and then again not very much. He is in good condition and apparently good health. The trouble is supposed to have been caused by either bumping or bruising the knee. Can anything be done to relieve him? B. A. Z.

New York.

There is little hope of relief in such a confirmed case; but we should clip the hair from the joint, tie the horse so that he will be unable to bump the knee and then rub in an ounce of cerate of cantharides. Rub the blister in for 15 minutes. Wash it off in two days and then apply lard daily. Repeat the blister in three or four weeks, if the first one did some good. A. S. A.

Scours.

I have a yearling bull, weaned last Spring. I gave him a good chance last Summer and had been feeding him on cut up corn part of the time, and when that got hard I fed him on cob meal, bran and cottonseed meal. He gets poorer every day; has a swelling under his chin and his bowels are not very good. I have been letting him run on sod, but have put him on dry food now entirely. I had two die last year this same way on another farm. The yearlings that died last year had scours very badly. I had this bull vaccinated last Fall to prevent trouble. J. F. J.

Have the young bull tested with tuberculin as the symptoms suggest tuberculosis. It is more likely, however, that Johne's disease is present, and it too is incurable. The latter disease is spread by manure. To make sure it is present it would be necessary to have microscopic examination made of manure and pinchings or scrapings from the rectum of the affected animal. Arrange to have this done by the experts of the veterinary department of your State agricultural experiment station. Meanwhile keep the animal separate. It may be added that the swelling under the jaw is dropsical and a characteristic symptom of bloodlessness and debility (anemia). A. S. A.

The Powerful Smalley Cuts Silo-Filling Cost!

The day of the old slat-apron silo filler is gone. No wise farmer is going to use one when he can get a money-saving, grip-hook, force-feed SMALLEY, that does the work quicker, easier and at less cost. It handles silage, cow peas or alfalfa in a hurry. Cuts it fine and uniform. Packs silage tighter—gives more tonnage.

No Power Waste

One pulley and chain-drive on blower outfits replace power-wasting idlers.

1914 Carrier

A 5 H. P. Engine will run a No. 12 force-feed and our 1914 enclosed carrier. Special alfalfa grinding screen furnished extra, protected by screen patent No. 721,246. Make your own meal.

THE EGG-LAYING CONTEST.

THERE is quite a decided drop in egg production during the thirty-first week, the number laid being 3,440—12 dozen less than the previous week. White Leghorns are responsible for most of this loss, their output for the week being 111 eggs less than the week before. But the Leghorns make all the high scores again this week. A. B. Hall of Connecticut, taking first place with a score of 60. Four pens of Leghorns tie for second place with scores of 57 each. They are the Glenview Poultry Farm's pen, Chas. N. St. John's pen, Mrs. K. E. Woodruff's pen and P. G. Platt. Three pens of Leghorns tie for third place. They are Thomas W. Moore's pen, Chas. Heigl's pen, and Geo. A. Cosgrove's pen, each pen scoring 56. Three pens of White Leghorns also tie for fourth place with scores of 55 each. They are N. W. Hendryx's pen, Branford Farm's pen, and the "sour milk" pen from Storrs Agr. Station.

Of all the American breeds only one pen scored 50, or over; and that was Neale Bros. White Wyandottes which scored 52. The week's record is given below:

THE dull routine of the day in the bank was one day lightened by the receipt of the following communication: "Dear Bank: What interust would you give on a Depossit of 15 dollers? What interust per annium and allso (confidenshial) could my Husband draw it out without my signachure an is it the Law that I would have to have his Permission to Deposit it thare in your Bank. Please to ancer back an be sure to say what interust per annium an if he can draw it out. Yours with respeck."—New York Evening Post.

An "Innocent Purchaser" of Wyandottes.

BEING one of the "innocent purchasers," I think I have a right to enter this Wyandotte discussion. I hold no brief for Tom Barron, simply speak on behalf of fair play. Charges that cannot be proved will surely prove a boomerang.

Why is this rumpus anyhow? We're badly beaten, that's what! We feel bad over it, as we should; but that's no excuse for recriminations. More and worse, we are hoist by our own petard, (with a "furriner" doing the hoisting) for the White Wyandotte is of American origin. We are also again taught a needed lesson in thoroughness by the people of the older countries, and that stings also.

'Tis said the Barron Leghorns show Minorca also. What of it all anyhow? Who's posing either breed as show birds? Isn't it easily possible that Barron in choosing his breeding stock solely by trapnest egg records, chose thereby those having the particular types complained of, and by breeding from such, accentuated them? Wouldn't it be possible to take what are called the "sports" of any made breed, and by using them revert to a bird something like the original parents of the breed? Who is to say what was done in the way of crossing the stock before Barron got them originally? It seems to be a common practice. This fancy shape and feather folderol is about played the limit; we cannot "shape" or sell "feather," except to goops who hope to win, to sell to other goops who hope, etc. Fancy points haven't the slightest intrinsic value; people keep hens for eggs and meat at least 360 days in the year. Witness how few keep peacocks! But if a certain breed of fowls will lay double the ordinary output, that trait has value. Why did I import Barron White Wyandottes? To get a fowl laying heavily, furnishing a fair carcass for dressing to private trade at all stages, and, not least, able to reproduce in strong chicks.

If any American breeder could beat or even equal the record of the Barron White Wyandottes, with any breed, it would be shouted from Sandy Hook to Golden Gate, for anyone knows the value of his stock would be at least tripled, and the demand for them treble tripled. Yea, for the sake of the national honor, let such a one put them where the fact will be officially proven. Besides, a fortune awaits his taking.

Barron's Wyandottes will almost certainly have the greatest profits to their credit, even if beaten as to numbers. My first Barron White Wyandotte chicks, five weeks old, and the younger ones, are very uniform, and exceedingly lively. They resemble their parents as much as chickens possibly could. Every one is rose combed, which I don't recollect ever seeing in even one hatch of American-bred ones. Let those who know declare if these things would be true of the chickens from cross-bred stock. Not if I understand the Mendelian law!

But cheer up, fellers, we take the next trick; the 'boat races are coming and *they cannot lift that bloomin' mug!*

Orange Co., N. Y. LEO A. MAPES.

Shrink in Laying.

I have 11 pullets that began laying in January. They have laid well up to the present, although the yield has dropped off a little in the last two weeks. For some time the droppings have been very soft and in a few cases quite watery. I am feeding about two pounds of scratch feed a day with dry mash in a hopper; grit, shell and charcoal always handy. I feed some green stuff each day. Is the condition described natural, or should food be altered? W. M. B.

Massachusetts.

Most hens have passed the flush of laying and have begun to shrink a little in egg production so it is not strange that yours have done so. The soft droppings may indicate a little excess of green food or of meat in their rations, and unless so marked and persistent as to be evidently due to some inflammatory condition of the digestive tract, it need not cause you concern; should the droppings become green and bloody, however, it would be necessary to take son e remedial action. M. B. D.

Feeding Formula.

I have a flock of 40 hens and about 100 chicks. I feed them a dry mash consisting of 15 pounds wheat middlings; 15 pounds ground oats; 10 pounds gluten; 15 pounds cornmeal; 15 pounds Alfalfa meal; 10 pounds beef scrap. Do you consider this a good formula? If I can add or subtract something from this formula for their benefit I wish to. R. S.

Ohio.

This is a first-rate formula for a mash, though it might be made a little more bulky by the addition of as much wheat bran as there is middlings, and increasing the meat scrap sufficiently to keep the proportion of one-eighth part of the whole. With corn, oats, wheat and perhaps buckwheat as a whole grain ration in addition to the dry mash your little flock should give you good returns and make it well worth your while to give them the attention they need. I take it for granted that they have plenty of fresh water at all times as well as crushed oyster shells and grit. M. B. D.

PUBLISHER'S DESK

The attitude of THE R. N.-Y. towards fake ads. is only one of its commendable features. But that alone gives it a place in the very front rank of agricultural papers. By so doing it doubtless safeguards the pocketbooks of thousands who might otherwise be easily caught in the scheming nets of hosts of unprincipled rascals. For usually the most successful of those nets are set in newspapers. Most often it is the seductive advertisements in so-called respectable journals that enable these facile jugglers of other people's money to succeed in getting their hands in the pockets of the unwary. In many cases the most transparent devices for separating people from their cold cash would utterly fail if it was not for the apparent sanction given them by publications. Is there no newspaper standard of ethics? How long will the people support papers that underpin honesty? The fly is the carrier of disease and the cry is "Swat the fly." The mosquito spreads the deadly germ of yellow fever, and we are told to kill or screen him out. And when the newspaper becomes the medium of fraud, the chronicle of dishonesty, the vehicle of deception, the condemnation of the public conscience should fall upon it with frost-killing power. E. P.

Massachusetts.

This correspondent has found the responsible source of deceptive advertising—the publisher. We have pointed this out in print and in speech in public and in private, and no one has ever attempted to deny it, or to excuse the publisher who conspires with crooks to swindle his own customers and friends. I preached this gospel 25 years ago, when no one cared to listen. Everyone listens now, and responsible advertisers are coming to see that they cannot afford to associate with charlatans in the same paper. But the key to the whole situation is in the hands of the people. Refuse to let a paper into your home with an indecent or dishonest advertisement, and you will find the publisher will soon come to your way of thinking. If he does not he will have an early successor who will.

I do not know why I should be specially singled out by foreign lottery people, as I seem to get a copy of literature about once a month from the other side opening up to me an almost certain method of getting hold of any amount of wealth by simply sending from $1 to $5, as the case may be. I am enclosing herewith the latest chance in this line, which you will notice hails from Geneva, Switzerland. If you wish to do so you may give it a passing notice in your column of frauds and swindles. J. B. B.

Michigan.

People receiving these propositions through the mail should carefully preserve the envelope in which the literature is mailed and send it all to the Post Master General, Washington, D. C. This is the simplest way to dispose of it, as the matter is not legally mailable in the United States.

I wish you to help me out on one of the Good Housekeeping Building certificates. In June, 1913, they offered me $13 for it, but since that time they have discontinued to send me the magazine and now they write me they have nothing to do with the certificate, but to show good will offer me five years' subscription for the certificate. I will be satisfied with whatever you think is due on the certificate. If you are unable to adjust it, send the certificate and letters back to me. J. D.

Massachusetts.

This certificate was issued in May, 1908, by Herbert Myrick of Springfield, Mass., through the Phelps Publishing Company. In September of that year Mr. Myrick wrote J. D. telling him that he was then a co-owner in the magnificent building. This statement was untrue. Good Housekeeping Company did not own a single brick in the building referred to or an inch of the ground on which it stood. It never owned any ground or any building. Later on Mr. Myrick sold the magazine, and we understood the Good Housekeeping Company has no assets unless it be some contract or proceeds from the new owners of the magazine. It apparently has no business. It never was anything but a cloak to cover Herbert Myrick's schemes in connection with it and the magazine. As we figured it up there was due on the certificate $18.81. We made a demand on Mr. Myrick for this amount, and it has now been paid. The experience emphasizes again the danger of putting money into schemes promoted by publishers. This certificate was nothing but an acknowledgment for the remittance. As long as a promoter has other schemes to promote settlements may be effected; otherwise the chance of recovery is a matter of speculation with a high probable percentage of loss.

A full blood Guernsey cow—coming seven years; this cow is full blood, but not registered, good, size, splendid udder and teats, easy milker. Fresh last May and bred in July to "Langwater Puritan", the world's record Guernsey bull who is half brother to "Dotty Dimple", the world's record Guernsey cow, with a record under four years of age, of nearly 19000 pounds of milk, or to be exact, 18458.8 pounds milk; 906.89 pounds of butterfat at 3½ years of age. This cow will milk 55 pounds per day when fresh. Notwithstanding the extreme drought and dried up pastures she is milking 36 pounds per day now. She is very persistent milker. Has milked since May 15th; May, 700 pounds; June 1300 pounds; July 1175 pounds; August, 1090 pounds; or 4240 pounds in 3½ months. She will milk from 10000 pounds to 12000 pounds per year with an average fat test of 5.4%. Were this cow registered, I could get from $400 to $500 for her, carrying a calf as she does, of such breeding. If the calf was eligible to registry, it would be worth a great deal. I would like to buy this calf back from you whether it is a bull or a heifer, in case you buy the cow, and will give you $30 for the calf if a heifer, or $20 for it if a bull, to be shipped when two or three weeks old. Price for this cow, crated, f. o. b. $100, or I will sell you this cow for $75 crated f. o. b. but reserve the calf; calf to be shipped back to me by express at my expense when three weeks old. This cow will fill your requirements I am sure. I don't care about selling her, as I think a great deal of her and propose giving her an official test at next freshening. Of the two cows this one is the cheapest by $25. I will take her back off your hands after she freshens next Spring, and if she does not fill your expectations and my recommendations at $100, providing that she must be tuberculin tested before being shipped back. New York does not allow any animal over six months to enter State without an official tuberculin test. Next week is our State Fair week but have a crate on hand and can make prompt shipment.

Memphis, N. Y. G. S. BAGGETT.

The above is description of a cow made by the above named party at the time of the sale of her to Mr. J. R. Trotter of Morgantown, West Virginia. The following April the purchaser, Mr. Trotter, writes to THE R. N.-Y. as follows:

The cow arrived on the 28th of October. She never gave more than 12 pounds in a day and a test made by the Agricultural College of the University about the third day of November showed only 3.5% butterfat. The cow was fresh on March 15th and another test about the first of April showed 2.2% fat in the evening milk and 3% in the morning milk. I then asked Mr. Baggett for shipping directions to return the cow as per agreement.

In the meantime we have had a very unsatisfactory correspondence with Mr. Baggett over the transaction; he was always slow in making reply to our letters and sometimes we were obliged to write him three or four times before he would make reply at all. He finally consented to accept the return of the cow, and Mr. Trotter reshipped her by express. At first Mr. Baggett refused to accept the cow from the express company, because of delay in getting the certificate of the tuberculin test from the State Department. Mr. Baggett finally offered to refund $60 of the purchase price and let Mr. Trotter keep the calf, while it will be noted that in his letter describing the cow to the purchaser he only valued the calf at $20 to $30 at most. For obvious reasons, however, we finally consented to accept the $60, but we have been unable to get the remittance even for this amount. As the case now stands, Mr. Baggett has the cow and Mr. Trotter's $100; besides the purchaser went to the expense of $46.80 for freight charges, etc., to say nothing of the care and feed of the cow, which utterly failed to live up to the representations made for her. Mr. Baggett does not seem to be a member of any breeders' association, or we would be able to ask for an investigation of his methods. We, however, are not through with the case yet. We have placed the matter in the hands of our attorney, and if there is any way to compel Mr. Baggett to live up to his agreements, we propose to compel him to do so. He never advertised in THE R. N.-Y. and never could. Our only interest is particularly to protect this subscriber, and generally to protect the cattle industry. J. J. D.

BUFFALO MARKETS.

Unless there are still frosts there will be a big strawberry crop in the North. The Florida berries are now gone and they are coming from Tennessee. The supply will no doubt increase as soon as they come from Southern Ohio. There has as yet been no low-priced day in the strawberry trade, as is commonly the case. Consumers pay 15 to 28 cents a quart for good fruit, which is considered high. Egg prices have ranged from 13 to 18 cents at wholesale and not going above 23 cents to the consumer. There has been a limited supply of duck eggs offered, their semi-transparent appearance recommending them. They sell at a fourth to a third higher than other eggs. Live turkeys are down to 16 cents and dressed to 23, with fowls 17 to 18 cents on account of much demand for laying hens by non-raising fanciers. Few broilers bring 32 to 35 cents wholesale. Butter and cheese are firm, but there has been no late change in quotations. Best creamery print butter is from 29 cents down wholesale, fair to good crock, 20 to 21 cents. Cheese commands 18 cents for best domestic old and 13 to 14 for new. The consumer gets little that is really good for less than 20 cents. Apples are no longer plenty, but are going out of season and do not command more than $4.50 a barrel for fancy reds. There are still some fine-appearing western apples going at moderate prices, retailing at 15 cents a small measure. Lemon and oranges are a fourth higher than in early Spring. Oranges $2.50 to $3.75 per box; lemons $3 to $6 a box and grapefruit $2 to $3.75. Potatoes will be late, as often they were not planted till June. State grown do not go up, being 85 cents wholesale. There is a good supply of new Bermudas and some Floridas, at $5.25 per barrel, retailing at $2 a bushel. Cabbage is still high, but is in better quality, at $1.25 per arrel. Texas onions are $2.40 per crate; asparagus $1.75 per basket; string beans $1 to $1.75; per hamper; cucumbers 40 cents to $1.25 per dozen; rhubarb 15 cents per dozen bunches; spinach $1.25 per barrel; yellow turnips $2 per barrel; tomatoes $2.25 per carrier. Hay is weak and has declined lately, on account of flush pastures and the prospect of a big crop, best Timothy $15 per ton; No. 2 $13; No. 3 $10. Rye straw $9 a ton; wheat and oat straw $8. All sorts of millfeed are going down, wheat bran being $23.50, having been $25 a month ago. J. W. C.

May 30. The month of May has been unprecedented for the many days that land could not be worked, on account of the many showers and lack of sunshine. The ground has fitted very hard by being packed by the heavy rains. Oats were sown very late and some are not in yet. Corn just planted this week, which is unusual for this section. Late potatoes will follow as fast as work will allow. The prospects for apples are good, being a very good bloom. Bartlett pears are scarce. Sweet cherries are light; sour cherries bloomed heavily. Plums are good while peaches are an entire failure. Spraying is being very thoroughly done this season; some have sprayed three times already. Wheat and Alfalfa are making a very rank growth. Alfalfa will soon do to cut. Wheat $1; oats 40; corn 70; barley 70; potatoes 75 to 80. Wool has advanced since farmers have sold it.

Canandaigua, N. Y. E. T. B.

June 1. Weather dry and hot, no rain for more than three weeks. Pastures drying up; meadows and oat crop ruining for rain. Wheat a fair crop, but would have been better with rain. Prospects good for apples and peaches; cherries and strawberries ripe. Farmers are getting good prices for most products. Good milch cows $50 to $90; beef cattle six to eight cents; hogs eight to 10; horses $100 to $200. Corn $1.05; wheat $1; oats 70; potatoes $1; hay $15. Hens 12; chickens 20; eggs 15; butter 15. Growing corn crop is being kept clean of weeds, some being worked the second time. W. H.

Washburn, Tenn.

Everjet Elastic Paint

A low-priced, outdoor paint

Use Everjet for farm machinery to prevent rust, especially if the machinery is to stand outdoors through the winter.

Use it for all kinds of ready roofings, galvanized iron and tin, pipes, stacks, tanks, boilers, windmills and fences.

Booklet free on request.

Products, Prices and Trade.

Wholesale Prices at New York,

Week Ending June 12, 1914.

MILK.

The Borden milk schedule to producers for the six months beginning with April is as follows, compared with last year. This is per 100 pounds in the 26-cent zone. For the 29 and 32-cent zones the schedule is 10 cents less for all months:

	1914	1913
April	$1.40	$1.50
May	1.15	1.25
June	1.10	1.10
July	1.25	1.35
August	1.40	1.45
September	1.50	1.55

Figuring 86 pounds to the 40-quart can the per quart price is as follows; April, 3.01 cents; May, 2.47; June, 2.36; July, 2.68; August, 3.01; September, 3.22.

Wholesale prices paid by New York dealers are running $1.51 and $1.41 for B and C. Hotels and restaurants using two to three cans per day are paying 4¾ to five cents per quart. The supply for New York trade is increasing, but the demand is good and no special price reductions noted.

BUTTER.

The week has shown a decline and advance and is closing one-half cent under last week's figures, with a fairly firm market. Considerable extra creamery was moved at 26½. Medium and lower grades are accumulating, lower figures evidently being needed to move them.

Creamery, extra, lb	26½	@	27
Good to Choice	23	@	25½
Lower Grades	20	@	22
State Dairy, best	25	@	25½
Common to Good	18	@	23
Factory	16	@	19
Packing Stock	15	@	17½

Elgin, Ill., butter market 25¾ cents.
Philadelphia, western creamery, 27 cents.

CHEESE.

There is a one-cent advance on the better grades of whole milk, and some desirable small sizes sell up to 15¾. The advance has checked trade to some extent but not enough to warrant cutting price on anything desirable.

Whole Milk, new, best	15	@	15½
Common to good	11	@	13
Skims	5	@	10

EGGS.

The market is in decidedly unsettled condition owing to the large proportion of heat-damaged and tested-out stock. The usual hot weather tales of chicks hatched on the way are going the rounds. The candler hears a faint "peep" down in the egg crate, and fishes out a young Legnorn or P. Rock, as the case may be. The writer found one instance of this sort that appeared to be authentic. Nearby fancy eggs are one to two cents higher. In the early part of the flush season, before hot weather begins, buyers who want a good grade are able to get satisfactory supplies from the western gathered stock, but now they run more or less off in quality, so that particular buyers are obliged to take the nearby eggs, and pay the consequent advance.

Western fresh, white	20	@	21
Lower grades	15	@	18

FRESH FRUITS.

The range of available fruits is widening, so that apples are the least desirable of market offerings. Western oranges have been better than last year and fairly reasonable in price, $2.50 to $4 per box. Strawberries continue very plentiful and are low, except for extra choice, free from sand and white ends. Gandy is always at the top when in good condition, and some Chesapeake, from Maryland, have shown up extremely well, selling at a premium. Receipts of cherries were heavy the latter part of the week, a good many going at disappointing prices because of irregular quality. The bell-shaped peach basket, so largely used is one of the poorest packages for cherries that are anywhere near ripe, as the weight on top is sure to crush those near the bottom. Eight-pound grape baskets are much better for this crop.

VEGETABLES.

Old potatoes, reasonably sound, are selling 25 cents higher than last week, but at interior markets they are lower, some Maine growers having sold at $1 per barrel to clear out their holdings. The market on new stock is weak, except for the best. Green peas in large supply and low. In commercial culture it is hard to get peas picked right. Of course there should be no empty pods, but over-ripe, whitish pods look worse and are sure to discount the price of the package. The bushel basket, either flat or bell-shaped is a much better package for peas in the pod than the burlap sack commonly used, as the pods get more or less bruised in the sacks and are likely to heat if piled together.

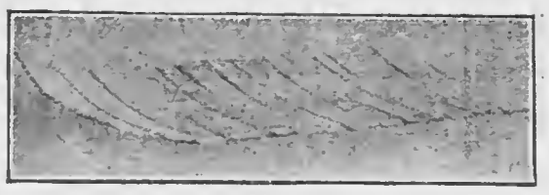
Chickens, roasting, lb.	30	@	32
Fowls	25	@	28

*

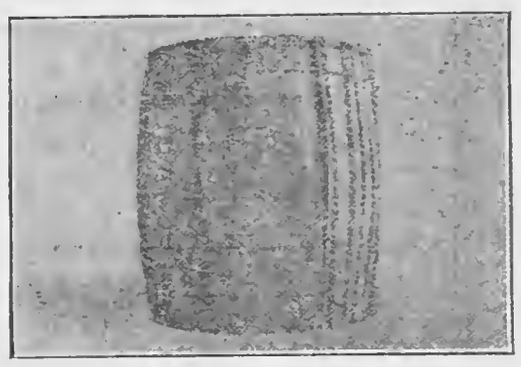
The price of new wool in both the Central States and the West has been on an unexpectedly high basis. From some points of view it seems unduly high as compared with foreign wools of similar grades. During the past month fine wool in Ohio has sold at 26 cents, and medium clips up to 27. In Montana choice wool has brought 21 cents, and 19 to 20 is reported from Texas. There are plenty of lower price prophecies in the near future, but some large holders show no disposition to sell at the present figures, stating that they expect another cent or two advance. W. W. H.

Collapsible Barrel.

THE price of apple barrels has increased so much that comparatively few are thrown away now. They are picked up here and there, and after going through package hospitals, are shipped back to the country for further use. The chief objection to this is the high freight on a package so bulky as an empty barrel. The pictures show a barrel called the Ideal, which can be taken apart and put together quickly, and shipped in knockdown form. Fig. 339 shows a barrel in the flat, wires stapled to the staves holding them in place.



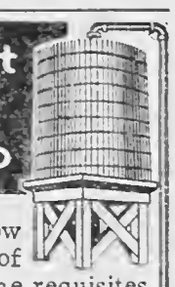
A Barrel In The Flat. Fig. 339.



Ten Barrels Ready For Shipment. Fig 340.

Fig. 340 shows 10 of these flats rolled up for shipment, occupying about the same space as an empty barrel. The heads and hoops go in a separate package. The end hoops are adjustable and readily tightened with a key or wrench.

Water Without Pumping Plenty of It Too

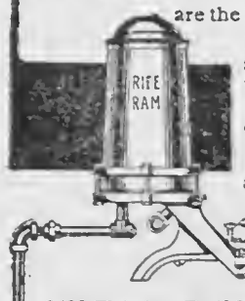


ABSOLUTE reliability, low first cost, and no need of attention and repairs are the requisites of a perfect water system. Engines are often a source of annoyance, windmills depend entirely upon the wind, and hand pumping is enough to drive anyone off the farm. Be absolutely free from all water supply troubles—install a

RIFE RAM

Any stream in your neighborhood having a fall of three feet or more and a supply of three gallons or more per minute, will operate it. The Rife Rams vary in size from a machine for one family's use to a city water system. Thus you can co-operate with your neighbor if there is no stream on your farm.

REMEMBER:—Low First Cost—No Repairs for Years—No Freezing—No Fuel—No Labor are the high qualities of the Rife Ram.



No skilled labor required to install it. Over 11,000 in daily use. Satisfaction guaranteed. Write today for catalog and

BOY WANTS PERMANENT PLACE ON FARM where he can learn farming; wages no object to start. CHAS. HOELSCHER, 707 Amsterdam Ave., New York.

POSITION WANTED by middle-aged married man, no family, as gardener and caretaker on private place. COMPETENT, care R. N.-Y., 333 West 30th St., N. Y.

WANTED BY JULY 1st or 15th, by sober, steady young man, work on New York fruit farm; wife, one child. E. V. MATTHEWS, Rockville, No. 3, Box 37, Montgomery Co., Md.

YOUNG MAN, single, native New York State, life experience general farming, desires position; farm or poultry work; state wages; give full information. RAYMOND C. WHEELER, Cuba, N. Y. R. D. No. 5.

WANTED SINGLE MAN for general farm work; must be sober and honest; good milker; owner absent all the time; wages $25, board and washing; send reference first letter. PETER MARGOLIN, 569 Broadway, New York.

FARMER WITH LONG EXPERIENCE and efficient manager, open for position to take charge of farm; expert agriculturist, dairyman and fruit grower; men, machinery and tools; American with small family. E. HOWE, Southbridge, Mass.

ALFALFA HAY. F. P. ERKENBECK, Fayetteville, N. Y.

HORSES THOROUGHLY AND CAREFULLY broken to saddle for the road or field; distance no object. L. HOWARTH, Mt. Freedom, N. J.

WANTED—Winter Vetch; mammoth, medium and alsike clover; also barley; state quantity, price, and enclose sample. W. A. HENRY & SON, Wallingford, Conn.

VERMONT MAPLE SYRUP @ $1.10 PER GAL. Choice fresh eggs in 30-dozen cases @ 26 cents per dozen. Potatoes in any quantity. JAY T. SMITH, Rupert, Vt.

EARLY RICHMOND CHERRIES—June 25th to July 5th; Morency's, July 5th to 10th; 6 cents pound in baskets; delivered express office. Canned on the farm in 2-pound enameled sanitary cans; syruped, with pits; $1.25 per dozen. SENECA FRUIT FARM, Waterloo, N. Y.

MAPLE SYRUP FOR SALE FROM THE MAPLE Grove; taking a first prize at the Centennial Exposition; guaranteed under the provisions of the Pure Food and Drug Act; in gallon cans, $1.25 for a gallon f.o.b Norwich, B. & M. R. R. Price of 50 gallons on application. GOVE HILL FARM, Donald MacKay, Supt., Thetford Center, Vt.

FOR SALE—Part of my farm, including buildings or whole farm, 36 acres; stock and tools. CHAS. CHRISTENSEN, Shelton, Conn.

IDEAL DUCK AND POULTRY FARM FOR SALE—19½ acres; close to town and railroad; good buildings; total equipment included for $2,800. LEO WILLIS, Cordova, Md.

FINE VILLAGE AND RIVER FARM FOR SALE—Fine house, water, fruit; good barn; keep 25 cows; 1½ miles to depot. BOX 24, Rockland, N. Y.

SMALL FARM FOR SALE—New bungalow, six rooms and bath; one-sixth acre land; part of large fruit farm; 1½ miles from village on trolley. BOX 154, Highland-on-Hudson, Ulster County, N. Y.

FRUIT, TRUCK, POULTRY FARM FOR SALE—36 acres, excellent location and market; good buildings; all kinds fruit; strong soil; with or without stock, etc.; buy direct, saving commission. HOMER TWEED, Quakertown, Pa.

FOR SALE—Fruit and poultry farm; 32 acres; excellent land; good water; cherries, plums, pears and apples for market; fully equipped poultry plant; 10 minutes walk to station; telephone and R. D. GEO. WHITENACK, Skillman, N. J.

FRUIT FARMING OPPORTUNITY—A gentleman wishing to take up fruit farming either as an investment on shares, or to purchase outright, farm near New York, should investigate by writing: FINE FRUITS, care R. N.-Y., 333 West 30th St., New York.

FOR SALE—Farm, 55 acres; nice, light land; 1,000 fruit trees; apple, peach, pear, cherry; new seven-room house; fine poultry and truck farm; large hen-house; good stables; close to school and town; will sell on easy terms if sold quick. CALEB BOGGS & SON, Cheswold, Del.

FOR SALE—330 acres; one-half rich bottom, the remainder half sandy with clay subsoil and other lime; good water, everlasting; 30 miles south of Montgomery, Ala.; half mile from L. & N. R.R.; in high state of cultivation; produced 90 bushels corn per acre; 50 bushels of oats; 1½ bales cotton; 3 to 4 tons cured hay; plenty labor; good stock farm; perfectly healthy. Owner, J. E. BISHOP, Ft. Deposit, Ala.

FOR SALE—The highly developed stock farm, Idle Hour Place, formerly owned by T. H. Russell; 275 acres, near Geneva, Ohio; impressive modern buildings; mansion house completely furnished; combination gentleman's estate and farm; up-to-date equipment; devoted for years to the breeding of Holstein-Friesian cattle. The property stands me over $75,000, but for business reasons must be sold and will take a loss. C. J. SCHEFFREEN, Owner, 1010 Old South Bldg., Boston, Mass.

The FARMERS' BUREAU an agency exclusively for agricultural help. Only first class farm help and positions solicited. References investigated. Scientific advice on farm problems. Dept. R, 150 Nassau St., N. Y. Phone, 5565 Beekman

HUMOROUS

"Who can describe a caterpillar?" asked the teacher. "I can, teacher," shouted Tommy. "Well, Tommy, wha[t] is it?" "An upholstered worm."—Cred[it] Lost.

First Tramp: "After all, it pay[s] be perlite, pardner." Second T[ramp]: "Not always. The other day I wa[s] deaf and dumb when a man g[ave] sixpence. I says, 'Thank you, si[r]' he had me arrested!"—Credit Lost.

"Paw, what is an efficiency expert?" "An efficiency expert, my dear boy, is a man who is possessed of the idea that he can teach a hen a better way of laying an egg than the way she has been doing it for ages."—Credit Lost.

"Sam, I understand there's a schism in your church," said the jocular man to his colored man-of-all-work. "Kaint be, 'less'n somebody done made us a present of it, 'cause we done spent all ouah money foh a new ohgan."—Livingston Lance.

"Do you try to make home life pleasant for your son?" "Yes," replied Farmer Corntossel. "But it's mighty hard to live up to the refined ways he insists on. I'm annoyin' him terrible because when I'm workin' around the barn I keep forgettin' to refer to the hayloft as the mezzanine floor."—Washington Star.

Little Jimmy had spent his first day at school. "What did you learn?" he was asked on his return home. "Didn't learn anything." "Well what did you do?" "Didn't do anything." "Well, what happened?" "Oh, a woman wanted to know how to spell 'cat,' and I told her."—Detroit Free Press.

"The train struck the man, did it not?" asked the lawyer of the engineer at the trial. "It did, sir," said the engineer. "Was the man on the track, sir?" thundered the lawyer. "On the track?" asked the engineer. "Of course he was. No engineer worthy of his job would run his train into the woods after a man."—Chicago Record.

"Oh, thank you," said a lady to a laborer, who gave her his seat in a crowded car, "thank you very much." "That's all right, mum," was the cheerful rejoinder. As the lady seated herself he added, "Some men niver get up unless a woman's young, an' pretty, but you see, mum, it makes no difference to me."—Melbourne Australasian.

Two Washington youngsters were visiting their father's country place in Virginia. One of them observed: "Marie, I don't see how cows can eat grass. Do you?" Marie considered, and then replied: "I suppose it's like this: When the cows are young, the mother cow keeps saying to her children, 'If you don't eat grass you shan't have any pie.'"—Woman's Journal.

"Yes, sir," said Philip, "I've come to the conclusion that I amount to something after all. There have been times when I was disposed to believe that I was a mere cipher in the world, but I can never have so small an opinion of myself again." "What has caused this sudden change in your estimation of yourself?" "I have just been talking to a man who wants my vote."—Evening Post.

A clergyman was arguing with a friend of his on the desirability of attending church. At last he put the question squarely: "What is your personal reason for not attending?" The gentleman smiled in a quiet way as he replied: "The fact is, one finds so many hypocrites there." Returning the smile, the clergyman said: "Do not let that keep you away; there is always room for one more."—Melbourne Australasian.

Why Men Quit
Some Other Tires—Five Reasons

The evidence is that—faster than ever—men are quitting other tires for Goodyears. So far this year our tire sales exceed last year by 55 per cent. Yet last vear Goodyear far outsold any other tire.

There are big reasons for this, and every tire user should know them.

What Others Lack

Other tires—all of them—lack these four features. And these are the four major factors in tire mileage.

Our No-Rim-Cut feature, which completely ends rim-cutting. No other satisfactory method is known.

Our "On-Air" cure, which saves the blowouts due to wrinkled fabric. This one extra process adds to our tire cost $450,000 yearly.

Our rubber rivets, of which we form hundreds in every tire—during vulcanization—to combat loose treads.

Our All-Weather tread—tough, double-thick and enduring. As smooth as a plain tread, yet grasping wet roads with sharp, resistless grips.

Thus your four greatest tire troubles are met in these tires, in costly ways employed by no other maker.

Then Extra Price

Then 16 other makes this year cost more than Goodyear prices. Four Goodyear tires cost about the same as some makers ask for three.

That fact is due to our mammoth output, our splendid efficiency and our modest profit. Our profit last year averaged 6½ per cent.

Men are refusing to pay those extra prices for tires which lack the four great Goodyear features.

Remember that men have made mileage tests on millions of Goodyear tires. And this flood-like demand follows all those tests. Such evidence of quality is beyond dispute.

Any dealer will supply these tires, at Goodyear prices, if he knows you want them.

CRAINE SILO

IT CAN'T COLLAPSE

The Craine Patent Triple Wall Silo has thick vertical wooden staves, inside; horizontal patent wooden covering thoroughly nailed, outside; and water-proof felt-like rubber roofing between. This makes a perfect non-conductor of heat. SCIENTIFIC in every feature of its construction.

IT'S FROST-PROOF
AIR-TIGHT PERMANENT

No silage spoiled by contact with concrete, tile or any mineral. Craine silage is sweet, clean and perfectly preserved—it is "drawn from the wood." No troublesome iron hoops requiring annual overhauling. The first cost is low and is the last. The Craine is, therefore, the cheapest on the market. Ask for illustrated booklet.

VOL. LXXIII, No. 4261. NEW YORK, JUNE 27, 1914. WEEKLY $1.00 PER YEAR.

WHERE BOYS MAKE GOOD.

A School That Manufactures Manhood.

PART I.

THE BOYS AND THEIR HOME.—It so happened that my visit to the Lincoln Agricultural School, at Lincolndale, New York, which is an adjunct of the Catholic Protectory of New York, under the management of Brother Barnabas, was on the anniversary of the founder of the order of teachers to which Brother Barnabas belongs, and the boys were having a holiday on that account. I identified the school by a 10-acre lot full of boys playing ball. It is one of the best fields on the 600-acre farm, and Brother Barnabas pointed to it after the first salutation, and said, "That is my best crop." My first observation was that there was nothing institutional about the place or the boys. There were no fences, no guards, no uniforms. The boys were dressed after the fashion of their individual tastes, and the only thing that distinguished them from 250 other boys of same age that one would meet in a play field was their uniform alertness, cleanliness and courtesy.

THE BUILDINGS.—There is one main building with two dormitory wings, six cottages; three cow barns and one horse barn. I first went through the clean, well-lighted class-rooms, with individual seats and ample blackboard space. There are several of these where the boys are taught to read, write, spell, and make a living. The instruction is limited to these subjects and Christian Doctrine. Elementary grammar is taught in connection with letter-writing and simple composition.

THE KITCHEN.—As it approached lunch time we went through the kitchen, which was in charge of a chef in white duck. I have been through numerous high-class hotel kitchens, and I am frank to say I never found one that compared with the Lincoln School kitchen in point of order and cleanliness. Brother Barnabas explained that he had had the greatest trouble to find a satisfactory chef. Protest as he would, the cooks would grow careless with boys' food after they had been in the house a fortnight. They would willingly fix up dishes for himself, but insisted that anything was good enough for boys. So the first year there were many changes, and finally the man was found who could respect the rights of a boy.

THE COMMISSARY DEPARTMENT.—I was greatly interested in what at the school is called the commissary department, which includes the kitchen and dining-room work. Boys as a rule do not take kindly to this kind of work, but at Lincolndale service in this important department is assigned as a mark of merit. Only boys of good standing are assigned to it; and all understand the dignity of the position because of the privilege of serving others. It is the Lincoln spirit.

THE DINING-ROOMS.—The dining-rooms in charge of these boys were a delight. There is no general mess hall with long tables with oilcloth covers and backless chairs, as are found usually in such places. The rooms seat about 30 boys. They are light and well aired and steam heated. Small round tables, covered with clean white cloths, seat

THE LINCOLNDALE SCHOOL. BROTHER BARNABAS AND A GROUP OF HIS BOYS. FIG. 340.

four boys on regular dining-room chairs. Every table held a bouquet of wild-flowers. I inquired if this was by order of Brother Barnabas, and I was told no. The department is in charge of one of the high-merit boys, and at his own initiative he provided the flower decoration. They enjoyed the gathering of the flowers, he told me, quite as much as the cheerfulness of them in the room. I learned that there are no favorites and no special tables at Lincolndale. Every teacher, and every visitor, high or low, goes in with the boys, and eats just what the boys eat, nothing more and nothing less. I found myself escorted to one of the dining-rooms and seated courteously by one of the boys. The tasty milk soup was served in soup plates from the kitchen. The fish and vegetables were brought in in large dishes; and one of the boys, with all the plates before him, served the other boys and myself. We had fish, two vegetables, green onions and green radishes, wholesome wheat bread, coffee with milk and sugar, and plain cakes. No butter was served with this meal. We had napkins, silver and plate of the quality usually found in private families of culture and fair means. The boys at my table were probably 12 to 13 years of age. There was not a dull minute during the meal. The boys told me of the fire they had had, of the horses they drive, and their hopes of an auto in the future. They displayed intelligent, general information, and surprised me with their understanding of the Mexican situation and of the causes that led up to it. While frankly and promptly responding to any suggested lead, the boys did not show any anxiety to display their information. They showed reserve without timidity, and ready expression without boldness. I was so charmed with the conversation and deportment of the boys that I forgot my coffee and abandoned the cup half drank when the boys at other tables rose to depart.

THE COTTAGES.—After lunch the boys took me through their cottages. These are arranged to accommodate 30 boys each; but the two connected with the main buildings have two floors, equipped for 30 boys on each floor. Each floor has a large parlor with open fireplace, a large table covered with papers, and a closet of books. The room is provided with comfortable chairs and the walls are decorated with pictures. A corner of the veranda is screened in, and the boys furnish this with a table and chairs in favorable weather. In the sleeping-room each boy has an iron bed, clean and comfortable, and covered with a clean spread. He also has a chair and a chiffonier, in which he keeps his personal belongings, such as comb, brushes, collars, ties, etc. These were provided with locks, but the keys were not used. I marveled that 30 boys could sleep in one room with personal effects and trinkets exposed and find no need for locks. I was told that that was because of the Lincoln spirit. No boy would touch what belonged to another. Here were 30 boys living and sleeping in a cottage by themselves with no monitor, and not a scratch to mar wall or furniture after five years of service. I asked what stayed the hand of the careless or mischievous boy, and was again told, the Lincoln spirit. We went to the basement, where the boys practice indoor sports. The hard floor serves for roller skating, and each boy seems to have a pair of roller skates. The sides of the room are lined wth steel lockers, where the boys keep their skates, their farm clothes, and their baseball suits.

EVIDENCES OF CHARACTER.—During the afternoon the boys donned their uniforms and returned to the ball field determined to make the most of their holiday. I mingled with them. They had the baseball vocabulary and used it freely; but in all that field, with 10 or 12 games all going at one time, I did not hear a single dispute, and no protests against the umpires' decisions. I not only did not hear an oath, but I did not hear a vulgar or offensive expression of any kind. The girls of the female seminary might witness those games and mingle with the players without hearing anything objectionable to their sense of delicacy. To fully understand the significance of this, you must remember that these were boys from the New York streets. Some of them were destitute, with no one to look after them or care for them. Others were delinquents. When they went to the school they were probably no better nor worse than our own children or ourselves might have been under similar environment and like conditions. The future of a destitute or delinquent boy in New York City, if left to himself, is a mere matter of speculation, no matter who were his parents. On the street they learn slang, vulgar and profane speech. They are hunted from place to place, taught craft and deceit. The bold among them are constantly on the defensive; the timid develop a low cunning; and frankness and candor, to say the least, are not characteristic virtues. Disease and hunger and dissipation demand their share of such children when left to themselves. Of those who reach maturity in this environment, the dull would help swell the population of our almshouses, the bright among them would become criminals. There may be exceptions; there probably would be. This is the rule. As a resident of the city I am familiar with these conditions, and for that reason was able to apreciate the transformation of these boys at the Lincoln Agricultural School.

SYSTEM OF MANAGEMENT.—There was nothing to keep the boys from leaving the farm if they choose to do so. I asked my boy escort if they ever ran away. Only three I was told in all the experience of the school. Two came back the same day, and were promptly reinstalled. One tried to come back later, but was not allowed to do so. A place, however, was found for him. I asked my young escort how the new boys got on. "Oh, all right," I was told. "You see, the new boys are put in charge of a merit boy or a 35-boy. Brother Barnabas requests the monitor not to be too strict at first, but to lead the new boys gradually to see that the other boys would not stand for anything but good conduct. They are made to understand that no matter what the past has been, their standing at the school depends on what they do there. Every boy gets a show, and he is advanced in the merit roll as he deserves."

THE MERIT SYSTEM.—I was a little hazy about "35-boys" and "merit roll," and I asked for an explanation.

"Why, it is this way," explained my escort. "Every boy has some merit, so the new boys each get a seven mark. At the end of six months a new boy is permitted to write a letter to the council, asking to be advanced in merit, and giving the reasons why he thinks he should be advanced. If the council thinks he deserves it he is then given 14 points. After another six months, if he maintains his good record, he gets 21; then 28, and finally 35 points, which is the highest merit." If the boy then maintains his record for a year, on the following Lincoln's Birthday he gets a Lincoln diploma and becomes a member of the Lincoln Agricultural Society. Every boy is striving for this distinction. This was all plain enough. The "35-boys" were those who after some years of perseverance had attained the highest degree of merit. But their standing was defined by "the council."

"Does the 'council' mean the Brother teachers?"

"No, the 'council' is made up of the '35-boys.' Brother Barnabas would have the right to change the decision of the council, but he never has occasion to do so, because the boys are constantly in touch with one another, and know the records."

"When a boy is not advanced, does he often complain that he has not been justly treated?"

"No, because the 35-boys responsible for him tell him openly why he is not advanced. The other boys know the reason, too; so the boy knows he is justly rated. But he has a chance to redeem his record the next period." J. J. D.

THIS SOIL NEEDS LIME.

I OWN 50 acres of level bottom land along a river, on which I wish to raise hay crops year after year without rotation with any other crop. My present method of handling it is as follows: After the hay is cut I plow up about one-quarter of the tract each year, cultivate thoroughly, and harrow in about 1,000 pounds per acre of some commercial fertilizer, and seed it down with Timothy and Red-top, mixed. This will give a heavy crop, nearly all Timothy the next season. The second year, there will sometimes be a fair crop of Timothy and Red-top mixed, and sometimes there will be nothing but Red-top, the Timothy apparently having run out with one crop. The third year both Timothy and Red-top have nearly disappeared, and wild grasses and weeds have come in and the tract has a general run-out appearance. The soil is chiefly a black sandy loam of good depth. Is there any way of keeping up this land with commercial fertilizers so it will produce a good crop of good quality hay, for more than two years in succession, without reseeding? I do not have any manure, and cannot get it without buying city manure at $3 per ton. I have tried top-dressing with commercial fertilizer the third year, but could see no benefit from it. Are there any other grasses that will make good hay that would be more permanent than Timothy and Red-top? W. C.
Connecticut.

From your statement it seems to us that the trouble is a very sour soil. We should recommend the use of lime, at least one ton of burned and slaked lime to the acre when seeding down. The fact that the Timothy runs out so quickly, and that the wild grasses and weeds come in, indicates lack of lime as Red-top can stand a reasonably sour soil, while Timothy and clover are almost sure to be driven out of the land. On our own farm this trouble often occurs. We have frequently seeded Timothy and Red-top with a good dressing of fertilizer. The Timothy came in fairly well the first year, but soon died out; the Red-top survived perhaps a couple of years, and then disappeared. By the use of lime we have overcome this objection so that both Timothy and Red-top make a fair stand, and are able to use to advantage an application of fertilizer. We should not attempt seeding with other grasses. Timothy and Red-top are the most available grasses for your section, but you must feed the soil for them, and in your case lime will be necessary. Lime your soil properly and you can easily keep up its fertility for grass growing without the use of stable manure, but unless you use a fair amount of lime under your conditions, the grasses cannot make the proper use of the chemicals.

CLEANING OUT THE FLIES.

I AM anxious to eliminate, so far as possible, the flies from about the barns and house, and am looking for something with which to spray the manure piles and barns in order to kill the maggots. The spray material must be liquid and something that will not affect the fertilizer ingredients of the manure.
Middleport, N. Y. C. C. S.

A mixture of equal parts of acid phosphate and kainit is a good combination for the purpose. It is usually handled dry, scattered over the droppings in the stable, but it can be dissolved in water and used as a spray or put on with a sprinkling pot. These chemicals *repel* the flies, so that the eggs are not freely laid in the manure. The acid phosphate contains phosphoric acid, while the kainit carries potash, both of which go well with the manure as fertilizers. Yet the use of these chemicals will not entirely cure the fly pest, so long as manure piles are left where the flies can get at them. The *sure* plan for a house or hotel is to keep all the manure out of reach of the flies. This can be done by fitting up a shed or room with screened doors and windows so the flies cannot enter. The manure is wheeled into this room frequently and the doors kept shut. This keeps the flies away. While they may lay a few eggs in filth or other kinds of manure, there will not be enough to cause trouble if the manure is sprayed and then kept behind these screened doors. Any stable or manure pile nearby which is not thus protected will breed and supply a great stock of flies. The one thing to remember is that the eggs are laid and hatched in horse manure.

RYE IN A YOUNG ORCHARD.

WHEN I took possession of this place May 1, 1914, I found between apple trees, eight and 12 years old, Fall rye now (May 20) two feet high. I am told by some it would be bad to let it mature. It was put in for the hens (200). As the young trees are looking fine I do not want to set them back. Will the rye be too strong for them? The land is in good shape. I have 1,500 apple and 500 peach trees, and they have practiced the sod mulch system here. The question is what to do with the rye.
New Hampshire. C. C. P.

Our experience has been that one of the worst things you can do is to let a crop like rye go to full head in a young fruit orchard. The damage is much worse, of course, in a dry time than when there is an abundance of moisture, but in a dry season a crop of rye thus maturing will put the young trees back in their growth for at least two years. We have tried this several times, and never found it to fail. The rye is peculiar among grains in its ability to take the moisture out of the ground rapidly after it forms its head. We have now an instance of this ability which has worked out to our advantage. A crop of rye growing on a soggy and poorly drained field has taken the moisture out of the soil so rapidly that we were able to work it two weeks in advance of a field of the same type left bare through the Winter. We should either cut that rye after it forms the head, and rake and pile the material around the trees, or else plow the whole thing directly into the ground. Use a fair quantity of lime, pack the furrows down hard with a roller, and keep the upper surface thoroughly worked until it is fine and open. We should then plant corn between the young trees, or if some poultry food is desired we should plant a combination of buckwheat and clover, late in June, and turn the poultry in when the grain began to form. The rye will not amount to much as a poultry food. The hens are not fond of it, and will not usually eat the whole grain unless they are starved to it, while they will eat the buckwheat readily. If you have stock, and especially cows, the rye can be cut early and cured into hay. It does not make a high-class fodder, but the stock will eat part of it at least, and the remainder can be used for bedding, but at any rate do not let this rye go to maturity among those young trees. Cut it or plow it under as soon as you can. Either pile it around the trees, or cure it as a hay, but at any rate never let it grow beyond the head in a young orchard.

SCIENTIFIC PRODUCTION OF FINE APPLES.

From Plowing to Packing.

PART II.

THINNING.—Size of fruit is also decidedly affected by the amount of fruit borne. Even with the best of culture, pruning and spraying, apple trees frequently set more fruits than they can properly mature. This also is partly responsible for off years in cropping. These difficulties can be greatly reduced by proper thinning of fruit. The production of large numbers of seeds overtaxes the tree and detracts from its ability to produce size. In no case should fruits be allowed to stand closer than four to six inches. The proper time for thinning is during June, or after the usual "June drop." Frequently the removal of dwarfed, gnarled and insect-bitten fruit is sufficient, and hence it becomes a mere matter of sorting. —which is always necessary,—and at the same time enables the tree to produce better fruit as well as develop fruit buds for the next year's crop. Where thinning is necessary it is very seldom that the number of bushels is reduced owing to increased size, and the net returns are invariably increased because of improved quality, more regular crops, and simplified handling.

ADDING FERTILITY.—If the observance of the foregoing does not bring results or is not practicable, some form of fertilization may solve the difficulty. Barnyard manure used at the rate of eight to 12 tons per acre is highly satisfactory, although sometimes color may be reduced, but this is largely overcome by allowing the fruit to hang a little longer. Where manure is not available, commercial fertilizer can be safely used instead, and, in fact, is frequently more economical provided the supply of humus is properly maintained by use of cover-crops or other means. The character of the soil has much to do with systems of fertilization if maximum results are to be had, but this is determined only by local tests. In general, an application of 30 pounds actual nitrogen, 60 pounds actual phosphoric acid, and 25 to 50 pounds actual potash per acre of mature bearing trees seems to come nearest the average requirements. These amounts are approximately supplied by 500 pounds of a 6-10-5 mixture. For younger trees these quantities may be reduced according to the area covered. Where potash is known to be lacking the larger amount should be used, otherwise the smaller amount, according to Bulletin 121, Pennsylvania Experiment Station.

With respect to the application of fertilizer, our experience has been that surface dressings are perfectly satisfactory no matter in what form or under what system of culture they are used. There is no objection, however, to working the manure or fertilizer into the soil. Our system of application is to cover an area extending from within a short distance of the trunk to somewhat beyond the tips of the branches, making it heaviest under the outer two-thirds of the latter. The best time to apply these materials is possibly shortly after the fruit has set, as the rate of application can then be varied to correspond with the size of crop.

COLOR.—Of the many factors involved in producing color maturity and sunlight appear most important. It has been a common impression that anything which tended to produce abundant growth of tree or large size in fruit directly interfered with the production of color. Hence nitrogenous fertilizers were thought to be injurious in this regard and should be used with care. The most recent study, however, tends toward the conclusion that the difficulty is largely due to the lengthening of the season of maturity, and that by allowing the fruit to hang longer the trouble is largely overcome. At the same time excessive growth, particularly with mature bearing trees, from any source should be avoided, as it may not only interfere with color but actually reduce the quantity of fruit. As a matter of fact, however, nitrogen is very frequently a most important need in securing desirable size and yields, and if color should be a little tardy in developing this may be overcome by allowing the fruit to hang longer, by pruning so as to admit more light, and by fitting the system of soil management to these various needs and practices. Sod mulch appears to combine these two characters of yield and color in a very satisfactory manner.

"A CERTIFIED BOY" AT THE LINCOLNDALE SCHOOL.

THE OAK COTTAGE AT LINCOLN AGRICULTURAL SCHOOL. FIG. 342.

SPRAYING.—Excepting mechanical injury the freedom of fruit from blemishes is very largely a matter of spraying. Undoubtedly pruning, location of orchard and general sanitary conditions have a decided influence on insect and fungus troubles, yet we must look to spraying as the surest and most standard means of control. It is difficult to give specific directions for spraying that will fit all cases. One recommendation which comes nearest applying generally is to make one application of lime-sulphur in late Fall or, even better, just before the buds open in Spring. This material is intended primarily for the San José scale, but it has so many benefits in addition that the treatment is regarded by many as an annual "house cleaning," and therefore necessary even in the absence of scale.

The following table of treatments is designed to include the more common insect and fungus troubles of the apple, although it is seldom that these are all combined in a single orchard. In fact, for growers other than those engaged in commercial orcharding, the treatments numbered 1-4 are usually adequate. Where but two applications are possible, as may be true for the home orchard, and where scale is not present, treatments 3 and 4 will possibly be the least amount of spraying permissible, if the fruit is to be marketed or if decent fruit is desired for the home.

GENERAL SPRAY TREATMENT FOR APPLES.

1. Lime-sulphur sp. gr. 1.03 in Winter, or preferably just before buds open in Spring, for scale. For aphids add "black leaf 40" (1 pt. to 100 gal.) and apply when buds show a little green.

2. Lime-sulphur sp. gr. 1.01 when blossoms show pink, for scab. If canker worm or bud moth is present 2 lb. lead arsenate to 50 gal., and if aphids or red bugs, 1 pt. "black leaf 40" to 100 gal.

3. Same as No. 2, with 2 lb. arsenate lead, for curculio and Codling moth. Apply when 80 per cent of petals have fallen. If aphids or red bugs are present give same treatment as above.

4. Repeat No. 3 12 to 15 days later for scab and Codling moth.

5, 6 and 7. Beginning August 1, Bordeaux 3-3-5 every two weeks for bitter rot fruit and leaf spots, with 2 lbs. arsenate of lead to 50 gals. of No. 5 for second brood Codling moth, and if necessary, same quantity of arsenate to 6 and 7 for leaf-eating caterpillars.

There is hope that lime-sulphur may entirely replace Bordeaux and thus avoid the injury (russeting) caused by the latter. So far, however, Bordeaux appears most effective against the bitter rot and the fruit and leaf spots.

PRUNING.—From the standpoint of quality of fruit, pruning should aim at the development of low, open-headed trees, and thus permit of easy and thorough spraying, and admit an abundance of air and sunlight, which are so important in securing high color and freedom from fungus infection. Remember to "Let a little sunshine in."

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

Oiling Tools; Pruning Tomatoes.

WILL you give me a formula for making an oil suitable for using on garden tools to prevent rust in the Winter? I believe this would pay in the longer service the tools would give. Could the same oil be used on guns? 2. Do you think pruning tomatoes would increase their quality to pay for the trouble? If so, please give me an idea of how it should be done. I want to get quality in preference to quantity if I can. H. B.
Memphis, Tenn.

I do not know anything better to preserve tools from rust than the ordinary coal oil product used for axle grease. But for guns you need a finer oil, such as is made and sold for sewing machines.

2. I do not think that pruning tomatoes increases the crop, in fact it rather diminishes it, but increases the quality. By training to single stems on stakes, we can plant closer and get more fruit of good quality from a given area. I plant in my garden tomatoes in rows three feet apart and two feet in the row, and train to a single stem, pinching out all side shoots or suckers that appear in the axils of the leaves, and stopping the plants at about six feet high or sometimes less. Where tomatoes are allowed to tumble on the ground it is almost impossible to keep them from being smothered by the crab grass after they cover the ground, and training to stakes enables us to keep them clean. I start the earliest tomatoes in the greenhouse and transfer to cold frames to get strong, and as these early plants depreciate in midsummer, I sow seed outside in early May to give me the late crop of good quality. These plants are now only a little over two inches high, and will be transplanted anytime in June to give us fruit till frost, and these can be kept clean of crab grass and are let tumble on the ground.

W. F. MASSEY.

Constructing a Root Cellar.

LAYING OUT PLANS.—Where there is a hill about the height one wishes his root cellar it is a very simple proposition, with lots of hard work. Just dig back in the hill the length you want the building, wide enough to admit of laying up the walls. Having dug out space enough build wall of stone, concrete or concrete blocks. If twelve feet wide you can arch over with concrete for roof. To get the form for arch take a one by two inch lath, bore a hole in end, put a half-inch bolt through, stick in the ground on some level place, and 12 feet from bolt bore a small hole a lead pencil will fit in. Lay boards 12 feet long so when moving pencil around it describes a part of a circle. Cut on this line and you have the form of arch. Put false work inside building to support forms, which you will make of sufficient number to support concrete until it gets set. Cover forms with smooth lumber and you are ready for the concrete.

PREPARING CONCRETE.—Mix concrete well, apply four inches over form, then lay strips of woven wire fencing over this, and put on four or more inches concrete, and in two weeks you can remove false work from the inside and later cover the whole structure with dirt removed in making the excavation. By building wall out at entrance and banking dirt in front except at door you will have a root cellar that will not freeze in the severest weather. Of course there are to be two doors, close fitting, one inside, the other a foot or more out, so enter first one, then the other.

BUILDING ABOVE GROUND.—Where one must build above ground it is a harder and more costly proposition. I will endeavor to describe one 12 by 20 feet inside, seven feet high. Digging a trench below frost line start foundation of concrete 20-inch wall to within eight inches of surface; four-inch hollow to surface, set 2x4x9 feet in hollow, two feet center to center. Board up with rough lumber seven feet six inches inside, eight feet outside, both sides covered with tar paper, strips running up and down, set 2x6x7 feet six inches inside boarded up with shiplap, 2x6, spiked across top to center studding, gaining in boarding to let down to seven feet in clear. Sawdust is now packed and tamped between 2x6, putting in a little at a time, dampen a little, tamp thoroughly. Put board floor over top, cover six inches with sawdust, set 2x6x8 feet six inches outside, board up with rough lumber and fill with sawdust as before. Spike two 2x4 on top of each other for plates. Spike 2x6 across building under plates. Lay on another floor and cover with sawdust, both floors; cover with tar paper before putting on sawdust. Proceed to put on roof, using close sheathing and galvanized iron. Put pressed steel brick siding on, and for window two 20x24 sash, gain in, on opposite side of sash set in another glass, one sash on inside of frame, other on outside of frame. Put door of good matched lumber on inside of frame, door of double thickness on outside of frame. A ventilator was put in center of roof, which could be closed in severe weather. If the work is well done it will stand the severest weather without freezing. The important point is to have the hollow wall, sides and top, for no solid wall, though it be two feet thick, will keep out frost. Care must be taken to pack the sawdust well, especially around window and door frame, or it will settle in time, and leave vacancies for the cold to get through, and the sashes with glass on either side are quite necessary in severe climates, using two sashes in the one frame, and the fewer windows the better. JACOB SHULL.
Wisconsin.

Rules of the Road.

IF an automobile comes up behind me have I got to turn to the right or left or can I stay in the wagon track, provided there is room enough to pass without getting his automobile in any out of the way place? 2. How many days is a child obliged to go to school between the ages of 12 and 14 and again between 14 and 16, and what grades must he pass before he is permitted to stay out of school and do labor? J. F. F.
New York.

1. You must turn to the right. You cannot stay in the middle of the road; you must give him half. The laws provide that a motor vehicle meeting any vehicle shall seasonably turn the car to the right of the center of such highway and that on overtaking any such vehicle, the automobile shall pass to the left side and the driver of the vehicle shall turn to the right so as to allow free passage on the left. It also provides that the driver of an automobile must give reasonable warning of its approach and to use every reasonable precaution to insure the safety of the person using the highway, and that the motor vehicle or motor cycle must, on request or on signal by putting up the hand from a person riding, leading or driving a restive horse or other animals, bring their machine to a stop and remain stationary as long as may be reasonable to allow such animals to pass and must also stop their engine when necessary.

2. Every child between eight and 14 years of age in proper and physical condition to attend school shall do so during the entire time that the school in the district shall be in session and so must each child between 14 and 16 years of age, not regularly and lawfully engaged in any useful employment or service. A pupil between the ages of 14 and 16, if he wishes to work, must have a school record certificate certifying that he has attended school regularly during the preceding year and that he is able to read and write, etc., and has completed the work prescribed for the first six years of the public elementary school. M. D.

Sea Crystals.

WHAT are the chemicals used to compose the "sea crystals" sold for use in open fires of logs? When thrown on the fire the crystals give various brilliant colors to the flames, such as are produced by a fire of driftwood.
E. R.

The colors which are noticed in the flames of burning driftwood are due to the presence in the wood of the sea salt. This salt is not pure sodium chloride, but contains also small amounts of calcium salts and potassium salts. The sodium salts give the yellow color, the calcium salts orange, and the potassium salts a sort of violet. Then most ships have much copper work about them, which is acted upon by the sea, forming copper salts, which impregnate the wood to some extent. These salts blaze with a greenish or bluish flame. These colors of flames are distinctive and used in chemical analysis to distinguish the presence of the various substances. Any "sea crystals" which give these various flames must be a mixture of the various substances named above. If you purchase any substances containing calcium, sodium, potassium and copper salts and mix them together you will get the fancied effect. The carbonates are the least desirable, for they do not show up as well in flames of low temperature. Throw a little table salt upon the flames and you will get the yellow color, and possibly, if it is not pure, some of the other colors. The sea salt sold for bathing purposes will give brilliant results. R. P. C.

Reducing Lumpy Fertilizer.

I AM using about four tons nitrate of soda and three tons sulphate of potash yearly and find the breaking up of the lumps quite a problem. These I now sift out with a moulder's riddle, one-quarter inch mesh, throw on mixing floor and scuff out with a pair of heavy shoes. Am looking for an easier and quicker way. Is there any hand-mill on the market which will do this work satisfactory, or some better way? D. A. R.
Florence, Mass.

We have frequently advertised an outfit of mills for crushing chemicals, soft bones and dried hen manure. Such a mill can be made very useful on the farm.

The Letter on the Dime.

WHAT is the significance of a small letter, on some dimes, placed close to the milled edge under the words "One Dime?" What letters are so placed on these coins? E. H.
Glenarm, Md.

Hundreds of letters are received each year by the Treasury Department asking this question. There are so many that a printed slip has been prepared by the U. S. Treasurer:

Coins struck at the Philadelphia Mint have no mint mark; those struck at all other mints of the United States are distinguishable by a small letter near the bottom of the coin. These letters are "C" for Charlotte, N. C., discontinued in 1861; "CC" for Carson City, Nev., discontinued in 1893; "D" for Dahlonega, Ga., discontinued in 1861, and Denver, Colo., since 1906; "O" for New Orleans, La., discontinued July 1, 1911; and "S" for San Francisco, Cal.

A Letter From Mexico.

WE are still alive and feel safe (myself and mother). We had a good surprise about three weeks ago. I had not been going to the post office for some time, and the postmaster stopped me on the street and told me there was a big bundle of mail for me. In the lot were two R. N.-Y.'s; one was only a week old and the other was November, 1913. It was just like hearing from home to get THE R. N.-Y. once more. Since then I have been getting three and four copies a week, some late and some old, but all good to read.

One thing about the paper was that it was not filled up with hair-raising yarns telling of the terrible things that were taking place here, as some of the daily papers were doing that were brought in by the automobiles carrying in guns, etc. We live about two miles out of Victoria and were there through the two-days' battle when the rebels took the town. We were bothered but very little. The rebel soldiers were coming and going from the house all the time, some for something to eat and some for water. All were very nice, all willing to pay for meals that we gave them. Since the fight every week or two someone comes in to see how we are getting along and to let the governor know if we are molested in any way. Things have been very dull here, but the last two weeks lots of the Mexican residents are coming back again. Business houses are being fixed up getting ready for business again. MARK V. JOHNSON.

Want to Know.

ONION SETS.—Will you kindly submit to the readers of your paper the following inquiries? I wish to plant onions for onion sets, and should like to hear from some of the readers the methods employed in planting, care and harvesting. Yellow Strasburg has been suggested as a good variety. R. G. C.

Do You Know About Nitrogen?

Of course you know that it is the plant food that is hardest to keep in the soil—and a food plants can't do without. That's why you use nitrates. But do you know that there is now a better, surer, less expensive way than using nitrates? Do you know that all the Nitrogen in the air can be used for food for your legumes if you inoculate the seed with

Ferguson's NITROGEN BACTERIA

Very simple and easy to use, and the results are wonderful, as we can prove to you by hundreds of letters. The Bacteria, gathering Nitrogen from the air and storing it on the plant roots, not only produce stands of remarkable size and quality but enrich the soil for future crops. The same bottle of Ferguson's Bacteria contains all the varieties necessary to inoculate the seeds of Alfalfa, Peas, Beans, Clover, Vetch, any legume.

Costs little—Far less than the best commercial Fertilizer

Quarter-acre quantity, 50c; 1 acre, $2; 5 acres, $9. Let us explain why you need Nitrogen Bacteria and why Ferguson's is best. Write for special booklet N—free.

PROTECTING RIVER BANKS.

REPLYING to request of John Alan Hamilton, Erie Co., N. Y., on page 743, relative to protecting banks of stream, would suggest that he build what we call, up in our Catskill country, a stone and timber "docking." This consists of a layer of water beech brush, butts up stream, saplings about 20 feet long, piled four feet thick, then a layer of rocks and a layer of tree trunks at least two feet in diameter as a backing and rock over it. Docking should run at an angle to stream and if properly constructed, will build up a bar the length of docking. I have built two, one 36 feet long, and one 40 feet long, 10 feet wide. Top of docking should be two feet above high water. I think if this docking was built from the shore to a point just beyond the point of this island, the stream will fill in solidly with sand and grass beyond the end of the docking. This is the way the Dutch do, to make the sea "keep itself out." My dockings cost $25 each. I shall build two more. Our farm is on Neversink River, Sullivan Co., N. Y., and while the Neversink is a limpid and beautiful stream, it is awful when on the rampage and terribly destructive to property.

HENRY C. COUSE.

John Alan Hamilton wants to know how to protect the bank of a stream from washing. Commence at the lower end of the space to be protected, pile brush or small trees, the butts against the bank and the tips extending out into the stream, pointing down stream somewhat. Build up to the top of the bank, then load the brush with large stones, the larger the better, to prevent the brush from washing away. Be sure that the protection extends up stream as far as there is danger of caving, so that the current may not eat in behind the brush and wash it out. It is well also to drive large stakes down through the brush into the earth below. If these stakes are of willow they will take root and afford additional protection. There are miles and miles of this kind of work along the river banks in Vermont. Another way is to place logs of any length in front of the caving bank, notched and built up with short logs reaching back to the banks after the style of a log dam or the side of a block house. The short logs must be loaded with stones to prevent washing away, and the space between the bank and the rampart had better be filled with brush and stones sufficiently at least to prevent any current passing that way. If the gentleman has not plenty of stones for the purpose we Vermonters would be glad to furnish them gratis. E. G. H.

New Haven, Vt.

Stakes and Brush Piling.

EVIDENTLY the cause is higher up the stream, where the opposite bank has been worn to an angle that throws the current against the crumbling bank. The trouble could be remedied by putting a line of sheet piling at the point above to direct the current into the old channel, or a line of the same across the new channel, or still, as a protection in front of the bank that is suffering. This would be an expensive job, and would require a great deal of labor or the rigging of some kind of pile driver. Doubtless this remedy will be recommended. I would suggest the practice of some of the government engineers in treating washes, which is not expensive, and the material is probably at hand:

Drive a line of piling, that is posts say six inches or over in diameter, setting them deeply in the bed of the stream so it would not eat them out, placing them a couple of feet apart, beginning a little above where the crumbling of the bank begins, and carrying them a little below where the worst of it ends, and putting them a couple of feet from the bank. If however there is a deep cut, it would be well to carry the line across it and then put a second line a couple of feet behind the first at that point. I should then cut any small growth of willow, hickory or in fact any kind of similar growth, or even brush, and tie it in bundles and throw it between the bank and the piling, and if rocks are handy after filling the space pile them on top to sink the bundles. If rocks are not at hand, bags filled with sand or pebbles will do as well, but loamy earth should be avoided as it will dissolve out. Should the stream undercut any in the bed, the bundles will sink and fill the place and keep the wash from touching the bank. The piling could be carried more above or below if it is seen the bank is caving at either or both points later. These bundles will never rot so long as they are under water. I believe this would be the most practical method, for it will

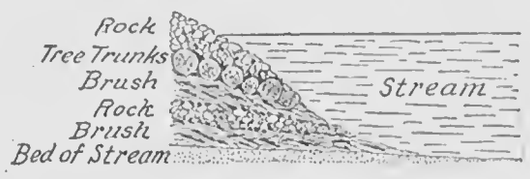

DIAGRAM OF DOCKING.

take the least outlay of cash. I have seen bad washes in gullies stopped by piling loose brush where the wash came down with heavy rains.

Alabama. MARSENA A. PARKER.

The only way Mr. Hamilton can permanently protect the banks of his stream is by straightening the channel and building walls of riprap, masonry or cement along both sides. To be really permanent this should be carried back to both sides of the valley at the upper end. Temporary relief may be secured by the building of concrete or masonry walls on the outside of each curve. This would be permanent if it were not for the fact that the curves of every stream are all the time moving or trying to move down the valley and sooner or later a wide curve is likely to get behind the retaining wall and leave it stranded. In times of freshet this may be done in a few hours and a large outlay of time and money be rendered useless. Retaining walls for this purpose should go well below the stream bed and be built with a flare out at the bottom to prevent the stream from cutting under them and letting them fall over. ALFRED C. WEED.

Wayne County, N. Y.

JACK: "Bridget, did my wife just come in?" Bridget: "No. sir. That's the parrot you hear a-hollering."—Judge.

Clarifying Maple Syrup.

WILL you advise me how to settle maple syrup after boiling down? New York. I. W.

The ordinary household method of clarifying maple syrup is to strain it while hot through muslin cloth and after it has cooled to add a little sweet milk or eggs beaten up. It is then returned to the fire and allowed to come to a boil. As it approaches the boiling point the coagulated albumen of the eggs or milk rises to the top with the finer particles of dirt entangled within it. This is quickly skimmed off, not being allowed to boil into the syrup. The amount to use varies, but will be learned after a trial or two; ordinarily, perhaps, one egg or a half pint of milk will be sufficient for a gallon of syrup. M. B. D.

Acetylene Waste.

FOR illuminating purposes I am using acetylene, until the disposal of the refuse has become a trouble. I saw an article referring to this, but I do not recall just what the directions were for its use on land. Is it advisable to spread this on land which needs lime in its liquid state as it goes from the generator, or must it stand a certain length of time before it is suitable to use on land?

Rochester, N. Y. W. W.

This refuse contains lime and nothing else of any particular fertilizing value. This lime is of about the quality of fine limestone, and is not equal in value to slaked lime. It is not a good plan to use the liquid as it comes from the generator, as this liquid may contain a principle which would injure certain crops. After exposure for a long time, however, this refuse is all right for use. Lime of that character would be most useful on very light soils, on soils that are sour or very heavy clay soil. It may be spread on after plowing and well harrowed or raked in.

SUBURBAN GARDENER: "This 'sure death to bugs' I purchased here doesn't seem to kill the pests at all." Salesman: "Ah! you see, sir, the properties of this preparation are not to kill the bugs at once, but to undermine their constitutions."—New York Evening Post.

Reo the Fifth—$1,175 With Electric Starter and Complete Equipment
F. O. B. Lansing

This is the Super-Car

Reo the Fifth—Mr. Olds' great car—is not built by usual standards. It is built for men who want a super-car.

It is built for years of perfect service—built to withstand abnormal strains. It is built to bring troubles, upkeep and repairs down to the lowest notch.

The driving parts are one-half stronger than necessary. They meet the tests of a 50-horsepower engine. The steel is made to formula. The gears are tested for 75,000 pounds per tooth.

There are 15 roller bearings—190 drop forgings. There is a costly clutch to prevent gear clashing. There is a simple method of shifting gears.

We spend six weeks on each car to get utter exactness, and to properly test each part. No other car in this class was ever built so slowly, so carefully, in such a costly way.

The result soon shows. The parts stand the strains. There is freedom from trouble and repairs. The car stays new. It doesn't grow noisy. When lesser-built cars begin to show their shortcomings, Reo the Fifth shows its staunchness.

Rough Usage

Under normal conditions—on smooth roads—lesser cars may do. But the farmer, on the usual country road, needs a car like this. He needs these margins of safety, this vast over-capacity, this super-strength.

Men are finding this out. Every year, thousands of men who have owned other cars are buying Reo the Fifth. And every buyer tells other men to buy it.

New This Year

This year comes the new streamline body. There are many new ideas in equipment. The car excels in appearance now as it does in the hidden parts.

And there comes a new price—$220 less than last year with electric starter. So price no longer bars you from the utmost in a car.

A thousand dealers sell Reo the Fifth. Ask for our catalog and address of nearest dealer.

EVENTS OF THE WEEK.

DOMESTIC—The La Salle Street Trust and Savings Bank, of which William Lorimer, who was expelled from the United States Senate, is president suspended business at Chicago June 12, when Daniel V. Harkin, State Bank Examiner, took charge of it, and at the same time of its three subsidiaries—the Broadway State Bank, the Ashland-Twelfth Street Bank and the Illinois State Bank. All were closed pending a report by the examiner. The four banks were known as the Lorimer-Munday chain of banks. The La Salle Street Bank was the main institution, the others being outlying concerns, whose balances and reserves were carried to a great extent by it. Of their deposits, $966,000 consists of city funds. The bulk of this amount, $650,000, is on deposit with the La Salle Street Trust and Savings Bank. The sanitary district of Chicago has $75,000 in the La Salle Street Bank.

The American liner New York was rammed at 3:26 in the morning of June 13 by the Hamburg-American liner Pretoria, eastward bound, in a dense fog about 400 miles east of the Ambrose Channel light. Nobody was injured in the collision. There was no panic among the 655 passengers and crew aboard the New York, 25 of whom were little children, when the impact of the slow moving vessels routed the sleepers from their berths.

Five men are dead and ten are in hospitals with serious injuries as the result of a gas explosion in a trench at Columbus, O., June 14. Five other men also were burned, but only slightly. It is believed that a cap on a joint of gas pipe was blown off while the men were laying the main, and that the escaping gas was ignited by a lighted cigarette.

Adlai E. Stevenson, long a familiar figure in State and National politics, died at Bloomington, Ill., June 13. He was the son of a Scotch farmer in Christian County, Kentucky, where he was born on October 23, 1835, and where he received his early education. When he was 16 his family went to Bloomington, Ill., to live, and there young Stevenson hauled logs, taught school and saved money with which to go to college. Mr. Stevenson was a delegate to the Democratic National Convention of 1884 in Chicago, and after Cleveland's election was appointed First Assistant Postmaster-General. In 1892, during the efforts to bring about Cleveland's renomination. Mr. Stevenson's loyalty to Cleveland and his effectiveness as an organizer led to his nomination as Vice-President, and he was elected. Mr. Stevenson was a nominee for the Vice-Presidency on the ticket with Bryan in 1900, and in 1908 was a candidate for Governor of Illinois, but was defeated by Governor Dineen after a contest in the Legislature.

Steps were taken in the Senate at Washington, June 15, for an official investigation into the exploitation of a North Carolina gold mine through the letterheads of two of the Senate committees. Senator Overman of North Carolina and Senator Chilton of West Virginia, who own stock in the mine, and whose employees are blamed for the use of the Senate stationery, asked for an investigation. Senator Overman introduced a resolution authorizing the employment of a special committee of five senators. The inquiry will include not only the use of the Senate stationery, but also the sending of an employee of the Treasury Department at the Government's expense to the North Carolina property for the purpose of investigating the mine.

The cross-examination of Captain Kendall of the ill-fated Empress of Ireland by C. S. Haight of New York, counsel-in-chief for the owners of the collier Storstad; the statement by Captain Kendall that the Storstad changed her course after the fog had enveloped the two ships, and the counter hypothesis of Mr. Haight that the collier kept straight on, but that the Empress stopped across her bows, were the salient contributions at the first day's session of the official commission's inquiry at Quebec, June 16. Capt. Kendall, answering Mr. Haight, said he dropped his pilot at Father Point, a little more than a mile from the dock. After he sighted the Storstad he changed his course to north 72 east magnetic. When the fog came between the two vessels he stopped. The change would tend to take him nearer to the Storstad. He heard the whistles of the Storstad and thought he could rely upon his opinion that they came from the starboard, because there was no wind. Mr. Haight asked how it was that when he saw the green light of the Storstad and the Empress was showing her a green light he stopped. Captain Kendall said that when he saw the fog coming he thought it his duty to stop as a safeguard. The collier had evidently changed her course.

Mt. Lassen, California, which has been showing volcanic disturbance since May 30, was in active eruption June 14. One man was killed and one seriously injured. The height of the eruption has been reduced, it is believed, by the great enlargement of the crater in the sixth explosion. The entire snow-capped peak has been blanketed with a black covering of ashes. The new eruptions failed to deter scores of persons from scrambling up the mountain, taking pictures and venturing near the smoking craters.

Woman suffrage won a decisive victory in the Illinois Supreme Court June 13, when the court sustained the votes-for-women law passed by the Forty-eighth General Assembly. Judge Dunn wrote the opinion sustaining the law. Justices Vickers, Cartwright and Carter concur. The three Democratic members of the court—Justices Cooke, Farmer and Craig—dissent, the two latter filing dissenting opinions. The opinion of the majority of the court construes the section of the law regarding public policy questions to mean that women can vote only for such questions as are not specified in the constitution.

FARM AND GARDEN.—The United States Forestry Commission has purchased almost the entire Vanderbilt estate, consisting of about 86,700 acres of the Pisgah forest property in North Carolina for $433,851. The property will be turned into a national game preserve.

The twentieth annual convention of the International Apple Shippers' Association will be held at the Copley-Plaza Hotel, Boston, Mass., August 5, 6 and 7. Speakers of national prominence will address the convention and speak at the banquet. Among the subjects that will be discussed are the export problem and ocean transit, storage in transit, transportation, cold storage and general legislation, grading laws, publicity, international tariffs, National Apple Day, etc. The Associated Apple Advertisers of America are also planning to attend. One of the important features of the meeting will be the apple exhibit. Copies of the governing rules, classes and prizes may be had from R. G. Phillips, Secretary, 612 Mercantile Building, Rochester, N. Y.

An international conference of Governments on the protection of birds useful to agriculture was suggested at Paris, June 11, at the final meeting of the International Congress of Plume Dealers. Action was taken to seek to bring pressure to bear upon the various Governments for the calling of such a conference. Resolutions were adopted urging the repeal of the section of the United States tariff act prohibiting the importation of plumage and the similar legislation in Canada, and urging that the proposed legislation of the British Parliament along similar lines be killed.

The Summer meeting of the New Jersey State Horticultural Society will be held at the home of John H. Barclay, near Cranbury, Middlesex County, N. J., July 15. Trolleys will be met at Scott's Corner, about 15 minutes walk from the farm.

The Federal Grand Jury began an investigation June 12 at Chicago into the alleged combination of commission merchants throughout the country to control prices of fruits and vegetables. Criminal prosecution is sought by District Attorney Wilkerson. It was reported that the Attorney General had directed grand jury investigations in New York, Pittsburgh, Kansas City and Denver, as well as Chicago.

OBITUARY.—William T. Bassett, long known and highly esteemed in the nursery business, died at Hammonton, N. J., June 7, in his eighty-ninth year. Mr. Bassett was a native of Ashfield, Mass., and was engaged in general farming until 35 years old. In 1861 he engaged in business in Vineland, N. J., and from there moved to Hammonton, where he began to deal in small fruit plants. This laid the foundation of his extensive business, which, as it extended, included a great variety of flowering plants. He introduced many valuable new plants, including new varieties of Dahlias, which he grew extensively, being a large shipper of this flower to the Philadelphia cut-flower market. Mr. Bassett, who continued active in business until 1910, is survived by two sons, who were associated with him in his firm.

ADMINISTRATION. — The amended bill repealing the tolls exemption clause affecting coastwise shipping of the United States in the Panama Canal Act passed the Senate June 11 by a vote of 50 to 35. Eleven Democrats voted against the repeal, but this loss was more than offset by 13 Republicans who supported the President. As to the actual effects of the legislation, it will subject American coastwise vessels passing through the Panama Canal to tolls of $1.20 per net registered ton, which is the rate charged all other shipping. The opponents of the repeal legislation contend that it will discourage the development of American shipping and will result in an advantage to the transcontinental railroads in the matter of freight movements. It was not so much domestic as international considerations, however, that influenced President Wilson. He found that all the Powers of the world were practically unanimous in the belief that the United States was violating the Hay-Pauncefote treaty, which promised equal treatment to all nations in the use of the Panama Canal.

COMING FARMERS' MEETINGS.

School for Leadership in Country Life, New York State College of Agriculture, Cornell University, Ithaca, New York, June 23 to July 3, 1914.

Summer meeting, Virginia State Horticultural Society, Charlottesville, Va., July 15.

Summer meeting, New Jersey State Horticultural Society, farm of J. H. Barclay, Cranbury, N. J., July 15.

Summer school of agriculture and country life, Massachusetts Agricultural College, Amherst, June 30–July 28.

Annual Poultrymen's convention, Massachusetts Agricultural College, Amherst, July 22-24.

Georgia State Horticultural Society, Summer meeting, Griffin, Ga., August 5-6.

International Apple Shippers' Association, twentieth annual convention and apple exhibit, Copley-Plaza Hotel, Boston, Mass., August 5, 6, 7.

39th Annual Convention of the American Poultry Association to be held at Chicago, Ill., August 8th to 15th, 1914, inclusive.

National Dairy Show, Chicago, Ill., October 22-31. The following meetings and conventions will be held in connection with the show: American Association Creamery Butter Manufacturers, Oct. 26. Holstein-Friesian Association of America, Oct. 26. International Milk Dealers' Association, Oct. 26 and 27. Conference, Secretaries of State Dairymen's Associations, Oct. 27. Official Dairy Instructors' Association, Oct. 27. National Dairy Union, Oct. 28. American Dairy Farmers' Association, Oct. 28. Council of the National Dairy Show, Oct. 28. National Association of Creamery Managers and Owners, Oct. 28. American Jersey Cattle Club, Oct. 28. National Association of Ice Cream Manufacturers, Oct. 28, 29 and 30. International Association of Dairy and Milk Inspectors, Oct. 29. American Guernsey Cattle Club, Oct. 29. Congress of Marketing, Oct. 29. Milk Producers' Association, Oct. 30.

Annual Show of the Paterson, N. J., Poultry, Pigeon and Pet Stock Association, November 18-21.

Indiana Apple Show, Tomlinson Hall, Indianapolis, Ind., November 18-24.

ESTIMATING THE APPLE CROP.

WHAT Mr. Teator has to say on page 819 is timely, and should bring out some new ideas about estimating the apple crop. So far as I am personally concerned the estimates by the Fruit Growers' Association in late years have been of but little value, owing to this "per cent. method" of estimating on a crop. I think some members become confused on this point, and often carelessly put down figures that are mere guesswork. In estimating on a coming crop, why use the word per cent. at all? Along with the other questions let the secretary put these two to each member.

"How many barrels or boxes of apples do you expect to have the coming year?"

"How many barrels did you have last year?"

Then let the secretary publish the summary of these questions and each member could draw his own conclusions as to probable prices to come. Most apple growers of experience can estimate fairly accurate what the coming crop will be. A grower certainly can tell how many he had last year, and if we can get a response from each member this ought to give a fair idea of the coming crop. This association of something over 1,000 members ought to represent 90 per cent. of the important apple producers of the State. If we wished to go a little further we could give a comparative estimate on crops of neighbors not represented in the association. Our own crop this year will be two-thirds lighter than last year, as this is our off year for Greenings.

Seneca Co., N. Y. W. A. BASSETT.

CROP REPORTS.

REPORTS received by the Kansas State Horticultural Society indicate the prospects for the Kansas fruit crop to be as follows: For the State compared with the June prospects for the past five years:

	1914	1913	1912	1911	1910	1909
Apple	53	53	71	33	57	21
Pear	46	40	66	27	31	8
Peach	39	26	53	10	50	3
Plum	42	41	60	36	51	16
Cherry	58	64	70	63	21	26
Grape	68	79	73	69	60	58
Strawberry	53	70	68	37	40	45
Raspberry	69	70	54	46	39	50
Blackberry	67	69	46	54	51	61

June 10. Our products are mostly peaches, raspberries, blackberries, potatoes, sweet potatoes and other fruits and vegetables which go to market later. The weather has been so dry that strawberries were a very short crop, sold for about 10 cents per quart. Cows sell for $50 up. Milk all sold at retail, eight cents per quart. Some are changing their cows for goats for home supply of milk. Horses sell for from $150 to $250. None raised here for sale, but that is what farmers have paid for them.

Hammonton, N. J. M.

June 16. Horses and cows are very high. Calves, live, 10; sheep, live, five cents per pound; lambs, live, $5 to $5.50. Butter 24. Eggs 22. The wheat crop in this section is a failure, some fields not worth harvesting. Oats and corn look well, but need rain badly. Prospects for peaches very good. Apples and pears fair; cherries are selling for $1 to $1.25 per 16-quart basket. Hay crop is short due to the dry weather. J. A. W.

Lebanon, N. J.

1913 RECORD Magnificent Crops in all Western Canada

All parts of the Provinces of Manitoba, Saskatchewan and Alberta, have produced wonderful yields of Wheat, Oats, Barley and Flax. Wheat graded from Contract to No. 1 Hard, weighed heavy and yielded from 20 to 45 bushels per acre; 22 bushels was about the total average. Mixed Farming may be considered fully as profitable an industry as grain raising. The excellent grasses full of nutrition, are the only food required either for beef or dairy purposes. In 1912, at Chicago, Western Canada carried off the Championship for beef steer. Good schools, markets convenient, climate excellent. For the homesteader, the man who wishes to farm extensively, or the investor, Canada offers the biggest opportunity of any place on the continent.

Apply for descriptive literature and reduced railway rates to Superintendent of Immigration, Ottawa, Canada, or to Canadian Government Agent.

CITY UNEMPLOYED AND FARM HELP.

A Woman's Experience.

I BELIEVE myself to be the pioneer in this work, having operated at Pierpont Manor, Jefferson Co., N. Y., several years, but ill health and moving here among strangers in the hope of bettering it in a somewhat milder climate, has prevented the work for two years. I cooperated with the Joint Application Bureau (C. K. Blatchley), the Immigration Bureau (Mr. Green), the Jewish Association and Brace's Farm School, and the men were sent directly to our farm and either boarded until placed in the particular niche which they seemed the most adapted to, sent direct to the farmer who had advanced the railroad fare, or held until employer could arrive in answer to telephone or card, as the case might be. Every nationality except Italians and Orientals were represented, and they were picked men; no "roughs" or "scurfs" were supposed to be sent to our place, only fine, healthy, honest fellows, but sometimes a man would be sent for the season upon request of friends who wished him sent out of the way of temptation. These, however, never proved satisfactory, for if they were looking for temptation, it could be found readily enough in the country as well as the city. Always they seemed willing and anxious to get to the farm, but out of the hundreds of men, boys and women who were sent to me, only a comparatively few made good. Almost immediately upon their arrival the "wanderlust" seemed to possess them, and with one excuse or another and often with none at all, they would travel on. Some of them returned to me for a better position; in fact they called me—on account of my white hair I suppose—"the good mother," and they seemed to think I could and would look after them as I would a lot of little children. I tried to live up to their expectations, and even now I receive occasionally grateful and appreciative expressions of regard, but it certainly was frightfully trying and no ordinary woman could long endure the strain.

Many of these men, in fact the greater part of them, especially the New Yorker born and bred, only worked long enough to secure a little money, perhaps a month's pay, $15, $20 or $25, according to their competency, and then back to the city they would go, or if foreigners, on to some other city. Syracuse seemed to be the great Mecca. Some went West, but these in many instances, wrote me later, pitiful appeals for "another job East."

My boys—I called them "my boys" even if they were gray-headed—seemed to do much better when placed far apart, and even then they would somehow gravitate together, walking miles to see a "pal" or even a "New Yorker." If he had never seen or heard of him before it did not matter. Then always trouble would be forthcoming, and they would go marching on or beating their way back to the city; anything then seemed better to them than work on a farm. Their excuses were many and varied; too hard work; dearth of amusement; lack of companionship; not enough, or the right kind of food; and the irony of it, they would return to the city to stand in the "bread-line" again.

My experiences, many and varied, were often pathetic or were comedy with these men. Some wished to earn enough to bring their families from "the old country" and were really anxious to work. There were young inexperienced married couples and families of five or six, some with new-born babies. The memory of it is almost appalling, as I recall the work and the responsibility.

I could fill a book with amusing and pathetic experiences. For instance, a fine stalwart young New Yorker was sent to me upon his own request, that he might be free from the temptation of strong drink. He hired to a man who proved a hard master. He then came back to me, and after a few days I placed him with an Englishman upon a rented farm. He stayed faithfully by this kind employer a year; then he hired to another, where he was trusted to drive to town and transact business and one time he failed to return at the usual time. Two days passed, then his employer received a letter from him saying that he could not return; that he had fallen again and there was no hope for such as he, and that the farmer would find his team at a certain farmer shed. What, think you, did this farmer do, let him go? Indeed no; he sought him out and said: "John, come home with me. If you must fight such a temptation, why do it alone? Come and we will try to help you all we can." John came home, and for all I know to the contrary he is still at home at the old place. But this is only one instance out of a hundred. Lack of sympathy between employer and employee seems to be one great trouble.

One young man, a friendless foreigner (Russian), a thoroughly good, wholesome lad, came over to see me every Sunday. He complained that he was lonely, and I knew he craved the sympathy which I unstintedly gave. He said, in his broken English, that he was afraid to eat what he needed; that he knew his employer grudged him his food, and really from a full-blooded, red-faced fleshy boy, he grew or rather wasted to thinness, pallor and a half-frightened man, and fearing a breakdown I was compelled to place him with another farmer whom I knew to be exceptionally kind-hearted. The change was wonderful and in less than a month he was his own bright, jolly self again. All this goes to show that in the close and constant companionship of the farmer and his help, there must, of necessity, be much adjusting of things in general, but as the government has taken hold of this thing in earnest, with the efficient generalship of Governor Glynn, no doubt the good work may be made fairly successful; at least we will keep on hoping that it may.

MRS. F. W. COLE.

Coxsackie, N. Y.

Keeping Summer Boarders.

HUNDREDS of city people come to Dutchess County to spend their Summer vacation. The elevation is high, rising gradually from the Hudson; the highest point is reached at Stissing Mountain, 2,300 feet. The air is dry and healthful, water good, fruit plentiful, and many other attractions bring people here. There are some regular boarding houses, but many prefer the farmhouses.

Does it pay? This depends much on how much you have to hire or buy. I live on a large fruit farm and have taken boarders for 20 years. We do most of the work ourselves and raise fruit, vegetables, poultry, etc. Had there not been some financial benefit, I should have stopped long ago. It is not a get-rich-quick scheme or an easy job, but it gives a good home market for farm produce that you might otherwise not market at all.

While a good boarding place is largely "advertised by its loving friends," if one wishes to make it a business, it pays to advertise. Often it is better to have new people. One season with some guests, is enough. I have had guests from many stations in life; ministers, doctors, trained singers, newspaper men, etc., and I find that those who live the best at home, make the least trouble. In this as elsewhere "familiarity breeds contempt," and while one must be courteous to all, there is need of dignity that refuses to be "trodden on," self-control and an aptitude for meeting various phases of life—even hysterics.

I advertise good country board, and give it in the customary way. Breakfast at eight o'clock consists of fruit, cereals, eggs, milk, coffee and usually some sort of hot breakfast cakes; dinner at one o'clock and supper at six. I find it pays to give good fare and enough of it. It is astonishing how empty some of them are when they come. I know of no vegetable so universally liked as sweet corn. The people not only eat all they can, but carry quantities of it to the city. Some city people think all farmers are ignorant "jays," fit only to wait on them and furnish a mark for their wit (?).

One man who came here said he was surprised to find so much intelligence and refinement in the country. We did not tell him that we were surprised at his lack of them. Discreet silence is sometimes wisest. On the whole, taking Summer boarders has many pleasant features, wakes us up, and keeps us in touch with the busy city life.

New York. MRS. FLORENCE HOAG.

Know What It Costs.

MUCH has been said about figuring cost of farm products. There are so many things produced on the farm where the price is arbitrarily established by outside and hostile influences, that it is very important that the farmer should make a fair profit wherever possible. There are many cases where farmers and farmers' wives sell for less than cost of production through ignorance of the real cost. In a recent number of THE R. N.-Y., under the head of "Farm Manufactured Foods," are some very useful hints. Think, however, of the harm a woman with the idea that she could make pure fruit jellies at a cost of five cents a glass for a nine-ounce tumbler, might do in a neighborhood where others were trying to help out the family pocketbook by making jellies. We have made from 50 to 100 dozen each season, and we find that a scant seven-ounce glass costs at the farm 10 cents to produce. This is for crab-apple jelly. We sell to the stores in lots of two to six dozen at a time, and find that exclusive of transportation to town they net us about 30 cents a dozen when sold at $1.50 per dozen. We might just as well have got $1.80 a dozen, but foolishly let a neighbor have a few of our tumblers, not understanding that they were to sell any. The result was that they rushed about four dozen in to the local grocers and sold them at $1.50, thereby enabling them to be retailed for 15 cents each. They made rather a poor lot, but being in our tumblers and a small town they established a price which we had to follow. All they ever made was four dozen, but we had to sell several hundred dozen at the price thus established for us. Currant jelly cannot be retailed for less than 20 or 25 cents a glass and show any profit to the maker. Pint jars of piccalilli should net the maker at least 20 cents. We sell considerable quantities of cottage cheese, put up in half-pound packages that retail for 10 cents a package.

Bankers Lend Money Readily for Concrete Improvements

You can obtain money more easily for a concrete silo or other concrete structure than for any other purpose on the farm. Bankers want to increase the value and productiveness of farm land in their community. They know that concrete buildings are lasting improvements; mean greater efficiency on the farm; increase its value.

When you build, you want to get full value for your money. For all your concrete structures use

UNIVERSAL PORTLAND CEMENT

It is always dependable; even in quality, color and setting properties. Be sure to ask your dealer for "Universal."

Our booklets, "Concrete in the Barnyard," "Concrete Silos," or other information on concrete construction, free to farmers.

Hope Farm Notes

HOW ARE THE HOPE FARM SCRUBS?

VERY well, thank you. I used to know an old man who had one reply to questions about his health. "I am able to get from the bed to the stove." Our scrubs seem to be able to get from the nest to the feed box. They started at the tail end of the procession—now there are 12 pens behind them, and they still seem to be climbing. The following table shows what the 10 scrubs did during the 31 days of May:

May Egg-Laying Record.

BIRD	BREEDING	EGGS
No. 1	B. Rock	21
No. 2	W. Leghorn	22
No. 3	B. Rock	23
No. 4	Mongrel	21
No. 5	B. Rock	28
No. 6	Mongrel	25
No. 7	B. Rock	13
No. 8	Mongrel	19
No. 9	W. Leghorn	22
No. 10	W. Leghorn	19

There were also eight eggs laid outside the trap-nests. These cannot be credited to any individual bird, but they make the total for the month 221 eggs.

Now let those gentlemen who laughed so heartily, when I entered these scrubs, let themselves out for a final roar. There are in this contest 82 pens, or 820 birds; 13 pens of "Rocks" of Barred, White and Buff, 10 pens of Wyandottes, 18 pens of Reds, 34 of Leghorns and so on. I have the owners of these birds on record as valuing their pens at from $40 to $100. My scrubs cost a little less than $10. Now, only two pens of Rocks outlaid the scrubs during May. Here is another table carrying food for laughter:

Record for May (31 Days).

	EGGS.

Average All R. I. Reds	151
Silver Campine	215
Best W. Leghorn	258
Poorest W. Leghorn	106
Average W. Leghorn	220

Now gentlemen, all together, ha! ha! ha! How ridiculously funny these old scrubs or "culls" are. Out of 82 pens they actually stand No. 20 for May. They have beaten Tom Barron's Wyandottes and laid rings around every pen of Reds and Wyandottes in the contest. Out of 33 pens of White Leghorns only 16 beat them.

When it comes to individual records we have another laugh coming. No. 5 of the scrubs laid 28 eggs in 31 days. During the week following this performance she laid six more. Out of 820 birds only three beat No. 5 during May—two Barred Rocks and one Buff Leghorn. This bird was, and is, an undersized pullet with the Barred plumage. Judge Card scored her and gave 83 points! One of the best practical hen men I know told me in March that she would probably never lay an egg, since she was badly affected with "internal parasites"! It looks as if those parasites were eggs! The expert who picked her out of a crate of chickens in the live poultry market said she was a good one. She seemed so scrawny and inferior that I did not have the nerve to put her in the original pen, but sent her as a substitute. One of the original hens died and this one took her place. Thus I came near rejecting the cornerstone of the scrub record. Let us keep an eye on No. 5. No. 6 is still another good one. This bird seems to be a mixture of Red, Brown Leghorn and Wyandotte—just one of those calico birds you see running about the barnyard. The other mongrels show much the same mixture. No. 7 is something of a fizzle. Judge Card scored her at 87½, but her white ear lobes disqualify her as a B. Rock. She may come over yet with the eggs. At any rate this collection of birds has done far better than I ever expected and the end is not yet in sight. Remember, please, that they hardly began to lay before March 1. Some of those other pens were 250 ahead before the scrubs started. That was because my birds were not in good condition. They all had colds and most of them had been starved and mistreated and covered with vermin before we bought them. It required two months at least to get them fit. I have learned that half of the battle in these egg contests is having your birds in good condition, trained up to the day and all ready to start laying. Then they get going early and take a lead. On another trial I would buy pullets in September and train them carefully for two months at least. Of course these scrubs may peter out at any time now and quit laying. I am not bragging about them—simply giving their record. If they never lay another egg I shall find no fault, and I would make no estimate as to their final outcome. What they did in May however is now history. If they were purebred, now we might bank on their record, but for years we have been taught to believe that you cannot depend on a scrub. We will wait,

WHAT ABOUT IT?—I confess that I do not know. One man says it's the feed and care. He claims that a good feeder with scientific knowledge *"can make a wooden Indian lay eggs."* After this May record I am not much inclined to doubt it, but what about this? During this month of May, 11 of these pure blood birds never laid a single egg. I know that some of these zeros are held at $10 each. There were 63 that laid less than 10 eggs during the month. If it is a question of feed, what was the matter with these hens—some of them Leghorns? Then comes the old question of the possibility of selecting laying hens by their shape and appearance. Most poultry men hoot at any such suggestion about using a "system," but what about these scrubs—most of them selected in that way? I did not think it possible to tell from the looks of a hen how many eggs she will lay, but here are birds selected from about as inferior a lot as you can find anywhere! Stephen Francisco, the "certified milk" dairyman, says he can select a good dairy cow by looking at her face! Of course a man like Francisco who has studied thousands of cows comes to know a good one almost at a glance, but when you come to tell a cow's quality by looking her in the face you get it down to a fine point. Yet I think Mr. Francisco can come pretty close to doing it. I now believe that an expert hen man comes to know a laying hen by a sort of instinct, so that he can actually separate the workers from the drones. It seems evident to me that many very fine laying hens are sent to market and sold as meat because the owners are unable to detect them. Evidently some of the so-called experts do not know a laying hen when they meet her. We have evidence of that in the figures of this laying contest. There are a number of these 820 hens that have not yet laid an egg. Others have laid barely a dozen each—even with the care which has made my No. 5 shell out 34 eggs in 36 days! Again, I find that some of the pens have failed because two or three birds proved to be drones. The others are good but their mates fell down. Yet these birds all seem to be of much the same type. One would naturally expect that when a club representing a certain breed entered such a contest the birds would all be of a uniform and standard type, and much alike. Yet here is the May record for three such pens:

	EGGS.
American Buff Wyandotte Club	146
Nat'l Columbian Wyandotte Club	213
White Laced Cornish Club	128

One of these Buff Wyandottes laid 25 eggs while another gave only one. The Columbian Wyandottes varied from 10 to 26, and the Cornish from 0 to 16. Evidently no man can have much of a chance at an egg contest unless he knows how to select a uniform lot of hens without any misfits or drones. In one of the earlier contests a well-known hen man selected a uniform lot of birds as he supposed, but one of the best looking never laid an egg and this of course spoiled his record.

I find that several pens in this contest contain birds which have been bred from pedigreed stock. That is, the egg records of the mother and also of the grandmother on the male side are known. These pens stand well in total number of eggs, but the birds do not lay uniformly as one might expect them to do. It is evident that there are many things about a hen which the so-called wise men do not know. One of the pens of White Wyandottes at the Storrs contest is said to be made up of very high scoring birds very uniform by the "standard." This pen has a rather poor egg record, and while the hens are said to be very uniform in shape and plumage they vary greatly in performance. The most important thing I see about the egg business is for a man to devise some sure scheme for selecting layers, or else he will surely feed robbers and drones. No use talking trap-nest to the busy farmer—he cannot spend the time required to trap his hens.

I am going to find out what there is in egg pedigree in grading up hens. For example, take my No. 5 hen. Suppose I bred her to a cockerel whose mother had a record of 225 eggs in a year. That would be following the advice given dairymen to breed for milk or butter, but what proportion of improved pullets will I get, and how can I pick them out? Some of the experts say this is old—it has all been settled—but the records at these poultry contests tell us a different story. There are several pens valued at $100 or more. The eggs from such a pen would be valued at 50 cents or more each. Yet some of the birds, own sisters at that, may lay only half as many eggs as the others. The performance of my scrubs convinces me that it is possible to go into a flock of 50 hens and select 10 superior layers. I think poultry men, in order to succeed, must have something of this knowledge, for I believe that own sisters or half sisters in a flock of "improved" poultry will vary greatly in natural laying ability.

STRAWBERRIES.—Thus far this has been our best season. The Marshall demands an abundance of moisture. It is a large berry, and unless it can find water it will curl up. This Spring was wet, and the soil filled with moisture. The heavy mulch held this around the plants, and the berries have matured perfectly. They never were better. Some of them are quite as large as Astrachan apples and crimson red in color. Still, I cannot advise Marshall for general planting—in fact would not care to sell a large number of plants to anyone who expected great things from it. We keep on planting the variety because our trade demands it, and our soil seems just suited to it. Joe looks well this year and Chesapeake is an old-time favorite.

What would you recommend to sow for Summer pasture for cows during August, at this elevation (1,500 feet) and climate? How would rape do, and how much to the acre? When sown? I want something to help out my natural Summer pasture. A. O. C.
New York.

Rape will not do for a cow pasture. It gives the milk a "turnipy" taste. It is all right for hogs or beef cattle, but not for cows. I would not try to seed a pasture, but would prepare for soiling the cows. That means cutting green fodder and carrying it to the cattle. There is nothing better in most situations than corn fodder seeded thickly in drills. This makes a heavy crop. It can be cut and fed out in racks in the pasture or hauled to the barn. Japanese millet is another good one; also Soy beans. We usually depend on corn fodder, and it carries us through. H. W. C.

A Question of Land Title.

IN 1903 A sells a piece of woodland to B, who cuts the timber, but neglects to record his deed till 1908. In the meantime, A dies and his son (and executor), C, sells the same piece of land in 1907 to D, who promptly puts his warranty deed therefor on record. In 1914, when B wishes to sell, it is discovered that the same piece of land is on record as belonging to two different parties, B and D. D has paid taxes from 1907. What is the just solution of the tangle?
Massachusetts. H. H. P.

Every deed should be recorded as soon after it is executed as may be possible, and B should have had his deed recorded. D, not knowing that B held the title to the property, and being an innocent purchaser for value and having recorded his deed, is now the rightful owner of the property. Of course, A and his executor C have no right to benefit by the two sales of the same piece of property to different persons and B will have a right of action against C, as executor, for the damage he has sustained by the sale of his property. This takes for granted that D did not know of the sale of the land to B. M. D.

DAISY FLY KILLER placed anywhere, attracts and kills all flies. Neat, clean, ornamental, convenient, cheap. Lasts all season. Made of metal, can't spill or tip over; will not soil or injure anything. Guaranteed effective. Sold by dealers, or 6 sent by express prepaid for $1.

A READY—TO CULTIVATE
FARM
IN
GEORGIA'S COASTAL PLAIN

You have possibly read the report of U. S. Department of Agriculture on this section, termed "The South's Great Winter Garden."

A responsible concern desirous of building up the section in the most approved manner are offering "Rincon Farms" for sale—18 miles from Savannah, main line Seaboard Air Line Railway, allotments of 10 to 40 acres, each fenced, stumped, land ready to cultivate, new 5-room dwelling, barn and stable. Artesian water supply. Paved highway to Savannah. Norfolk loam soil, adapted to production of a wide range of marketable crops.

This plan presents a rare chance to those who want to start without large outlay of money. We will have agricultural experts accompany you to inspect the property. Think about this. It's an opportunity.

Ruralisms

Job's Tears.

I PURCHASED a packet of Job's tears, and there were no directions as to planting and culture. Will you give care and culture of same? J. R.
Oregon.

Job's tears, Coix Lacryma-Jobi, is an annual Asiatic grass quite closely related to Indian corn, and may be treated in the same way. It grows two to three feet high, and has a curious nodding inflorescence. It is ordinarily grown for ornament or curiosity, but some of the hill tribes of India use it for grain. The pearly grayish white beads are much used for necklaces and rosaries, and old-fashioned mothers believed these beads had great prophylactic value, enabling a child to cut teeth painlessly.

THE ROSE-CHAFER POISONS CHICKENS.

DURING the month of June, about the blossoming time of the grapevine and garden rose, a long-legged, sprawly beetle of a yellowish brown color, called the rose-chafer or "rose bug" suddenly makes its appearance, and begins to feed upon the blossoms and foliage of the

ROSE CHAFER.

grape, rose, apple, Spiræa, daisy and Deutzia, and a large number of fruit trees and ornamental shrubs. The insect is particularly injurious in New York, New Jersey, Delaware and the New England States. Some years these beetles come in vast numbers, doing great damage to the vineyard, orchard and garden; during other years, while their numbers are not nearly as great, they are sure to be found so numerous that the farmer should learn to recognize them as a menace not only to his trees and shrubs but *to his chickens.*

Three or four years ago a letter was sent to this Station by a New York State poultry raiser saying that they had lost over one hundred chickens and nearly as many ducklings by feeding on some insect. The insect turned out to be the rose-chafer, and the crops of the chickens were full of the beetles. As many as 42 beetles were found in a single crop. Other poultry raisers sent chickens to the Station with rose-chafers filling their crops, and we learned to recognize in these insects what many poultrymen have found a serious menace, for the chickens are attracted to these sprawly, creeping things, and like the boys with their bags of peanuts, they eat on and on until they can eat no more. If the chicken is less than seven weeks old it is usually dead in from 10 to 24 hours after such a meal. If it is alive, however, after the 24 hours are up the chicken gets well in a comparatively short time. Older chickens and old hens are seldom if ever killed by the insects.

The chief reasons that have been advanced as to how these insects cause the death of the chickens were as follows: "crop-bound," but the chickens that are "crop-bound" sometimes live over two weeks; this did not seem to be a good reason. Others said that the sharp spines on the legs of the beetles punctured the crop and killed the chickens, but careful post-mortem examinations gave no proof of this. Some thought that the beetles had fed on leaves that had been sprayed with arsenicals. Beetles were collected away from any sprayed trees soon after they had emerged from the ground, for they pass their larval or "grub stage" in the ground feeding on the roots of grasses, and these beetles were crushed and the juices of the insects mixed with water fed to chickens with a medicine dropper, and it was found that a little less than two teaspoonfuls of this extract would kill chicken after chicken in from 10 to 24 hours. About 60 chickens were killed to prove that rose-chafters are poisonous, and that the amount of poison making a fatal dose depends on the weight of the chicken. The heavier the chicken the more poison necessary to cause its death.

There is a danger in the use of many flowering shrubs in the yards for shade, particularly the grapevines. The rose-chafers stay from four to six weeks, and it is best to keep the chickens away from any of the plants that are attractive to the rose-chafers during the time when they are about. When the beetles are very abundant, the method that is most efficient is hand picking into a can of kerosene. The rose-chafer is very slow to be affected by poisons, and may do great damage, particularly to the blossom, leaves and vines of the grape, before it is killed by the arsenical spray, but within the last few years growers have found that they can successfully control these insects when they are not too numerous by using five pounds of the arsenate of lead and 12 pounds of glucose to a barrel of water. GEO. H. LAMSON, JR.
Connecticut Exp. Station.

The Flavor of Muskmelons.

I HAVE satisfied myself by experiments that if you plant muskmelons close to squash, cucumber or eggplant they do lose flavor. This is apropos to a letter I wrote to you last June. W. T. R.
Ridgefield, Conn.

Growing near eggplant has not commonly been assigned as a cause for loss of quality in muskmelons, though melons have long been thought to hybridize when occasion offers, with squash, cucumber and other related plants, the seedlings from the crosses being naturally of poor edible quality. This idea is widespread, but appears erroneous, as there are no authentic instances of hybrids between muskmelons and other cucurbitaceous plants, though opportunities for cross pollination are endless in nature, and many attempts have been made by investigators in various countries to produce hybrids by artificial means. The writer has made many careful pollinations of muskmelon blooms with cucumber, squash and gourd pollen, using every precaution to exclude other pollen, both in the field and greenhouse, but never secured hybrid fruits. It has been noticed that certain muskmelon types, such as the Casaba and related hard-rinded varieties, are apparently not capable of crossing with other forms, and as they have very largely perfect blooms containing both stigmas and pollen-bearing anthers they may be regarded as practically self-fertilizing. No matter how often the Casaba types are grown near ordinary muskmelons and other cucurbits they appear to preserve their identity. The writer has grown muskmelon selections inter-planted with cucumbers, squash, watermelon and sometimes gourds for 15 consecutive seasons, and has had no falling off in quality, but instead marked improvement over the originals, though there have been some changes of appearance in fruit and vines, probably owing to repeated cross-pollination between the varieties themselves.

There are several well-understood causes for variation of quality in muskmelons even if we exclude contamination with the pollen of related vine fruits, chief of which probably is poor seeds. Even if saved from fruits of the highest flavor we cannot always be certain that the pollen was not from a vine bearing fruits of low quality, if such are growing nearby. Other causes are starvation, over-stimulation from nitrogenous manures, injuries from storms, insects, over crowding, and very commonly in recent years, leaf destruction from the prevalent Alternaria blight, which appears promptly to check sugar formation and render the melons, even of the best varieties, flat and insipid in quality. Thus any factor interfering with the normal development of the plant and fruit may cause loss of flavor aside from the inherited influence of adverse pollen.

Just how the companionship of the egg plant, which is a member of the widely diverse family of the Solanaceæ, can affect the flavor of a muskmelon, is a mystery. Eggplants demand rich soil and high culture, and it may be that the crowding and over-fertilization of the nearby melon has much to do with the lack of quality. Give your muskmelons plenty of space, just enough fertilizer to give the vine a good start—about a shovelful of composted manure to the hill—maintain your "dust mulch" by frequent cultivation, spray for fungus diseases and keep free from insect and crowding vegetation and you will probably have well flavored fruits regardless of nearby squashes and cucumbers, provided your seeds were good to start with.
V.

Asters and Sweet Peas for the Flower Market.

CAN you tell me how to pack sweet peas and asters to ship to Philadelphia and New York City, also could you give us some idea of what price to expect during August and September for good stock? R. W. B.
Schuyler Co., N. Y.

Sweet peas for market are bunched, 12 stalks in a bunch, and six bunches tied together in a bundle. Good clear colors are demanded. Asters are tied in bunches, about a dozen flowers, or flower stalks of the lesser ones, in a bunch. All cut flowers should stand with stems in water, in a cold place, for some hours before shipping. These flowers are not ordinarily iced for shipment in Summer, though roses often require this precaution. The bunches are laid flat in boxes or baskets, paper lined, packed closely enough in regular ranks so that they will not shake about but not jammed so as to cause any bruising, tissue paper being laid over them, any "slack" over the stems of the last rows being taken up with wadded paper. Fine flowers that are being shipped long distances are often held in place by cleats over the stems.

It is quite impossible to tell what the prices may be in August and September. No other line of trade is so uncertain as the flower business. Returns are likely to be better from Asters than sweet peas, as there is quite a steady demand for them, and the up-State Asters are usually very good. They will travel in better condition for long distances, too. June 2 sweet peas, greenhouse grown, were quoted in New York at 10 to 25 cents per dozen bunches, Spencers 25 to 35 cents per dozen bunches. No Asters were quoted at that time. Some extra choice peas went higher than these general quotations.

A FRUIT-GROWERS' OUTING.

THE New York State Fruit Growers' Association is planning one of the most extensive and interesting Summer meetings ever undertaken by an Association of this kind. It is to be a combination of field meeting and pleasure trip. A special train is to leave Rochester at 1 p. m. on July 28th, stopping the first night at Saratoga Springs, there it would pick up a section from the Hudson Valley and the Eastern part of New York. The following day there will be a steamer trip the entire length of Lake George and a trip through Ausable Chasm, reaching Plattsburg for the night. The forenoon of Thursday, July 30th, will be spent on Lake Champlain, with stops at Grand Isle and on the Vermont shore. In the afternoon there will be an automobile trip through this famous orchard section of the Champlain Valley and in the evening a meeting of the Association. That night sleepers will be taken, and in the morning the members will find themselves at the Thousand Islands. Through the forenoon there will be a trip through the Islands and in the evening the company will return to Rochester. This promises to be a great undertaking. The trip is not limited to members of the Association, but their friends may also attend. The Secretary, E. C. Gillette of Penn Yan, N. Y., will upon application furnish full particulars of the trip—a statement of the expenses and all other details. We hope there will be a large attendance from the Eastern part of New York State as a strong discussion of the new apple law and the marketing problem in general will be a part of the program.

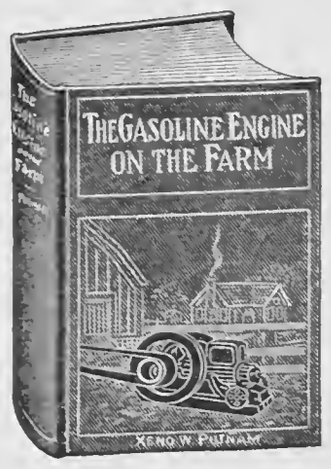
THE GASOLINE ENGINE ON THE FARM. Its operation, repair and uses. By Xeno W. Putnam.



This is the kind of a book every farmer will appreciate and every farm home ought to have. Includes selecting the most suitable engine for farm work, its most convenient and efficient installation, with chapters on troubles, their remedies, and how to avoid them. The care and management of the farm tractor in plowing, harrowing, harvesting and road grading are fully covered; also plain directions are given for handling the tractor on the road. 530 pages. Nearly 180 engravings.

This book will be sent to any address prepaid for

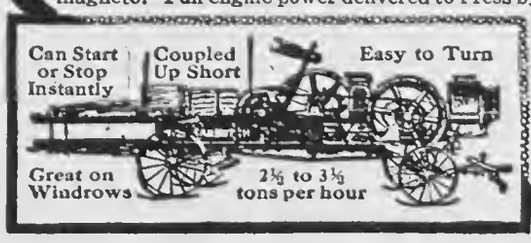
Big Tonnage! Big Profits!

No delays, sure, certain operation. These are yours with the fast working Sandwich Motor Press. Many owners make enough clear cash to pay for their outfits the first year—$200 to $300 clean profit each month. One Sandwich owner writes he baled "32 tons in 8 hours with a 3-man crew." Another how he averaged $18 to $22 per day after paying all expenses. These men can do this because they have the right press. 20 years experience built into it and special patented features found only on the Sandwich press—these are the reasons Sandwich owners make more money than others. The Sandwich way, the sure way.

SANDWICH Money Maker MOTOR PRESS has a hopper cooled gas engine mounted on same truck, 4, 6, 8 or 10 h. p., of more power than rated. Geared magneto. Full engine power delivered to Press by heavy steel roller chain. No power lost, no belts to slip or to delay. Simple self-feeder and the big feed opening just swallows the hay. Friction clutch right on press.



SANDWICH SOLID STEEL HAY PRESSES

Free Book! The Way to Win

Send a postal today for our free catalogue "*Tons Tell.*" It gives you reliable figures of the cost and profits of the hay baling; shows all the Sandwich Hay Presses, both motor, belt and horse power. Also ask for our special terms so you can buy your press from the profits made the first year. Write Quick. Address

Entered at New York Post Office as Second Class Matter.

Advertising rates, 60 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. We use every possible precaution and admit the advertising of reliable houses only. But to make doubly sure, we will make good any loss to paid subscribers sustained by trusting any deliberate swindler, irresponsible advertisers or misleading advertisements in our columns, and any such swindler will be publicly exposed. We are also often called upon to adjust differences or mistakes between our subscribers and honest, responsible houses, whether advertisers or not. We willingly use our good offices to this end, but such cases should not be confused with dishonest transactions. We protect subscribers against rogues, but we will not be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and to identify it, you should mention THE RURAL NEW-YORKER when writing the advertiser.

HERE is a new one from a poultry keeper—a woman at that:

It is recognized that hen people can't tell the exact truth about their fowls even if they try (and most of them don't try). There is something demoralizing about the hen game when it is entered into for big profits.

That may be one reason why the Hope Farm man keeps out of any "contest" where the flocks are kept on separate farms. He might have the utmost confidence in the other fellow too. But can anyone tell us why it is that sober and "esteemed" citizens become such blowhards whenever their hens do anything remarkable at egg-laying?

*

DURING the past few years the smaller types of gasoline engines have found a new use. They were once known as the metal hired man. Now we may also call them the tireless hired girl, for they have found their way into many a farm home to do much of the housework. Posted in some convenient place the tireless hired girl will run the washing machine and wringer, work the vacuum cleaner, play with the dishwasher and scrubber and do other hard jobs without complaining of headache or backache or demanding an "afternoon out." In some farmhouses these little engines have been harnessed to the housework with great ingenuity, and the work they do is even more remarkable than the barn work they have mastered. Many of our women readers are using the tireless hired girl. We would like to arrange with some of them to tell us what this "hired girl" does.

*

I HAVE always given you credit for any success I had, because of your criticism, given so that it encouraged instead of discouraged. C. E.

This note came like a memory out of the past. A young man was trying to write articles and to learn how to express himself clearly. The work was crude, but we thought we saw in it some evidence of power. All we did was to try to show this man that power without some polish would never take firm and lasting hold on the public mind. There are two sorts of criticism. One is destructive. It simply tears down by ridicule or denunciation, and makes no effort to build again on the ruin it has made. Another form of criticism is constructive, while it tears down what seems to be feeble or false it does not destroy the foundation, but suggests a better way to build the new edifice. We think all criticism should be constructive. If a man is not prepared to suggest a better plan than the one he seeks to destroy, he should wait until he can think out a substitute which can stand the test. The world would be far better off if the destructive critic were compelled to give a new and better way before opening his mouth to eat up the old one.

*

WE would call the attention of our women readers to the hen announcement on page 861. The egg-laying contests have already accomplished great things for the poultry industry, and they are sure to do more by helping to establish strains or families of hens which show superior laying power. Since our experience with the "scrubs" we have become convinced that there are to be found, on some of our farms, flocks of very superior poultry. Many of these have been developed by farmers' wives and daughters, who, without claiming to be expert breeders, have produced very superior stock. Now the egg-laying contests offer a method of testing such flocks in a way which no one can criticize. A record made at such a contest will stand unchallenged. These farm women cannot be expected to go to the expense of entering a full pen of birds, and so we will try to do it for them. Our plan is to enter one or more pens—made up of single hens or pullets from a number of different flocks. A woman who wishes to compete will notify us, stating the breed she keeps and a brief history of her flock. We wish, if possible, to confine this contest to women who are not what one may call poultry "experts," "authorities" or advertisers—but those who keep plain farm flocks of good quality. Such women will simply select their favorite hen, send her on at the proper time and we will do the rest. We shall have an article from Mrs. Tom Barron telling how to select the best hen and other articles from Mrs. Woodruff, Mrs. Haynes, Mrs. Cosgrove and others on training and fitting a hen for the contest. THE R. N.-Y. would like to prove that some of these farm flocks are superior layers, and our women readers can help do it and also help themselves into a good business if their hens can make a record. We would like to hear at once from women who wish to test a favorite hen.

*

A COMPANY of rich "sports" came from England to play polo. They brought a herd of fast ponies and an expensive lay-ont for knocking a ball about a field. A company of even richer American sports mounted their ponies and the game was on. Some 50,000 people paid to see these rich playthings of nobility and bank accounts try to hit that ball, while the daily papers printed page after page—for it was a great "society" event. The Englishmen hit the ball harder and straighter, and so England won. Not one American in half a million will ever play polo, and not one of us in 100,000 know what the game is, but it was a "glorious victory" for England—because the papers say so. In truth it was a useless performance which adds nothing to the wealth or comfort of the world; a rich man's idle sport which adds nothing to useful knowledge. Strange how in all departments of life the "fancy" is applauded while utility is ignored. On July 4 another Englishman will start for this country. He is a quiet, useful man who in his line is a master far more deserving of the nation's applause than any nobleman who ever punched a polo pony. This man is Tom Barron, the poultry "wizard," the man who has so gained the confidence of a hen that she has told him more of her secrets than other humans have learned. The man with the useless racehorse or polo pony comes across the Atlantic with bands playing and flags flying. Tom Barron comes unannounced and unrecognized. Yet what Barron has done for poultry will be worth to this nation 100 times as much as all the racehorses and "sports" who ever left England.

*

AT this season we are interested in reading the "baccalaureate" sermons which are preached at the colleges and universities. These sermons are supposed to be the last word of advice to young men and women who, while trained for command, have as yet no company of soldiers to lead. One of the best of these baccalaureate thoughts for this year we find in the sermon by President Hadley of Yale from this text:

"Covet earnestly the best gifts; and yet shew I unto you a more excellent way."

President Hadley spoke on what he called a fair measure of success.

Many a man of 50 whom the world counts successful is in his heart soured and disappointed—unnecessarily soured and disappointed—because at the age of 30 he shut his eyes to the other kinds of success which life had to offer besides professional distinction.

No doubt you can, within the limits of your acquaintance, name a dozen men of whom this may be said. At an age when a man should be mellow and cheerful and wise these men are sour and disappointed because they have lived one-sided lives and cut out sentiment, poetry and the humor of genuine human nature in their rush for the material things of life. We think the world is coming now to view such men with a clearer understanding of what their lives really mean, and why they are sour and unhappy, and that knowledge is one of the most hopeful indications of the future. For many years there ran all through books and lectures and sermons the thought or suggestion that the rich and "strong" man presented the ideal or model for college youth. No one can estimate the moral injury which this false idea has wrought in our public life. The reaction now seems to have set in when young men and women are directed to the sour and disappointed life of the "merchant prince" or the master of finance. As we write it occurs to us to name one man who has given us all a shining example of how to live a broad and consecrated life. That is Brother Barnabas, the head of the Lincolndale school. Here is a man strong and capable enough to have made his way into a high position in finance or business, who has chosen to employ his strength of character and great powers of organization in manufacturing manhood out of material which may have been thrown out and rejected by the social machinery which the captains of industry have built up. This is said to be a dull, prosaic age in which money is made a god, yet it is a hopeful age, with a world of good in it, when there are to be found men like Brother Barnabas and the thousands of men and women who in quiet and humble ways have "chosen that better part" of giving their lives that children may have a chance.

*

PRESIDENT WILSON is reported as saying that the present talk about hard times or fear of the business future is due to psychological influences. We have heard one learned gentleman go a little further and claim that what the President really meant to say was epistemological idealism! Another unlearned friend said these wise men got him out over his head but he understood the President to mean that the American people have been "seeing things at night"—thinking times ought to be "hard" and thus making them so. All the thinkers seem to agree that if our farmers would only feel contented and look for good times, prosperity would surely appear. For instance, President Wilson claims that there is a plot to delay the passage through Congress of what are known as the "trust" bills to regulate big business. In proof he publishes two letters which show that manufacturers and railroad men are trying to induce citizens to write Congressmen urging them to adjourn and let the present laws rest. One of those letters is from a St. Louis manufacturer who gives three reasons for the "psychological" trouble.

The first crop—Winter wheat—is unusually promising. A bumper crop is almost assured beyond any question of doubt—the harvesting of which has already begun in Oklahoma, and will be in full sway in Kansas within a week. The gathering of this crop, when finished, will be an inspiration and encouragement to the whole country. We are very anxious to take full benefit of that inspiration and help to accelerate this forward movement of better conditions.

You see these men all come back to the dear old farmer for their salvation. In time of war he must furnish food and soldiers and pay the largest share of war taxes. In time of peace he must keep up the vitality of the city, feed the nation and give prosperity by selling at what he can get and buying at what the other fellow charges. When it comes to a national attack of epistemological idealism he is expected to produce a bumper crop and give "inspiration and encouragement." The bankers and manufacturers and railroads with all their money and power confess their inability to induce the nation to "cheer up." They all go to the man in boots and overalls whose bumper crop will make everyone better off except himself. We notice that with every new favorable report the price of wheat drops while bread and flour remain the same as before! Now if these monied gentlemen want to give the nation real prosperity why do they not work together to give the farmer a fairer share of what his wheat finally brings? President Wilson quotes from another letter written by a newspaper publisher:

The granting of the petition of the Eastern railroads for a five per cent. freight increase will do more for the prosperity and development of the country than all legislation against unlawful restraint and monopolies.

The railroads are to haul 15 per cent. more wheat than last year and be paid five per cent. more per bushel for doing it while the farmers are to be paid 15 per cent. less per bushel as a penalty for producing a bumper crop! Suppose the farmers instead of the railroads were to receive a five per cent. increase! Every dollar of such increase would be spent promptly for manufactured articles which would start the factories and give employment to workmen. There would be nothing "psychological" about that but the hardest kind of business sense.

BREVITIES.

YOU may be entertaining an angel unawares among your pullets. The Hope Farm man's scrub which laid 34 eggs in 36 days is a discard—sold at about seven cents a pound.

The letter from Mexico on page 852, gives a little idea of the way THE R. N.-Y. family is scattered over the world. No matter where they go or where they live our people are glad to see the paper and glad to help it when they can.

THE Kansas Agricultural College has gone to prison. This means that 95 prisoners in the Federal prison at Fort Leavenworth are taking correspondence courses in agriculture. Let's hope these men will be educated into the true freedom of the farm.

Now the mathematicians are after the housefly. The latest figures from the Wisconsin Agricultural College: "Depending chiefly on the climate, there may be from eight to 14 broods a season, and the progeny of a single female fly, provided they all live, will be 14,067,792,000,000,000." Perhaps Tom Barron has been able to introduce the blood of a laying strain of flies into his Wyandottes!

WOMAN AND HOME

The Patent Churn

How the Agent Was Worked

By Enoch J. Mills

MRS. HAYS was busy with the Monday washing when there came a vigorous knock at the kitchen door. Opening it she faced a well-dressed man, who began talking before she could speak.

"Madam, I'm introducing the great, new, roller-bearing pedal-rocking pat-

A WELL-DRESSED MAN WHO BEGAN TALKING.

ented Royal churn. It works so easy that you don't realize you're working at all. Children quarrel for the fun of churning with it. It makes good butter with all the bother left out. It's sure, absolutely sure—cannot fail; no guessing and no failures with it. Saves over an hour's time every churning and that's about three hours a week—a day every month and nearly two weeks in a year. One week of your valuable time, lady, will pay for the churn; the other week will be your sensible profit."

The man had talked himself out of breath, and Mrs. Hays was speechless through sheer surprise at his volubility. She slowly shook her head; as that form of answer meant more just then than any other she could think of.

"No, no, madam; don't shake your head. You cannot understand what this wonderful new churn means to you poor, tired, over-worked women."

Mrs. Hays tried to speak; held up her hand in distress but the agent talked smoothly on, edging slowly inside the door under cover of his gatling gun conversation. The disorder of the room caught his eye, and he understood the disadvantages of trying to sell anything to a woman when her house is all torn up. Craftily he dropped the churn subject, and turned his attention to the clothes-wringer, which he manipulated skillfully for half an hour.

After he dropped the churn matter Mrs. Hays found him quite pleasant; occasionally he gave a hint about how hard ordinary things ran nowadays and compared them with the easy running Royal churn. While Mrs. Hays busied herself with getting dinner, the agent hung out the clothes, emptied the suds and put away the tubs. Meantime Mr. Hays came in from the field. He found the agent's fund of witty stories quite refreshing—though many of them brought in the new churn and how folks were afraid to take hold of anything new. Near the end of dinner Mrs. Hays admitted that she had the cream saved from Saturday to Monday, and that she had intended to churn it that evening after supper.

Again the agent became useful. This time he was even more at home. With a dairy thermometer he tested the cream, added hot water to bring it up to the proper temperature for churning, worked deftly and kept up a running fire of talk about the wonderful churn at the same time.

"See now; didn't I tell you it was simple? Just three minutes since you brought up the cream and I'm all ready to churn it. Do you mind if I look at this book a few minutes?" Mrs. Hays was surprised that he would stop talking long enough to look at anything, but she gladly gave her consent to his request. Settling himself in a comfortable pose the agent seemed lost in the book. With scarcely a glance at the churn he became absorbed in reading. With one foot he rocked the churn easily by means of the patent pedal arrangement. Through the little glass window at the top of the churn the butter grains showed clearly, and the glass cleared from milk white to a watery color. Mrs. Hays timidly called the agent's attention to the butter.

"What, so soon as all that?" he asked surprised. "Why I'd hardly got started reading. What time did you say it was when I began?" Mrs. Hays admitted that he had been but 11 minutes. At this the agent looked a bit disappointed. "Usually I churn in eight or nine," he said. "But then I got interested in the book and forgot my business." Through a patent, screened drain the agent drew off the buttermilk, leaving the butter collected in conspicuous grains, soft and yellow.

Washing the butter was a simple process, duly explained, because the screen let the water out and kept the butter in. After the washing the butter was ladled into a big wooden bowl and left on the table for working down and salting. The agent carried the churn to the waiting spring wagon by the gate and returned with some papers in his hand.

"Just sign here, Mrs. Hays, will you please." It was more of a command than a request. His tone was full of confidence. Mrs. Hays wiped her hands carefully on her apron and took the paper.

"Sign?" she asked. "What for?"

The agent was hurt. He showed it by his look.

"Most folks," he explained, "are willing to put their names down when they want anything."

"But we don't want anything," she protested, and there was a twinkle in her eyes.

"But madam—the churn, it is a great privilege I'm offering you. Not everyone will have the opportunity of getting one; the factory is nearly a year behind in its orders now. Only yesterday I got a letter from the manager saying that after this week we'd take no more orders for six months or so." He searched in vain for this letter. When he looked up Mrs. Hays was smiling understandingly.

"Now, Mrs. Hays, I don't want you behind times and have your neighbors talking about you. Just to show you that I'm sincere in the matter—" he lowered his voice and looked around, "I'm going to write the manager that you folks have been kind to me and ask him to ship you a churn freight paid; so that way it'll cost you only eight forty-five instead of what the others pay. I'll ask him to pick out the churn himself and you'll be sure to get a good one—not but what they're all good, but you know, sometimes, one's a wee bit better than the rest."

"Will next week be time enough for delivery?" Mrs. Hays shook her head decisively. "Then I'll wire the manager to ship yours right away by express, as a special favor to me."

"I guess we'll wait until the factory isn't so rushed," said Mrs. Hays and she entered the kitchen, quickly closing the door behind her.

"OFF CAME THE CHURN LID."

For a moment the agent looked disappointedly at the closed door. Then he glanced at his watch as though suddenly remembering something of importance, and drove hastily down the road.

Late Tuesday evening, just as Mrs. Hays was serving some invited neighbors supper on the lawn, the agent stopped at the gate. "I beg a thousand pardons, ladies and gentlemen, for interrupting, but my horse has gone lame and give clear out. I haven't the heart to drive him into town tonight. Thought maybe you folks would keep me overnight."

The agent's horse was truly lame; Mrs. Hays had noticed that the day before. Besides they were accommodating neighbors, and rarely refused anything reasonable to anyone.

Mr. Hays rose from the table. "Drive around to the barn," he called, "and I'll help put up your horse." Meekly the agent bowed and turned his tired horse in at the gate. Two of the neighbor men followed to the barn. From them the agent learned that it was the Hays' fifteenth wedding anniversary that was being celebrated by the supper. Further he learned that the neighbors had presented Mr. and Mrs. Hays a set of water glasses and a pitcher to match.

The agent was visibly disappointed. "What," said he, "give such fine folks a small thing like that?" The neighbors had not thought of it in that way and really felt a bit queer. "Why not all of us chip in and get them something handsome?" He was confidential now. Mr. Hays was just inside the barn and might hear. Cleverly he manipulated the conversation so that each neighbor was afraid to offer an objection for fear of being placed in the light of being opposed to giving his neighbors a decent present. "I'll throw off my profit on it—" Here one of the men interrupted to ask what it was they were to give. The agent told them in low tones. From the back kitchen window Mrs. Hays had watched the agent talking to her neighbors, and from their actions she suspected what was being said.

The agent was delighted. On the way to the house he suggested that he would show off the churn to the company. Then, when the proper climax came, one of the neighbors was to rise and present the churn. The agent planned it all. The two neighbors were ominously silent. The company seated themselves at the table out in the yard, the agent modestly refusing to sit down with them. Said he had something he wanted to show them.

Mrs. Hays had gone into the kitchen for the last of the hot things for the table before sitting down herself. At the door the agent met her and said something in an undertone. Mrs. Hays listened and when he had finished, she nodded.

The churn was placed where it would show to advantage a few feet from the table, and the agent carried the big jar from the cellar with a flourish. To anyone who would listen he explained the workings of the churn as he prepared the cream. Making sure of the temperature and testing the lid to see that it was down tight, he drew out of his pocket a worn paper, hitched forward an abandoned rocking chair and settled himself in a very unconcerned pose. He looked as much at ease as though churning was the most delightful thing in all the world.

Mrs. Hays whispered something to the neighbor who sat next her at the table. The man smothered a laugh and glanced quickly toward the agent, who sat calmly rocking and reading, and pedaling steadily away. Ten, 15, 20 minutes passed. A half hour. Still the agent was apparently absorbed in his paper. Frequently he cast furtive glances at the churn but never once lowered the paper.

"Say, Mr. Churn man," drawled the neighbor who sat next Mrs. Hays, "how long does it take that new fangled churn to do business, anyhow?" The agent looked up surprised.

Glancing at his watch the agent laughed outright. "You're right," he laughed, "I got interested in the paper and forgot all about the temperature."

Wiping off the thermometer he looked at it critically: "Just what I thought," he announced. "Temperature's gone way up while I been reading."

Cold water brought down the temperature and the agent again started churning. The company was near finishing the

HE URGED THE HORSE TO A FASTER PACE.

meal so the agent left off reading and devoted himself to the churn. Ten minutes, and he glanced appealingly toward Mrs. Hays, but she was busily talking. Another five minutes passed and the company arose.

"Come see my flower bed," invited Mrs. Hays and the company filed out of sight around the corner of the house; much

(*Concluded on page 867.*)

Dr. Eliot's Three Poems.

SOME years ago Dr. Charles W. Eliot, formerly president of Harvard University, declared that he could select 50 volumes which would contain the foundation for a liberal education. These volumes are known as a five-foot library. While Dr. Eliot's selections have been criticised by many, he has certainly gathered a wonderful store of the world's best literature. More recently Dr. Eliot stated that every American child should commit at least three poems to memory. These are Longfellow's "The Village Blacksmith," Hunt's "Abou Ben Adhem," and Bryant's "To a Waterfowl." Fifty to 60 years ago it would have been a rather strange child, in New England, who could not recite the first two poems. They were printed in every school reader, and who among the old boys and girls from the country school districts has not recited one or both of them? Bryant's poem is not so well known, yet it is the best of the three.

* * *

To a Waterfowl.

Whither, midst falling dew,
While glow the heavens with the last steps of day,
Far, through their rosy depths, dost thou pursue
Thy solitary way?

Vainly the fowler's eye
Might mark thy distant flight to do thee wrong,
As, darkly seen against the crimson sky,
Thy figure floats along.

Seek'st thou the plashy brink
Of weedy lake, or marge of river wide,
Or where the rocking billows rise and sink
On the chafed ocean-side?

There is a power whose care
Teaches thy way along that pathless coast—
The desert and illimitable air—
Lone wandering, but not lost.

All day thy wings have fanned,
At that far height, the cold, thin atmosphere,
Yet stoop not, weary, to the welcome land,
Though the dark night is near.

And soon that toil shall end;
Soon shalt thou find a Summer home, and rest,
And scream among thy fellows; reeds shall bend,
Soon o'er thy sheltered nest.

Thou'rt gone, the abyss of heaven
Hath swallowed up thy form; yet, on my heart
Deeply has sunk the lesson thou hast given,
And shall not soon depart.

He who, from zone to zone,
Guides through the boundless sky thy certain flight,
In the long way that I must tread alone,
Will lead my steps aright.

—Wm. Cullen Bryant.

Very Valuable Property.

(Reprinted By Request.)

I ain't no hand to brag my children up
Above all others, but I'll tell you now,
That little girl of ours does win the cup—
In my own estimation, anyhow.
I'll guarantee a dozen folks have said,
"She looks jest like her mother"—don't it please
My wife to have 'em say so? She gits red
As fire, her heart's so full she has to sneeze.
An' smart? Why I'll bring folks to guarantee
They never saw her beat—I've heard 'em say
In *that* respect she sorter favors *me*.
Her smartness 'pears to trace right back, my way.
She don't weigh over 30 pounds, and yet,
Her little fist can pound away our care.
You bring a million dollars and I'll bet
That you can't buy that baby's smallest hair.

The Old Man.

Walt Mason.

Be kind to your daddy, O gamboling youth; his feet are now sluggish and cold; intent on your pleasures, you don't see the truth, which is that your dad's growing old. Ah, once he could whip forty bushels of snakes, but now he is spavined and lame; his joints are all rusty and tortured with aches, and weary and worn is his frame. He toiled and he slaved like a government mule to see that his kids had a chance; he fed them and clothed them and sent them to school, rejoiced when he marked their advance. The landscape is moist with the billows of sweat he cheerfully shed as he toiled, to bring up his children and keep out of debt, and see that the home kettle boiled. He dressed in old duds that his Mary and Jake might bloom like the roses in June, and oft when you swallowed your porterhouse steak, your daddy was chewing a prune. And now that he's worn by his burden of care, just show you are worth all he did; look out for his comfort, and hand him his chair, and hang up his slicker and lid.

A GROUP of young men were seated in a Western restaurant discussing ways of spending their vacation. One of them said, "I am going home to see the old folks. Father is getting a little old, he has worked hard, and may not be here long. I shall probably work while I am there, but that seems the best way to spend my vacation this year." A middle-aged man at the next table turned to the group of young men.

"I want to congratulate you," he said. "You are right. I went back last year where the old folks lived. They were both dead, but I fixed up the lot in the cemetery and paid to have it kept neat and tasty."

"That was all right," said the younger man, "but what did you do for them *before* they died?"

The older man looked at him for a moment, then he choked, pushed his food away, paid his bill and walked out of the restaurant without a word. Through all his days he will be haunted by the thought that he neglected the old people while they lived and while they needed him. It is an awful thought to haunt and chase a man throughout his life. There are rich men today who would give their gold if they could get away from it. In this great, busy, rushing world young people with life all ahead of them cannot always realize what it means to the old folks to see their busy children grow away from them. "Remember thy father and thy mother."

* * *

ALL sorts of "remedies" for the tramp hen have been suggested. These run from shooting the hen and fighting her owner to letting her alone to tear up your garden at will. Here is a new one. This means going by night into your neighbor's yard and scattering buckwheat and corn in his flower or kitchen garden. His hens will do the rest. Instead of coming upon your premises they will "follow the grain" and before the owner wakes up they will have his garden in great shape. Then his wife will enter the argument and the hens will be shut up.

* * *

LAST month a correspondent suggested advertising for teachers in the hope of obtaining a wider list to select from. The object of advertising is to enlarge the circle of people who know your wants or your offerings. Whether a man puts up a shingle in front of his farm or buys space in some expensive magazine the object is the same, whether he wants a teacher, a hired man, a horse or a piano.

* * *

YOUR writers on medical topics are orthodix, though orthodoxy is out of fashion, and, what is better, show common sense. Occasionally some one of your estimable correspondents gets worked up over the dangers of damp sheets, which no human being ever gets between if he can possibly help it, and attributes the origin of our infectious colds to that or some similar unessential or merely contributory factor. A knowledge of the infectiousness of common, and uncommon, colds, of their serious consequences and of the importance of as much quarantining of infected persons as possible, is a thing of vast importance to our welfare both in town and country. Infections, intemperance in eating and drinking, narcotics and stimulants, these are the ever present devils that assail us. We can tuck our heads under our wings like the birds and breathe CO2, limit our bathing to accidental plunges into the lake, and shiver in settles before a green wood fire, but if we keep the infections and the non-living poisons out of our insides we shall stand better chances of living out our alloted spans. W. E. D.

* * *

THE Canadian Farm has been conducting a discussion on "Do Women Influence Men to Leave the Farm?" All sides of the matter are being discussed, but here is one hopeful note:

I have failed to notice a case where a woman induced a man to leave the farm, against his will, but I do know of several cases where the wife has kept the husband on the farm. For most women love the freedom of the country life, where we can give our children plenty of plain, wholesome food and they can see the beauties of nature.

The writer of this says that on too many farms grandfather would come back and find himself unable to handle the labor-saving devices which the farmer now employs. Grandmother would come back and find herself entirely at home with the fixtures found in the kitchen! That was a good article last month from the woman who sat down and talked this matter over with her husband. See page 777.

THE BEGINNING OF FARM BOOKKEEPING.

* * *

MRS. HELENE C. LOVEJOY, a woman who confesses to 50 years, has just completed the four years' course in horticulture at the Ohio Agricultural College. Mrs. Lovejoy graduated from the College of Arts in 1884, but came back to complete the horticultural course. In addition to her school work Mrs. Lovejoy kept house for a family of three.

* * *

THE girls of Gamma Pi Gamma, the honorary society at the Kansas Agricultural College, excludes all "flunkers." No person who has ever failed in a college study can belong to this society, which is confined to girls taking home economics. What housekeepers such girls ought to make!

* * *

LESLIE'S WEEKLY gives an article by a woman who instead of "living to eat" learned "eating to live." She brought her family within sight of debt by extravagant housekeeping and then saved the home through economical buying and saving. When she started to reform she says:

Again I turned to my cook books and magazines, this time in the search for hints on economy. I must admit that they were disappointing. I am convinced, by my own experience, that a great deal of the extravagance of our American housewives is chargeable to the women's magazines, which delight in stimulating every form of gastronomic extravagance. They delude the eye with pictures of extravagantly spread tables, excite the curiosity with recipes for strange and costly dishes, and when they pretend to teach economy, usually lead us into dreary wastes of tasteless and nutritionless menus. The housewife who would see her family well fed on the minimum expenditure must use her own common sense.

There is no question about the need of common sense. We have often thought we would like to locate some of the good ladies who prepare the wonderful food described in these magazines right in a farm kitchen, say when the thrashers were coming.

* * *

THE age of the cold storage egg is a favorite subject for jokes when the city imagination grows stale. This one will appear in time:

New York woman is suing for divorce because her husband wrote to a girl whose name he found on an egg. Foolish jealousy. The girl's a grandmother by this time.

Some of the "fresh-laid eggs" which city people eat are certainly old enough to have produced grandchildren. It would require only seven months or so for a Leghorn egg to fill that part of the programme. As for the girl, she would be foolish to trust her name with an egg until it was made into cake.

* * *

BROOKLYN, N. Y., has a Domestic Relations Court in which cases of "trouble in the family" are tried. The judges decided to learn, if they could, the underlying causes which led to these domestic troubles. They carefully investigated 750 cases and made the following report:

Cause.	*Number.*	*Per Cent.*
Drink	390	45.8
Other women	117	13.7
Laziness	79	9.2
Jealousy	76	8.9
Incompatibility	75	8.8
Gambling	33	3.8
Out of work	30	3.5
Lazy and untidy wives	20	2.3
Mother-in-law interference	12	1.4
Other men (accusations of husbands)	10	1.2
Cruel treatment	8	.9

Thus we see that drink and laziness are responsible for more than half these domestic troubles, while lazy wives were responsible for only a little more than two per cent. of the cases. And what becomes of the sad old joke about mother-in-law? On this showing there are nearly seven lazy husbands, 39 drunkards and 10 "other women," to one interfering mother-in-law. The fact is that this last-named character has long been used as a scarecrow or joke when in most cases she is a friend in need.

* * *

GO TO SCHOOL.—Elementary instruction is obligatory with a very large O in France. If a child absents itself from school four times a month, the father or guardian or person responsible for the child may be summoned to appear before a municipal school committee. If the party in question fails to put in an appearance, his or her name is posted at the entrance of the City Hall for a fortnight, together with the reasons for the summons. Upon a second offense the offending party may be brought before a justice of peace, and if satisfactory reasons are not assigned, he may be subjected to a fine of from 11 to 15 francs ($2.12 to $2.90) or to imprisonment from one to five days. If the child is insubordinate or refractory the father or other responsible party may call in the services of a constable

* * *

WE NEED "EDUCATION."—Last Summer a young man with a family of little folks, living on a rented farm, became ill. He cried unceasingly at first because of the inroads that must be made on the little sum he was saving up to buy a farm. Knowing by experience something of the difficulties that beset these men, perhaps my observations and conclusions may have some value. Drainage is at the bottom of most farming operations in this section. Alas, it is not at the bottom of much of the land; it has yet to be put there. Once there it is only the first step in the building up of run down land. We do not expect a man to win his L. L. D. and support himself and family at the same time, all without capital. Yet because a man fails to give his farm an L. L. D. and support a family with little or no capital, it is assumed by some that he needs educating. A year or so ago two countrymen at the State Fair were attracted by a placard. "Black Rot of The Grape." Pausing a moment, one of them said: "What is the use? If I found out what to do I couldn't do it." The weary-looking expert in charge said: "It is simple enough." As the women passed on the grape lover said: "Simple enough! To fight the black rot would take mind, muscle and money. It might be simple enough to furnish the mind, but the muscle and the money—that part is not simple." J. F. C.

"Short Stories"

All Sorts of Personal Experience With Food, Friends and Fixtures

Water Supply for Church.

WILL you help in solving the problem of water supply for a country church? There is a cemetery on the property, which makes a dug well out of the question, and an inside cistern has proved objectionable. Another feature of the problem is the infrequent use of the water; it being seldom used oftener than once a month, at times of social gatherings. Would a drilled well, or an outside cistern, sunken into the ground to keep from frost and a filter be advisable under the above conditions? If so, which would be preferable? If the cistern and filter, what would be the approximate cost? E. W. A.

New York.

This is a problem about which it is difficult to give specific advice without detailed knowledge of the surroundings. Owing to the infrequent and only partial use of a cistern supply, whether filtered or not, such a supply could hardly help but become stale and unpalatable, if not really unwholesome. It is very much more difficult, also, to prevent water stored in underground cisterns from becoming polluted than is generally supposed. Leaky walls and pervious covers are the rule rather than the exception.

A little investigation might discover a spring of sufficient capacity for the needs of a church, and available for its use, but, failing this, a well would have to be resorted to, and there are probably few country churches where a well may not safely be used. The depth at which water may be found, and the ease with which wells may be dug, drilled, or driven, vary, of course, with the locality, but neighboring wells will usually give some clue to these points. Shallow wells are comparatively liable to pollution, but deep wells—50 to 100 feet in depth—are usually safe, especially if a stratum of clay has been pierced. It is possible that a well may be driven at such a height above, or such a distance from, the cemetery upon this property as to render the presence of the cemetery a negligible factor, and, in my opinion the danger of pollution from this source is liable to be overestimated. A greater one, and one which should be guarded against, is having a privy vault in such position that surface or underground drainage from it might be carried into the well. The only suggestion that I feel able to make, at this distance, is that, if a flowing spring be not available, a deep well be drilled or driven, if possible, where the contour of the surface indicates that the underground flow is away from it and toward the cemetery; and further, that no privy be located where any part of its contents may be carried to the well by natural drainage or by the flushing of the ground from melting snows and heavy rains.

M. B. D.

NEXT TO GODLINESS.—Isn't this true story the limit for keeping a house clean? Miss Margaret is Uncle G.'s housekeeper. She is from the provinces, and a dear and valued friend of the whole family. One Summer, not long ago, she took a long vacation and visited an old school friend in New Brunswick. This friend was the last of her family and lived alone, having just property enough to live on and nothing to do but keep her house clean. Always the first thing in the morning she went over the kitchen and dining-room floor carefully with a dry mop, to see if by any chance there might be a hair anywhere. She wouldn't enter her house from outside at any time, or let Miss Margaret, without shaking her skirts. And on Monday afternoon she calmly laid her clothes on the kitchen floor to sprinkle them. In response to Miss Margaret's look of surprise, her friend said calmly: "I always do." K.

USE FOR "SOAP WEED."—Years ago I worked on a dairy ranch in Colorado. The cows fed on the range and during the season there was great complaint about the "soapy" taste to the milk. This was due to eating soapweed or Spanish bayonet. It was a great nuisance, but has now become an article of commerce. The Colorado Experiment Station tells how it is gathered and used for the manufacture of soap: All parts of the plant are utilized, both tops and roots. In Western Kansas manufacturers are paying $8 a ton for the plant baled and delivered at the railway station. The estimated cost of cutting, drying, baling, and hauling the material is $5 to $6. This gives a fair margin as wages, and, at the same time, encourages the eradication of this weed. The weed is usually allowed to dry two or three months after cutting. It is then baled by means of the broom corn baling machine.

STORING WINTER CLOTHES.—Miss Anabel Turner, instructor of home economics at Wisconsin University, tells how to put the Winter clothing away: "The prime requisites in putting away Winter clothes are: thorough brushing and cleansing; exposure to the air and bright sunlight for several hours; and tightly closing the bags in which they are placed. Sunshine is one of the best disinfectants known; direct sunlight has caused the death of many a germ and moth egg. If the clothes are well brushed and cleaned, with due attention to pockets and seams, then well exposed to bright sunlight, and tied up tightly in cotton bags, you may feel safe about them until the cold days bring them out again. Cedar chips may be put in the bags, but this is not necessary. Newspapers or tar paper may be used instead of cotton bags, but care must be taken to have the packages tightly sealed. Moth balls are undoubtedly effective, but the odor is disagreeable; camphor gum too is good, and not so disagreeable. In the case of clothing that will be needed occasionally, it may be remembered that moths seldom touch clothes that are frequently disturbed."

FIRE EXTINGUISHERS.—Some time ago there was a bit of discussion about "fire extinguishers," with opinion not exactly in their favor. We have had the sulphuric acid and soda extinguishers ready for use on our place for several years, and the time came when the one in the kitchen saved the house. It was in a dry spell and the fire was in the wood shed roof. By the time we could have had ladders and buckets on the job (there were only children and women here) it might have been beyond us. They gleefully told their father how quickly "Mother had that fire extinguisher going." To show his appreciation, he lost no time in getting it "loaded" again. This "extinguisher" will throw its stream on to any of our roofs. The extinguisher would be easier for fires within easy reach. It is scarcely more than a foot long and works like a piston syringe. Unlike the others, it stops when you stop. It will put out gasoline and sensible people carry one in the automobile. Also I believe it is frost-proof, which the other is not, unless salt is added to the solution, and I believe there is some objection to that. Perhaps it hastens deterioration in the machine. There is no doubt in my mind as to the efficacy of "fire extinguishers." I would not stay long without one where I could get it into action. I should think insurance companies would compel their policy-holders to keep them, but there have been some queer things brought out about insurance lately. All I can be real sure of is that I do not want a fire.

MRS. W. W. SHEPARD.

Genesee Co., N. Y.

GRAMMATICAL MISTAKES.—A local school-teacher says she started teaching with intention that no grammatical mistakes should be made in her room. She taught in a factory village, and had to correct the children so much that they soon were afraid to speak at all. Now she apparently notices only the most glaring, like "hain't got no." I labored hard one term with a girl only to hear her remark, "Won't I tell mamma what is wrong when I get home." I know a high-school principal whose slang needs translation. Book English is apt to be stiff; there is no harm in colloquialism. I don't want anyone to be over conspicuous in speech. By the way, when mother refused to let us say "Shut up" and we wanted to, we said: "Have the goodness to close that cavity in the lower part of your countenance intended solely for the mastication of food and continue to remain silent." E. S. K.

CARE OF A CANARY.—A good many years ago, when I was a very little girl, I was awakened one Christmas morning by a most unusual sound. Downstairs I rushed, expecting to see Santa himself, but found instead a canary bird in a cage. A friend of the family had left it for me the night before. The canary, which had been named "Bobby," and I became fast friends, and he lived until I had grown from a very little girl to a very big one, and he might have lived much longer, if he had not been accidentally killed by his cage falling to the floor. He was always healthy, and sang very much. We never had another bird with him, but he never pined or moped, and seemed very happy and well all the seven years we had him. We fed him seed, the commercial mixture, being careful that there was not too much hemp seed in it, as birds like this seed, and will eat too much of it, if allowed to do so. Canary, hemp, rape, and millet seed form a good mixture. A piece of cuttle fish bone was always kept in his cage. He was given fresh water twice a day, oftener in Summer. He was given a bath once a day, while his cage was being cleaned. A hard-boiled egg, a little piece of hard bread, and some green food, like the leaves of the common Wandering Jew, were given him from time to time.

He never would take a dust-bath, being accustomed to splash in the water every day to his heart's content. Poor "Bobby" knew no life but that in a cage, and was never happy out of it. He spent the Summer days out of doors, his cage hanging on the porch, seemingly as happy as the wren, who scolded him, or the cat bird, that mocked him, but of my own free will I would never cage a living thing, and I would say to one who asked—"The best way to keep a canary is where the Creator intended him to be, out in the free air. As Emerson said:

"I thought the sparrow's note from heaven,
Singing at dawn on the alder bough;
I brought him home, in his nest, at even;
He sings his song, but it cheers not now,
For I did not bring home the river and sky,
He sang to my ear—they sang to my eye.

C. G. J.

"CITY HELP."—On page 792 I see the item of "City Boys as Helpers." May I tell my story? I have had five of them; two were all that was to be desired, two were fair help, but the last one was a bad egg. I can't find one good thing to say for the last one. Yet, the same mail that takes this to you, takes a letter to the same school I got the two good boys from.

H. E. VAN TASSEL.

KEEPING HAM THROUGH THE SUMMER.—For each ham from a hog weighing about 200 pounds use a pint of fine table salt, three tablespoonfuls brown sugar, two tablespoonfuls black pepper and one tablespoonful cayenne pepper. As soon as ham is trimmed in shape rub this mixture in thoroughly, especially around the bone. Wrap in paper folded closely about it, and tie. Put in cloth sack and hang up with small end down. Meat prepared in this way will keep perfectly for several months, and the lean does not get hard as it sometimes does when packed in brine. B. C. F.

BEESWAX.—J. A. G., on page 769, wishes to know how other farm women extract beeswax from the honey comb. An easy way to extract the wax from a small quantity of comb is as follows: Put the pieces of comb into a colander, set the colander into a deep pan containing a little water to prevent burning, and put the pan into the oven of your cook stove. The heat of the oven will do the rest. If a large quantity of wax is to be extracted, it is best to use one of the several excellent wax presses now on the market. F. R. H.

POOR PORK.—I would like to have some of the readers of THE R. N.-Y. tell me what is the matter with our pork. After keeping house for more than 35 years, and having the finest salt pork that could be asked for, now for three successive years it has spoiled. We have given it the same treatment that has heretofore been perfectly satisfactory, and after about two months or perhaps three, it becomes rather soft and smells badly, so we cannot use it. There remains quantities of salt in the jar and the brine seems to be exceedingly salt, but the meat is spoiled. Can THE R. N.-Y. solve the question? H. B. B.

Biscuit Without Waiting,

"YOU certainly are a master-hand to turn off work," said Mrs. Adams admiringly, as her friend slipped a pan of biscuit into the oven and set about arranging the table for lunch. "I always thought I was quick but you certainly have me 'beat a mile' as Bobby would say."

Mrs. Carson laughed. "I have half a notion to keep still, and accept your praise as a tribute to my ability, but the truth is, anybody can be just as quick. My biscuit-without-waiting recipe is the result of an accident, like bleaching sugar and making glass and a few hundred other things. Do you remember the supper we were going to give at our church last Fall?"

"For the Harvest Home? I should say I do. We had fried chicken, stewed chicken, chicken pie, chicken croquettes and chicken patties for a week. You know the creek raised so it washed away the bridge, and we couldn't get across. I had my chickens all dressed, so we just had to eat them."

"I think it was the worst storm I ever saw," returned Mrs. Adams. "Lizzie said it would have made Noah think of old times, you know what an irreverent thing she is. I was to supply the hot biscuit, so I had taken a sack of flour and measured it and added salt and baking powder and shortening, so there was nothing to do but the milk. Of course nobody came, so there I was with all that prepared flour on hand. I put it in a big can, and used it when I wanted biscuit, till it was all used up."

"But did it keep? I should have been afraid of the shortening," said Mrs. Carson.

"Yes it kept perfectly for several months," answered her hostess, "and since then I have never been without a similar can of flour on hand. It makes biscuit making a pleasure and about the easiest thing there is to get in a hurry."

Colorado. MRS. E. M.

The Hen With a Record

IS to be the bird of the future. She is the one most likely to take the job of mounting the American flag away from the Eagle. The record that counts is the one made at an authorized egg-laying contest.

Farm Women Raise the Business Hen

We believe that some of the most profitable flocks in the country are to be found on the farms—developed and kept by farm women. The egg-laying contests have thus far been used mostly by breeders of National reputation or by amateurs with whom poultry keeping is more or less of a plaything. We believe there are farm women who have the birds that can hold their own with the best. To prove it we offer

A Free Chance At An Egg-Laying Contest

THE R. N.-Y. will pay the entrance fee for one or more pens of birds to be made up from the flocks of farm women who care to furnish a hen for such a contest. Such women may send their best hen or pullet of any breed they prefer. We will make arrangements, pay the entrance fees and see that the hens are properly and fairly handled and fed and recorded.

Your Hen Will Be Tested

with a record that will be official and if she can make a good yield your flock from that time will be in the position of a herd of dairy cattle which have made large records for butter or milk. Mrs. Newly-rich said her Orpington hens *could* lay, but *they were not obliged to do so.* The farm woman's hens have got to lay to give her pin money and help pay the mortgage. Some of those *got to lay* hens will make things lively at an egg contest.

Will You Enter A Hen?

First of all, we want to know whether our women readers would like to enter a hen for a record. If so, please let us know at once and we will make all arrangements and give information about handling and training the hen.

Food That Tastes Good

Is What We Call For

The Farm Provides It

Brown Sugar and Hard-tack.

I HAVE been stirred up by your symposium on "eating." It recalls the gastronomical efforts of 75 years. Any healthy boy who has worked as all boys ought, will come to dinner with a ravenous and glorious desire to clean off the table, and a capacity that no figures involving height, length, breadth and thickness can account for. Indeed, where the solids are deposited is as unsoluble as was that of the Kansas farmer's pig which had eaten clean a pailful of buttermilk, and the awestricken owner took the pig by the tail and dropped him into the bucket; it was not full. So the circle around the waist of a healthy young man cannot be square.

In all regions in America I have eaten my way through or left a devastation. The natives have certain national and traditional dishes in which they excel. No people on earth can equal chicken pie, dried beef and cream, or baked beans put together by the real New England housewife. To my taste no cornbread, fried chicken and beaten biscuit quite reach the perfection attained by the old black mammy of the South. I have never seen so good oysters as along the Gulf of Mexico, where also I have found the best bread, spaghetti and gumbo. If I could be translated bodily to Boston I should call for fresh codfish, lobster and hulled corn and milk, and grumble at the parsimony of nature that gave me one mouth only to absorb them. After all, this proves nothing but my individual taste, and that each locality excels in its peculiar products which generations have brought to perfection. Many of our tastes are acquired and sweetened by youthful remembrances.

I observe some of your correspondents refer to the "best meal" they ever had, such gorgeous reminiscences probably emanating from the hunger of that particular period. Let me recall the "best meal" I ever had.

On the 17th day of May, 1863, I was a youth with good teeth, a splendid set of internal arrangements, sitting down beside the road near the Big Black River in Mississippi. A regiment in front was busy clearing away the skirmishers on the opposite side of the river, preparatory to laying down a pontoon bridge. It was the day after the great battle of Champion Hill, and the climax of the Vicksburg campaign. I was captain of a company in an Illinois regiment that left its dead in many States. The men were very short of provisions, trains far in rear and country cleaned up by those in advance with the usual diligence of the 15th Corps. One of my men had, fortunately, among the first comers, found a hogsbead of damp brown sugar in a little tumble-down shed near. He ran back to me and asked if I wanted some sugar. I loosed a two-quart pail from my belt, my entire cooking outfit, and handed it to him. I had eaten nothing since the day before but one "hard tack," for the good reason that I could get nothing else. He soon returned me the pail about half full of brown sugar. Just then some troops came marching up from a rear division and I bought from a private three hard crackers for $1. Just there and then I enjoyed the best meal of my life. The combination of hunger, good teeth and the appetite of youth gave to commonplace things all the luxuries I can recall. The sound of the cannon nor the whistle of rifle balls interrupted the enjoyment, as I began to feel the expansion press against my sword belt. The environment was such as historians write about and poets put such events into epics. No dramatic thoughts entered my brain. No romance thrilled me, but the satisfaction experienced while sitting there on the ground with no drink except a canteen of warm river water, tired and dusty, as I ate a quart of brown sugar and three hard-tack, has not been forgotten. This was 51 years ago, almost to a day, yet I recall it was the most enjoyable meal I ever surrounded—it was because I needed it more.

Illinois. L. B. CROOKER.

The Professor's Best Meal.

THE request for a description of my best meal raises an impossible situation, because I have eaten so many meals, in so many places, and so many of them have been so good. I have enjoyed my meals. It is one of the satisfactions of life to eat well and to sleep well. These are fundamental necessities and all the exotic interests that are coming to us with our increasing complexities of living do not take the place of them or make them less important. The greater the variety of our activities and the more numerous the kinds of our goods, the greater is the necessity that we eat well and sleep well; and to this should be added the great joy of working well.

But to eat well requires a simple and a substantial diet; and this is the diet that I have found at so many farmers' tables. It is a great source of satisfaction to have one's eatables in sight, with as many eatables as there are dishes, and with the eatables more important than the service. A person is able to plan his eating and to judge his meal as a whole. This is the farmer's meal. The members of the farm family undertake the meal with the same directness and simplicity that they undertake the work and the duties of the day. This is worth while, in these days of much indirectness and of many intermediaries.

The farmer's meal also has in it the close connection with the earth and with the locality. It is not all assembled from boxes, and bottles and tin packages. It partakes of the open fields and of the home oven, carrying a kind of personal quality. The regular hotel meals are about the same the world around, but every farmer's meal is of his farm and his household. It is with much satisfaction that I sit at a farmer's table.

L. H. BAILEY.

Baked Beans in Nebraska.

UNDER the circumstances, here is the bill of fare that I would like to sit up to. In fact, it is what I usually order when at a restaurant or hotel, if I can get it: Roast beef (well done) with brown gravy, baked potatoes, whole wheat bread, butter, cold or hot water, according to season; fruit, and a pleasant companion to share the meal. If that first item is not available, cold baked beans and some hot flour gravy for the potatoes makes a very good substitute. In fact, except for the roast beef with brown gravy I have simply given our regular dinner menu. It must be about a balanced ration, for I do lots of hard work on it nearly the year around, and am in fine health.

Nebraska. J. H. TUBBS

What a Veteran Would Use.

IF I could have the appetite of a boy or young man, and could have it fully satisfied, also the judgment as to what was best for me in view of the experience of a life of nearly 70 years, I would say the following: First of all, I would want good light bread, made from cream-colored flour, as the mainstay, with a change of whole wheat light bread, Graham gems or muffins, corn bread made of stone-ground meal, buttermilk and soda; an occasional mess of cream biscuits and pancakes made from buckwheat flour, whole wheat flour or cornmeal, or a mixture of the two latter, with plenty of butter and honey.

Vegetables and fruits of all kinds that can be grown, both cooked and raw, would come next. The cooked vegetables I would want boiled in nearly every case and very rarely fried. Smothered in cream, butter or olive oil would be a good way to cook them occasionally. Fruits cooked into plain sauce without much sugar, or baked, suit my taste and judgment best. Fresh berries and peaches, with cream and sugar, are always acceptable, and next to them in this form would be canned, with a little sugar, and served with plenty of cream.

"A FULL MEAL." THE BOY CANNOT BE TEMPTED, EVEN BY GRANDMOTHER'S MINCE PIE!

I would have but few pies, and these I would want thick, "fat" ones, stuffed full of fruit. As to meats, I would want some tender beef, mutton, pork, chicken and game of all kinds, boiled, baked, broiled or smothered, and never fried in grease, is the way to cook them. Fish fried in bacon grease or olive oil, baked or made into chowder is all right. Bacon or ham and fried eggs would be rarely indulged in, but soft-boiled and poached eggs I would want often for breakfast. Of cereals, give me plain rolled oats, wheat, rice and hominy for breakfast, with all the rich cream to go with them that can be afforded and a little soft brown sugar. Occasionally a full supper of old-fashioned cornmeal mush and whole milk would be wanted. Not one of the fancy cereals would come into the house, because they cost too much, and are no better in any way than the plain oat, wheat, corn and rice thoroughly cooked that cost about one-fourth as much. H. E. VAN DEMAN.

A Truck Grower's Feast.

I WOULD have first a heaping dish of asparagus, all extra large green stalks—no white, cooked until it was tender, and covered with a home-made dressing. This dressing is made by mixing flour with the water in which the asparagus was cooked, together with a good-sized lump of butter and a little salt. This dressing would be supplied in liberal amount. On the opposite side of the table there would be a dish of yellow Jersey home-grown sweet potatoes. I would have these sweets first boiled, then cut in halves, butter spread over them, sprinkled with a little sugar and browned in the oven before serving. Besides these two things I would have an abundant supply of mealy white potatoes, boiled, mashed, moistened with cream, and well beaten up until they looked like creamy white foam. I would also want a dish of sweet garden peas, picked while still young and tender, cooked just the proper length of time, and with a little butter mixed through them in the way of seasoning. They would be served swimming in their own essence. These four vegetables, together with good home-made bread and butter, would be the main part of the meal, and I would want all placed on the table at the beginning of the meal. There would be no side dishes. As a beverage, I would select good sweet new milk that had not been skimmed. For dessert, nothing could possibly suit me better than a large saucer of "Superb" or "Uncle Jim" strawberries together with sugar and cream. TRUCKER, JR.

A Good Farm Breakfast.

SINCE my good husband has been so extravagant in his praise of my cooking, I think I will get even with him by sending you his fancy breakfast which he can cook to a turn.

Whole Wheat Rolls.—Beat two eggs to a froth, beat in two cups of milk (sweet), a little salt, two tablespoonfuls of soft brown sugar and whole wheat flour to make a batter—thinner than pancakes, about like thick cream. Drop into gem irons that are hissing hot and bake quickly and thoroughly. To be eaten with butter and maple sugar cream which is made by boiling maple sugar and water till it will almost spin a thread, let cool and stir till it grains. The quantity of sugar and water is immaterial, and white sugar can be used with the maple, enough water to dissolve the sugar and boil rapidly to break up the grain. We make a quantity at a time as it keeps soft a long while.

With boiled eggs, good dried beef, fresh pineapple, strawberries and other fruits in season, it makes a breakfast easy to prepare and fit for a king.

MRS. CLARK ALLIS.

Saving By Process Canning.

IT seems to me one of the greatest needs of farmers today is to save all there is raised, especially about gardens. How often we see gardens with asparagus, string beans, peas and other things going to waste; yet all these may be successfully and easily canned so they will keep, forming a necessary addition to Winter diet. Years ago we found lima beans would not keep canned, yet by the process canning method they keep well, and are nicer than those we used to buy. Limas should be shelled, washed and boiled in salt water about 20 minutes, then place in glass jars; those with patent fasteners are preferable for this work. Fill the cans full and cover with hot water, add a teaspoonful of salt, cover loosely and place in an ordinary wash-boiler so they do not touch each other. The bottom of the boiler should be covered with a piece of wire cloth, which only costs a few cents, from the hardware man, and lasts years. Then add about two or three inches of warm, not hot water, and boil with the cover on one hour. Take cover off and set boiler where it will cool. Clamp covers on tightly, and the next day repeat; the last day fill the cans full of hot boiled water before putting on to boil. The cans need not be taken from the boiler until the work is finished, and one can do eight or 16 cans at once, according to size of boiler. Make sure to have good can rubbers and leave them on the cans. The first day's work will give any of the spores not ready to work a chance to do their fermenting, the third day catches them all and seldom indeed will a can spoil.

Tender dandelion and beet greens, in fact any of the vegetables we used to think impossible to keep, may be had in abundance all the year. In using peas, shell and boil with a generous amount of water in which the pods have been boiled, and the peas will be finer in flavor. Process three days. Pumpkin may also be used in the same way, as well as any kind of fresh fruit, although ordinary care will keep fruit without processing, but the flavor and color this way is unexcelled. Care must be taken to loosen the covers each time one boils the cans, and to tighten them soon as they are slightly cooled to prevent any of the spores entering the cans.

Ohio. MRS. JAMES LAMPMAN.

"WHAT is your alma mater, Mr. Nurich?" "Well, if you insist, I'll take a cigar."—Buffalo Express.

The Wild Flower Collector

New Business for Country Girls

By Ida M. Jackson

PART II.

PLANTS DESIRED.—All the early Spring flowers are listed except Erigenia bulbosa, popularly known in early days as "Turkey peas," "salt and pepper," and "Harbinger of Spring." This charming little umbel blooms very early, along with the little white Trillium nivale. There seem to be but few known stations for E. bulbosa any more, and if a collector finds a little plantation of it great care should be taken to preserve it. The flowers are delightfully fragrant, and its foliage, so airy and fern-like, lasts till mid-June. A collector may be called on for any of the following plants:

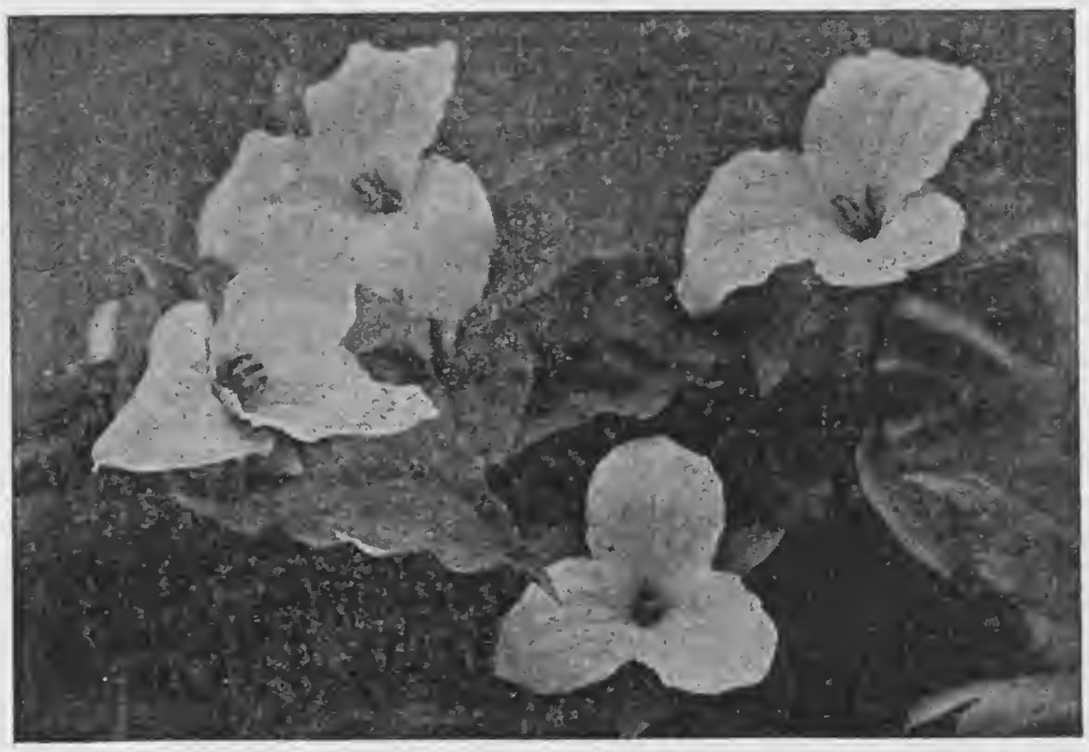
Hepatica, Spring beauty, bloodroot, Dutchman's breeches, buttercup, blue violets, rue anemone, false rue anemone, Wood anemone, blue vervain, Erythronium, Calamus, Greek valerian, marsh marigold, brown Trilliums, yellow violets, white violets, larkspur, sweet william, Oxalis violacea, Corydalis, blue-eyed grass, virgin's bower, Indian turnip, spider lily, cranesbill, blue flag, yellow puccoon, Indian pink, wake-robin, Collinsia, celandine poppy, shooting star, bluebells, star grass, lilies, mint.

About the middle of May those aristocrats of the forest the orchids, make their appearance. These are all listed. The insignificant little green-flowered Habenaria bracteata and the truly sweet and beautiful Orchis spectabilis are often found growing together on low rich ground well shaded by timber. Orchis spectabilis, when well-grown, is a splendid plant, and transplants as easily as a cabbage. I was so fortunate as to find a little colony of albino Orchis spectabilis. They are of waxy whiteness, and the most beautiful flower I ever saw. There is a white form of Camassia Fraseri and a lovely and very fragrant wild blush rose that are not mentioned in the botanies. The country girl must keep in mind that there is always a possibility of finding something new.

THE ORCHIDS.—A little later in May we find the splendid oriental looking yellow lady's-slipper with the barbaric purple and brown sepals hanging like corkscrew curls at each side of the "slipper." This plant does well in the wild garden. Late in June the beautiful pink and white lady's-slipper, Cypripedium spectabile, peeps out of her sheltering bower. A number of years ago the president of a Massachusetts college found a clump of pure white Cypripedium spectabile. It is thought he kept the locality a secret. Most of the orders for Cypripedium spectabile are filled in Michigan. Here they are dug by the hundred thousand. There should be a law against the indiscriminate slaughter of these innocents—for slaughter it is. No known plant, excepting Arethusa bulbosa, resents transplanting as does this queenly orchid. It languishes in captivity for a few short years and finally dies of a broken heart. Aplectrum hyemale (puttyroot or Adam-and-Eve) "the ugly duckling" of the orchid family, also blooms in June. It was once common enough but now it is considered rare. Its one large silky leaf is evergreen.

THE TRILLIUMS.—It is also in Michigan where Trillium grandiflorum grows so bountifully. There are three forms of this elegant plant; one blooms white and turns brown when withered, another blooms white and turns pink, and still another blooms pink and remains so. This last is the highest priced, bringing two dollars more per thousand. Trillium grandiflorum is shipped in large numbers to England, where it is prized above any other of our wild flowers. All the Trilliums seem to enjoy civilization, and are of great decorative value. The price is far too low for such desirable plants, Trillium recurvatum selling for three dollars per thousand and Trillium grandiflorum for five dollars per thousand. Last season a collector in Michigan, with two assistants, gathered and packed 25,000 Trillium grandiflorum in six days. The deal netted him nearly twelve dollars per day.

OTHER "BEST SELLERS."—Spring beauties sell for two dollars per thousand, and at first thought that seems very low priced, but they generally are found in such numbers that one could easily make ten dollars a day digging them. One more example: A man and boy got out 3,000 maidenhair ferns in two days. These were sold for $7.50 per thousand. The expenses were $3.00, which deducted from $22.50, leaves $19.50 profit. If such cases happened every day in the year collectors would soon be rich. More often they happen the other way. Sometimes we accept orders that do not pay us fifty cents per day; this may be on account of stock being scarcer than we anticipated, or too late to find the plants. There is always some one wanting something out of season. When the bloom is gone your chance of finding the plants is about one in a thousand. Last year a customer wanted snake-root in November.



TRILLIUM, WAKE-ROBIN OR BIRTHROOT.

PREPARING FOR ORDERS.—I would advise the country girl to start a bed of wild lilies, as they are always in demand. The wild tiger lilies (Lilium Canadense) and Lilium Philadelphicum are the commonest, and grow finely in low rich ground. A lily bed 200 feet square would hold 10,000 plants, and would be worth from $300 to $500. Besides these standard plants that have been mentioned there is often a call for something "queer"—like beechdrops, Indian pipe, lizard-tail, etc. When you locate any of these plants make a note of it, for they generally bring a good price. There is also another class of plants much in demand; these are mostly medicinal in character, though some few possess decorative value. Among these the most widely "hunted" plant is Hydrastis Canadensis, or golden seal. There are orders out sometimes for 10,000 plants, and not a single, solitary one forthcoming. A bed of golden seal is next thing to a gold mine.

SHOWY FLOWERS.—All in all, the most sought after plant is that tall, incomparable "primrose," Dodecatheon Meadia, commonly called "shooting star." Like the fringed gentian the shooting star must have rich muck soil—real peat is the best—to grow to its grandest proportions. "Shooting star" seeds abundantly, and when once started produces countless thousands in only a few years' time. Although there are several desirable gentians the blue fringed sort is the best. Gather the gentian seeds as soon as ripe and plant it very early the next Spring. In this way you can be reasonably sure to have gentians every year. They are a fickle flower. One year you have them and maybe the next year you don't. If the wild flower seeds were gathered and kept till early the next Spring and then planted it would be possible in a season or two to have fine beds of any of the desirable wild flowers of our locality. Of course there are exceptions to this rule; some seeds must be sown at once to insure germination.

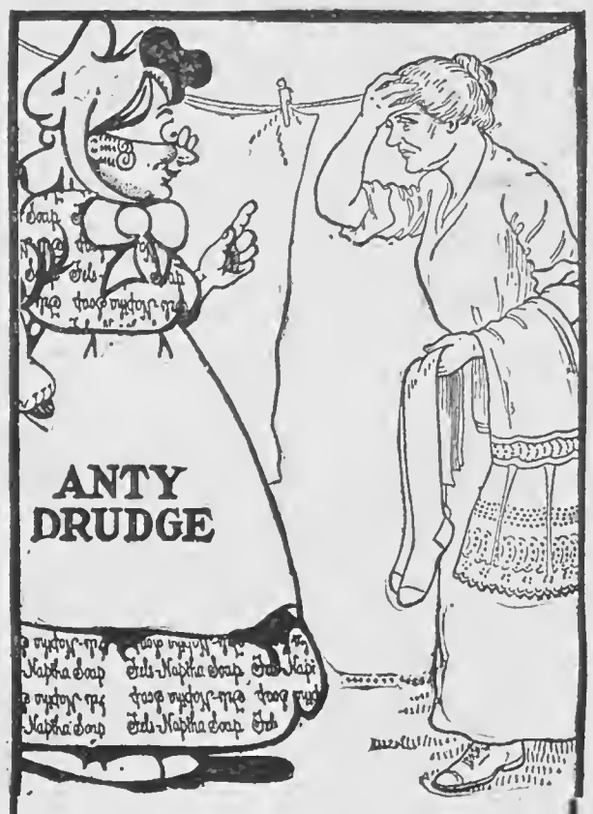
GROWING NATIVE PLANTS.—The country girl with a half acre of ground planted to 50 of the most popular wild flowers has not only a good living in sight, but can start a bank account. Every season a certain collector sells from a small plot of ground 2,000 roots of Oxalis violacea. Get your florist's catalogue and see how much they sell for at retail, and then calculate how much you could make from one square rod of ground planted to this dainty little blossom. You can grow 2,000 Oxalis roots to the square rod, and have room to spare. Many of our most beautiful wild flowers are fast disappearing. Those that are transferred to public parks and large private estates are sure of kind treatment. It is in accordance with our desire to protect the wild flowers to collect for the trade, provided it is done in moderation. It is not like caging an animal for the Zoo; on the contrary, many plants are greatly benefited by change of situation.

Pictures in the Home.

Last July I invested $1.15 in a way which has given me so much pleasure that I wish to pass it on to other readers of THE R. N.-Y. In June I sent to one of the firms which print reproductions of famous pictures for their catalogue. From it I selected 120 of their one-cent pictures, the number they would send for one dollar. I also bought a 10-cent tube of library paste, and got several sheets of unruled white paper. When the pictures came I sorted them, making two kinds, those which would go lengthwise and those which would go crosswise on a sheet of paper. I laid these pictures in piles face down.

I pasted my white sheets of paper in several places on the walls of my rooms, then put several dabs of paste on the back of a picture and placed it on the white paper. When I become acquainted with a picture thoroughly I remove it and substitute another. I see these while doing my daily work, and so without losing time become familiar with the world's greatest art treasures. It gives me a change of thought. Engravings come not only of pictures but statuary, architecture, etc. By having the pictures placed face downward one has pleasant surprises when changing and after a picture has been used I pass it on to a neighbor who uses it in the same way. The firm I patronized tells to what school each artist belonged in their catalogue, while on each picture, nearly, is given the date of the artist's birth and death, also in what museum or cathedral the picture is now. RUTH E. CLEMENT.

HERE are a few specimens of excuses actually received by teachers on behalf of scholars under their charge: "Dear sir, please excuse James for lateness, I kneaded him after brekfust." "Please forgive Billy for being tardy. I was mending his coat." "Mister sir, my John had to be late today. It is his bisness to milk our cow. She kicked John in the back today when he wasn't looking or thinking of her actin' so suddin. So he thot his back was broke, but it ain't. But it is black and blue, and the pane kept him late."—London Farm and Home.



Anty Drudge—"My goodness, Mrs. Careless, have you got neuralgia again? That's just what I told you would happen, washing the old way, with hot water. You have to rub the clothes so hard you get all overheated, and then you fill your kitchen with hot, sudsy steam while you boil your wash. No wonder you take cold, coming right out in the air. I haven't had a cold nor neuralgia since I started using Fels-Naptha Soap and cool or lukewarm water for my washing and all my housework."

Lots of women don't know how to do their work easily, quickly and better than it was ever done before—but there is a way.

It's the Fels-Naptha way.

Fels-Naptha Soap, in cool or lukewarm water, without hard rubbing or boiling, makes the dirtiest clothes clean and white. It's just as good for all kinds of housework and in the milkroom, and it's the *pleasant* way to do disagreeable work.

Buy it by the box or carton and follow directions on the Red and Green Wrapper.

Fels & Co., Philadelphia.

FELS-NAPTHA

Selecting a Hat

Suitable for Portly Women

By Esther A. Cosse

DIFFERENCES IN STYLE.—It is easy in these days to study newspapers, magazines and fashion books and thus keep well informed as to the changes

HAT SUITABLE FOR A STOUT FIGURE.

in hair dressing, etc. The tall slender woman must not wear her hair too high, hence only certain hats become her. Those of medium size, or a little larger, trimmed low, are the most suitable, especially if her hair is fluffy about her face. The small hat will make her look taller and older, while the low, broad one will make her appear broader. When selecting a hat it is advisable to ask the saleswoman to put a pin in the center front, where it can be left until one gets home and tries it on and becomes accustomed to the shape. Or better still, put one in yourself, then you will be able to fit it to your head just as you saw it before making the purchase. Never be satisfied with a hat until it fits the head comfortably. There are several ways of having this done. If it sets too far down on the head, do not have a straight, or even a plain round band set in. It adds to the weight and is unnecessary.

FITTING THE HAT.—Always try to arrange the hair in the way women of your type wear it, since it has been fitted to a certain shaped head. Of course, some will have more hair than others, still in these days women with little hair can find a good substitute. But the headsize allows for those with little or much hair; thus the use of a band in some cases is a necessity. Before selecting a band see if the fault can be remedied by shirring the lining up tighter. If it is too long to shir up tight have it cut off, then shir it close. This will raise the hat considerably and save using a band. If the crown is too small, let out the lining and the hat will set down farther over the hair. If this will not do, then have a band with a wire outside covered with a bias strip of velvet and a piece of ribbon sewed in the inner edge which can be drawn up or let out at will. This must be made of velvet one-eighth of a yard wide and just large enough to sew into the crown. This band has been designed especially for women using applied hair. When they use it all the ribbon is let out, when they wear the hat without the extra hair, the ribbon is drawn up tighter, making the head size smaller. Another way to make the headsize smaller is to take a piece of stiff brown paper long enough to reach around the headsize; fold four times into a strip one inch wide and sew it around headsize just inside of the lining. If this makes it too small, fold paper twice and insert. In some hats there will be a space at the side, which, if left, makes the hat unsteady on the head. Take a piece of cotton batting as long as the space and cover with velvet or silk the color of the hat, sew it in either inside or on the outside of the lining. It is always advisable to sew paper in hats for children, especially where a hair ribbon is worn on the top of the hair, which causes the hat to be unsteady on the head.

SELECTING THE FRAME.—For the made hat it is very easy to change a wire frame. Loosen the hat lining, take a pair of nippers or pinchers and bend down over the head, making the head fit close to the top crown.

MAKING A HAT.—To make this shape one would need a piece of either black or white frame wire, depending upon whether the hat is dark or light, costing 20 cents; one spool of tie wire, costing five cents for uncovered and 20 cents for covered; or one could buy three yards in a millinery store, which would be sufficient for the hat; eight yards of straw braid, which retails from five cents a yard and up; one yard of covering, for 10 cents, two quills for 15 cents and two yards of No. 12 black velvet ribbon for 20 cents a yard. It can be lined with a small piece of silk, or piece of lawn, or of old ribbon which has been pressed. The hat would then cost you but $1.25. In making the frame you will need a pair of nippers or pinchers to cut and tighten the wires. Cut off four wires 23 inches long; one 38 inches; three 30 inches long; one 32 inches and another 10 inches. The headsize wire, or the one nearest the head, must be made large enough to slip over the head comfortably and then allowed an inch larger for the covering. It is impossible to say just what the headsize should be since it varies with every person, but it runs from 24 to 28 inches. Take one of the 23 inch wires and bend upward one inch from the edge, over two inches and fasten to headsize wire by twisting aronnd it; 3¼ inches, bend over, measure 8½ inches, bend downward: 3¼, bend and fasten to headsize same as the other side directly opposite; two inches, bend upward. Put each of the 23-inch wires on in this way, the only difference is with the direct side wire, which must measure 8¼ inches across the top of the crown. The wires must be fastened firmly and tightened with the nippers or pinchers. You next take one of the 30-inch lengths

MODIFIED TURBAN SUITABLE FOR WOMAN WITH A ROUND FACE.

would make her appear too short and display her figure to poor advantage. The small hat also makes her look broad and not well proportioned. Only medium-sized shapes should be worn. They may be trimmed very high (usually it is necessary) as it adds to the height and dignity of appearance of the stout woman.

COLORS AND SHAPES.—The woman with a round face should use round hats. If she desires longer shapes dress the hair full about the face and low in the neck, but the hair arranged moderately high is usually the best for the round-faced woman. Another very important thing is the selection of colors. Most women imagine they must wear black hats year in and year out. Why do they think that? It has been said many times that black looks well with any colored costume. This is not strictly true. Certain shades of blue, green and brown should never be worn with black, as the colors do not harmonize, but in many cases women follow this as a reason for their selection. The person with high color should not select hats with a facing of warm colors, leave that to those with no color, as they need it to strengthen and give expression to their features. Ostrich feathers are becoming to any type of woman, if the hat is used as a dress hat, but not for a hat which is used any time of day. Flowers are well, especially for the afternoon or dress hats, but quills and ribbons are the most practical.

STYLES IN TRIMMING.—One of the most popular trimmings put on the market this season is the cire, or stovepipe finish ribbon. This is very highly finished and makes a pretty trimming, but for one who does not have many hats, it is not very practical, since it is finished with very strong chemicals, and though soft and pretty when new, it will not wear as long as some of the old types, among which is the satin taffeta, taffeta or the pretty prints. Any of these will wash in alcohol and look as well after being pressed with a moderately hot iron as when they were new. One hat that is becoming to most types of women is the sailor, which this year is made straight, but with a large headsize, which slips

HAT BECOMING, BUT TRIMMING UNSUITABLE. A BOW OF THIS SIZE AND SHAPE ANNOYS ALL WHO ARE NEAR, AND STRIKES BACK OF CARRIAGE WHEN RIDING.

and put around the top of the crown, which is fastened with the tie wire. The outside wire is next put on. This is the largest wire and must measure 36 inches and must be lapped at least four inches, but it is better to have it lap more. It is fastened to the brace wires by twisting the braces around it and fastening firmly with nippers, or the frame will not be firm. The next largest wire is used for a brace around the inside, fastened with tie wire one inch from outside wire. One is put around the side crown and another around the center of the crown.

COVERING THE FRAME.—The frame is then ready to be covered with crinoline, which is stiff and quite heavy. This is pinned to the frame and fitted on the lower side. A pin is put in the covering at the center front and center back, then removed and put on the top, but the headsize must be cut out, which is done by slashing it up to the crown after cutting out a small circle in the center. The crown is next covered and all small plaits are drawn to the base of the crown. This covering must be pinned carefully as you go along. The facing is put in last and the edge is turned up on the top. You then bind the edge with a bias strip of the crinoline one inch wide. This will make the edge firm and when straw is attached will not draw the frame out of shape. Eight yards of braid will be needed. Start at the center back, which is the center of the piecing of the wire in the frame, and the center front is the wire directly opposite. After starting the braid at the back you sew it around, leaving it about half an inch over the edge. As you get to the back, and the brim is completed, draw the braid up to the crown and start at the crown and continue around and around until you reach the center of the crown. Then cut off the braid and turn it under and finish off neatly. If you look you will see that the braid contains a thread which you can draw up on the inside edge of the braid. It sets smooth if this thread is drawn up as it fits the braid to the shape. This must be done to the crown as it will pucker if the braid is left straight, and not look well. The facing is put in last and the outer edge is caught to the edge of the outside braid by slip stitching with invisible stitches.

TRIMMING.—It is trimmed with two quills laid on at the side and finished with a small bow with loops and ends six inches long; one loop and one end each way. When the bow is tacked over the place where the stitches show from tacking the quills, sew a piece representing a tight knot. A small bow is made and tacked at the right side back. The lining is then put in by holding the hat up to you and starting in the center back and sewing in with double stitches about one inch long on the wrong side. Turn the lining in after you get all around and shir up the other end, or run it with an ordinary running stitch and insert No. 1 ribbon to draw it up. This completes the hat, which if bought in a store would not cost less than five dollars and is practical for the woman who has but one hat, as it can be made in any color and the black trimming will make it appropriate to wear with any combination. The materials are always easy to get, and in these days of parcel post one may send even to the large cities, and it will cost but a few cents. Write your order thus:

One piece black (or white) frame wire	.20
One spool uncovered tie wire	.05
One yard black (or white) crinoline, (heavy)	.10
Eight yards ——— braid at 5c	.40
Two black quills at 15c	.30
Two yards black velvet ribbon at 20c	.40
	$1.45

A Girl's Summer Clothes.

I AM not a village dressmaker, but I am the mother of five married daughters, and I have always made their clothes with the exception of an occasional tailored coat or suit. I am very much interested in the question of young girls' clothes. It may be possible that I can help some one who has this problem before them at the present time. There are so many girls and young women who do not know how many pretty and inexpensive materials there are on sale this year. We will begin with a pretty, figured voile, at 25 cents a yard, and 40 inches wide; make with a two-piece skirt

METHOD OF HOLDING NIPPERS WHEN FASTENING THE WIRES.

and two circular flounces, kimono waist with vest, sleeve ruffles and collar ruffles of white net, at 25 cents a yard; three-fourths of a yard will be enough. Five yards of goods, at 25 cents, will cost $1.25, including net at 25 cents a yard, will be $1.50. This dress will be suitable for church, afternoon parties and afternoon teas. Another good, serviceable dress for riding or driving is linen-colored crash. It will cost from 35 to 75 cents, and 2½ yards will be enough for two-piece skirt, to be worn with "Middy" blouses and shirtwaists. MRS. W. W. S.

The Land of Fulfillment

A Story of Homesteading

By Rose Seelye-Miller

(*Continued from page 763.*)

NORM found that while he could break but two acres a day with the oxen, with the new team he could break three acres; so it seemed to be a real, practical transaction—the buying of the team. The boys found little time to work at the polishing of the horns, and yet they felt such a deep necessity for the same that, utilizing every ounce of strength and every moment of time, by the 20th of October the second lot was shipped, and the check for ninety dollars looked like a veritable fortune to Nate and Norm. This money was immediately applied on the note, as it had been agreed that it might be lessened or taken up any time on or before the end of the six months' time. The days were constantly shortening, and the work in the field lessened, so there was more and more time for the horn polishing, and the third shipment was ready, when a letter came cancelling the order. A change in the management had taken place, and no more consignments could be made to the old firm, nor to the new, unless they should so order.

This was a terrible blow to the young enthusiasts. They had practically spent all their money, they were in debt sixty dollars on their team, and the supplies laid in would not last all Winter, and there seemed no outlook for any paid work anywhere. Norm became very despondent, but Nate was still gay and light-hearted. The glory of the new life had entered his soul, and it seemed as though he could never be unhappy again.

"Maybe we will find something else. Maybe we will get a better market, or something; who knows? It has seemed like a year of miracles to me all along, and I shall not be surprised at anything. That one curio firm isn't the only one in the world. We'll work anyway; we'll polish and scrub and rub and oil. There is lots of fun just working. The world is probably starving for buffalo horns, if we only knew just where the famine-stricken district might be." Nate laughed an infectious laugh, and Norm joined in, saying:

"You'd make a pretty good Christian, Nate, if faith were the chief requisite. Your optimism is pretty good dope to take, anyway. And here's to you. We'll work at everything we can find to do, and polish buffalo horns in the odd minutes."

So both boys rose above their discouragement temporarily, and went at their farm work with renewed vigor. The Fall was an open one and sunny away into November, but the soaking rain had kept the breaking possible. But little by little it grew colder and colder. The ground would be frozen a little in the morning, making breaking impossible until about 10 o'clock in the morning, and finally the freezing did not soften; and at last, with one hundred acres ready for the coming cropping, the boys accepted the dictum of Winter and ceased their efforts in the fields.

But there was work, work, work. The tar-paper was put on the shanties and on the little barn and hencoop, and many little conveniences made in the home places, for they maintained each his own place, although they were together the greater part of the time. They moved the grindstone and the bone-cutter to the shanty on the east of the creek, partly because they did their main cooking in the other one, and partly because they were less disturbed there. In this shack began the real work of bone-cutting. Failing on the horn business, Nate determined to make a venture at selling bone meal as a poultry accessory. He had ordered sacks with his bone-cutter, and these sacks he stenciled from a cutting made by himself on a piece of cracker-box cardboard. The sacks bore this legend:

"PURE BUFFALO BONE MEAL
FOR POULTRY. N. & N. CO."

After the sacks were ready, Nate printed on a large board, a sign reading:

"Buffalo Bone Meal for Poultry. The Only Buffalo Bone Meal Made. Produces the Biggest Eggs and the Best Poultry. Free Sample. Ask for it."

With this notice and prices printed in Nate's best lettering, on a clean, smooth board, the two boys stationed themselves upon a busy corner of the city street one Saturday afternoon in late November. Nate and Norm were good-looking boys, not so much from regularity of feature, but because they looked alert and alive, as though life were well worth living and work well worth doing, for the pleasure of the work as well as for its other rewards, the reward, of strong muscles, sound sleep, and good appetites. They wanted money, to be sure, but they wanted to give a full equivalent of work value for the money. They had no idea or thought of seeking a "soft snap," or an easy job. Both boys wore brown duck overalls and sheepskin-lined, brown duck coats, while fringed chaps, and felt sombreros added the picturesque touch, peculiarly Western. The boys had not stood there unnoticed, and here and there one paused to read the inscription on the board, and passed on. But although they had given away at least a fifth of their little sample sacks of the buffalo bone meal, no one had bought or ordered further.

Suddenly from out the throng, came a figure and face they knew, and with no thought of bone meal or of sales, Nate gave a cheery hail, which was answered by Tom Miller, the man for whom the boys had worked in thrashing. There was a vigorous shaking of hands and quick shot of question and reply. Finally Tom Miller espied the board and its legend: "What's this? Bone meal? Giving it away?" he said, alertly.

"Only giving away small packages," Nate admitted. "But we'd like to have you take a hundred pounds if you have any use for it."

"Sure," cried Tom. "Just what we need to set the hens to shelling out Winter eggs. Wife has been worrying about their not laying for sometime. I'll put a sack or two of oats in your wagon, when I get the meal. If you've got bone meal to give away I've got oats," and Tom laughed, one of his good, infectious guffaws. "Where's the oxen?"

"Oh, we're getting to be bloated bondholders," Nate chaffed. "We're driving a little real horseflesh now. We put them in the livery barn, for we expected to stay all day."

"Say, our boys think we never had such a cook on the thrasher. Don't you forget it, you're part of my crew another year—both of you. Now for the bone meal. Wife'll be tickled to death to get it. And fetch in about three hundred pounds when you come in, leave it at the mill for me."

A crowd had collected while Tom Miller had talked, and at once another man stepped up, to whom Nate presented the little gift sack of bone meal. The man looked at it questionly. "Say, this might look like a big feed to an Easterner, with six hens, but I reckon there wouldn't hardly be a chip apiece for my flock. I may's well take a full sack, and you give this to some little feller, with a pair of hens."

"This is only fed sparingly, and not for a full diet," Nate replied laughing joyously. "Where's your rig, we'll load a sack for you."

Before night the stock they had brought was exhausted, and the boys light-hearted as larks, were about to pick up their sign board and move homeward, fully intending to fetch in a few sacks of the bone meal each time they came and sell it on the streets.

"Come in, you chaps!" called a hearty voice from a butcher's shop near by. "Come in and set by. I see you've got a good thing there, now I'd like to handle your product."

After a little talk, it was agreed that the boys should sell to this man, Mr. Thompson, their meal, for three dollars a hundred, he would sell it for four dollars a hundred.

"I'll save all my scraps of meat and bone, for you, it will make it a more lively feed, and a better egg producer, and we might as well mix in a little red pepper, and Venetian red, these are both fine for poultry, and we'll have the best stuff on the market."

"We needn't worry any more about that note," Nate said happily as soon as they were again upon the street. "It's easier to grind bones and less fuss, than it is to polish buffalo horns."

"Did you have this in your head, when you picked those bones?" Norm asked admiringly.

"No, not a bit of it, I just thought I could help Jim and so pay for the use of his plow and things, and then when I saw how the hens ate the chiped bones, I thought maybe I could sell a little, but never any such amount as this: I had thought vaguely of shipping the bones to some fertilizing plant, but we're so far from a railroad it would take time to haul them, and the pay wouldn't be half what we'll make this way. I don't know but we ought to share with Jim."

"We will offer him a share if he wants to help grind," Norm said cheerfully, "but as for the other fellows, who just dumped on to us without so much as asking if they might, they can come and pick out their bones if they want to, and set up in competition."

"This is riding some." Norm volunteered, as he watched the fine dappled greys, trotting along as though they enjoyed it. "I can remember, when Red and Roan were the height of my ambition."

"I can remember, though it seems ages ago, when I envied you the possession of Red and Roan, and felt that you were about the whole partnership." Nate looked affectionately at Norm.

"Huh!" snorted Norm. "You're worth two of me, you find harvests, and make money out of things that seem too utterly worthless to be noticed by the rest of us. Say, kid, I believe I'm going to raise you after all!"

Nate struck his chest a resounding blow, and both boys laughed, for life seemed like a large adventure to them, although their days were filled with the most menial labor, it was not so to them, work was a pleasure, an excitement, a joy, and the great game of homesteading seemed to them the most fascinating in the world.

The Winter was open and delightful. The oxen ranged out all day long, coming up at night for shelter. The horses and the cow, too nibbled at the sweet, dry buffalo grass, and throve upon it, liking it even better than the slough hay, the boys had put up.

Everything prospered. Even the few hens furnished a full quota of eggs, and Nate fed them enough ground bone to make their eggs all shells, had Nature so designed the egg. Even the cat, which had left while the boys were away thrashing, came rubbing about Norm's knees one morning as he sat milking, and later on she was found with a family of six ensconced in the snuggest corner of the hay. This pleased the boys about as much as the accretion of six new calves could have done.

"She'll bring us good luck, sure," Norm said, "for it's the best luck in the world to have a cat stand by you."

And sure enough the cat seemed to have brought good luck, for when Jim returned from Wetasket late that day, he brought a letter, and an order for more polished horns, and offering to take the entire output, as fast as they could be furnished. And so the sale of the horns and the bone meal, tided them over the Winter, and furnished money to help out in the Spring.

All the settlers, busy and happy, were making preparations for Spring's work. The boys had broken a hundred acres of land in the Fall, and they had decided to sow 60 acres to Spring wheat, but they had many counsels about the cropping of the other 40 acres.

"Wheat will have to be our money crop," Norm argued wisely, for wheat was the money crop in those early days. "I have seen oats and flax growing, but I don't know anything about spelt and millet."

"They say millet, flax, and corn can all be put in late," Nate replied also with great solemnity. "I don't know one thing from another, but I'm trying to learn."

"Things are done on such a large scale out here," Norm ventured, "it seems as if the very people are bigger than they are in places where a 10-acre field is a monstrous crop. I believe we'd best have the sixty of wheat, and divide the other 40 amongst oat, rye, barley and spelt. This will give us a chance to try them out, then we'll know another year what will be the best crop for our land. We'll break more land for flax and corn, and potatoes."

and Vegetables on the **"Granger" Fruit and Vegetable Evaporator.** Cheaper than canning—No loss—Dries fruit in two hours. Cost, $3.00, $5.00 and $8.00. Send for catalogue. **EASTERN MFG. COMPANY, 259 So. 4th Street, Phila, Pa.**

Indian Bead Work

NOTHING is more fascinating or more in vogue at this time than **Indian Bead Work articles.** We have procured an outfit for making these articles, which will be sent, delivery charges prepaid, for

ONE NEW YEARLY SUBSCRIPTION
OR
THREE YEARLY RENEWAL SUBSCRIPTIONS
(One of these may be the renewal of your own subscription for one year.)

This outfit consists of a Patented Loom for making articles, an instruction and design book, a spool of cotton, twelve H. Milward Sons' needles, seven bottles of colored beads—dark blue, green, light blue, black, red, yellow and white—a complete outfit to start the work.

Every woman knows and appreciates the value of these home-made articles.

Your neighbor needs *The Rural New-Yorker.* If he is not a reader get his subscription. If he is a subscriber get his renewal.

THE RURAL NEW-YORKER, 333 W. 30th St., NEW YORK CITY

Housekeeping Hints

Helps for the Home

The Last Half of the Dishes.

"IT'S the last half of the dishes that I dread to wash," sighed the oldest little daughter of a busy mother. Dear little maid, I expect we can all sympathize with her! And so, year in and year out, a vast army of dish-washers both old and young attack that last half of the dishes with main strength and the scraping knife. Is it any wonder that we dread it, and lose time and patience over the disagreeable task? Just a little prevention will work wonders in this instance, however, and is worth many of the proverbal pounds of cure. If the baking dishes cannot be washed at once, place them in a sink or a large pan and fill with water; even if they must stand for several hours before being washed, they will not be sticky or unpleasant.

When food is taken from the dish in which it is cooked, fill the emptied utensil with water, and when convenient place at the back of the stove where it will keep warm. If the dish is very greasy, add a little soap powder or soft soap to the water, or a few drops of ammonia, and keep the water moderately warm. When this is emptied, the dish will be in no way unpleasant to handle.

If food has burned in a utensil, a spoonful of wood ashes, kept in a convenient place for this purpose, added to the water and kept moderately hot will remove the burned particles.

A good kettle scraper can be found for a dime with which all particles can be removed without difficulty from these soaked pots and pans, and the washing is quickly over with a delightful absence of scraping on dried, discouraging surfaces. If the cleansed surface is not entirely smooth, rub with a little good scouring powder. Just a little forethought makes the washing of the last half of the dishes as agreeable as the first.

ALICE MARGARET ASHTON.

Housekeeper and Housekeeping.

I AM an old woman now, and as I look back over 40 years of housekeeping and home-making there are many times that I might have done better, many times just for lack of practical teaching. I see women often who are doing work in the hardest way because they really know no other. Here are a few things I have learned from experience. Remember I have lived on a farm where there has always been a shortage of ready money. I think if many farmers' wives should speak out their real thoughts I would not be lonesome for want of a crowd.

When you get up in the morning, as soon as you are dressed, do comb your hair. This seems an unnecessary thing to say, but I know several young wives who get the breakfast and appear at the table with their hair uncombed, and it seems to me a very untidy habit.

I have always found the best time to make my beds was before breakfast. I like to have them all out of the way. Of course, if there are small children let them sleep in the morning; it is good for them; but insist that they get up as soon as awake (this does not mean babies but older children). Perhaps some one will say, let your beds air. I say air your bedrooms and your beds will be aired. Don't fail to change beds often, taking off the under sheet and putting the top sheet in its place. Be sure to keep the sheets with the right sides together; then the same side is toward the bed, and where the person had lain will always be inside.

During the summer I use the sheets and pillow slips without ironing. I can almost smell the sunshine when I go to bed if they are taken from the line on a sunny day and put on the bed, which has also had a sun bath while I was doing the washing.

A good washing fluid is made of one pound of lime (such as you get in cans for whitewashing) and two pounds sal-soda. Dissolve in a gallon of water, let it settle, and keep in a jar, jug, or in glass cans. Add one-half teacupful to a boiler of clothes, or if you do not boil your clothes (I do not), put it in the machine to rub them in. Set the remainder of can of lime on an old plate in your fruit cupboard—you will not be troubled with mouldy or musty fruit—and although it is slaked, it will be just as good for the next mess of washing fluid.

I think one of the first things we should learn when we begin housekeeping is that there will be blue days, no matter how well you plan; days when "everything comes all in a heap." You just can't see through, and on just these days each man on the place needs something that makes it necessary for him to make frequent journeys through your kitchen, and be thankful if the sitting-room and chamber stairs are not included in their travels. Don't be cross; it isn't nice for a woman to get fretty. Candidly, it is far better not to add that to the other burdens you have to bear, for if you can keep a little sunshine inside and keep pegging with system you will (when night comes and your house is clean, your baking done and a good share of that awful accumulation of work straightened out) feel much more self-respect than you would if your nerves (otherwise temper) had got the best of you.

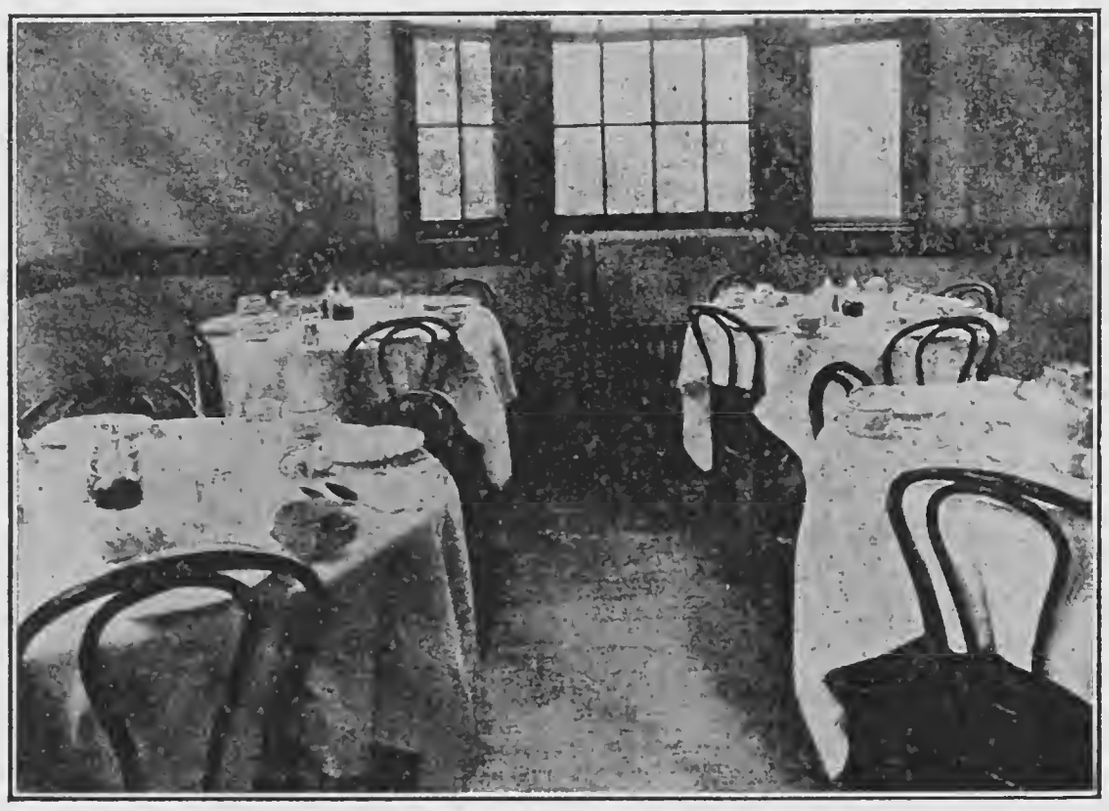
Now, don't think that in the 40 years of housekeeping I have always followed this golden rule. If there are any housewives who have they must be fitted for the skies. And if any gude mon can be found who doesn't add his mite to make you feel discouraged on such days I propose that he be carefully rolled in pink silk paper, then put in a glass case, and sent to the Panama Exposition.

MRS. VAN.

The Lame Housekeeper.

THIS is a dinner served recently, the work done without leaving my seat, a one-burner oil stove on one corner of the built-in kitchen cabinet. Our pantry workroom is smaller and more convenient by far than any I have ever seen described anywhere. We had boiled potatoes, boiled eggs 'carefully washed and put in with the potatoes at the last minute' lettuce, cold coffee, fresh rolls and apple pie. I had to have some one set and clear the table for me, but can manage the dishes, sitting down. For convenience to a lame person, Sister has found for me a really practical and inexpensive alcohol iron. Four bakers drive by here daily, and by buying the food fresh it seems wholesome. One man has food as good as we can bake at home. This is about the only labor-saving thing that comes to one's door in the country. The other is the opportunity to send one's flat wash to the laundry at a very reasonable rate, they wear it out rapidly, though.

E. S. K.



ONE OF THE DINING ROOMS AT THE LINCOLNDALE SCHOOL.

Destroying Black Ants.

How can I eradicate black ants from the house? I know of an ant hill not far away. R. D. U.
Pennsylvania.

If these ants come from the ant hill punch a hole with a crowbar down into it about two feet deep. Pour in half pint of bi-sulphide of carbon and immediately cover with a thick blanket—all over the ant hill. This liquid evaporates and forms a poisonous gas—death to all breathing things—which will penetrate through the "hill" and kill the ants.

Winter and Summer Screens.

I keep two sets of window screens, one that I have tacked cloth over, that I keep in the bedroom windows all Winter, even in zero weather; these I am just putting away for the Summer screen. F. W.

Your idea of cloth screens for the bedroom windows in Winter is a splendid one where a person cannot quite bear to have fully opened windows. If the cloth is sufficiently thin, with open mesh, considerable fresh air is secured without drafts. The idea of open windows in the sleeping room is fast gaining ground, and a screened window may be considered a semi-opened one. To one who becomes accustomed to plenty of fresh air at night, closed windows produce a feeling of intolerable stuffiness.

Thinning Peanut Butter.

Could you tell me whether there is any way to thin peanut butter that has become too dry? F. W.

Peanut butter may be thinned for table use by the addition of a little warm water, with, or without, the addition of salt, as desired. The writer much prefers peanut butter that has been thinned and salted in this way to the pure article, and it goes further with the children.

M. B. D.

Summer Milk and Egg Dishes.

WHILE the hens and cows are busy, with brimming pails and crowded nests "June Meals" are in order. Here are a few samples from the Wisconsin farmers' institute:

Cake Custard.—To use up any kind of layer or plain stale cake, crumble it with the hands into a dish; if you have two cups of crumbs, take juice of one lemon, add sugar and three-fourths of a cup of hot water, make rather sweet; when cold pour over cake. Make a custard with two eggs, one tablespoon corn starch and one pint of milk; cool, then pour over cake. Any kind of nuts chopped and sprinkled over the top is an improvement.

Milk Sherbet.—Four cups milk; juice of three lemons; 1½ cups sugar. Mix juice and sugar, stirring constantly while slowly adding milk; if added too rapidly mixture will have a curdled appearance, which is unsightly, but will not affect the quality of sherbet; freeze and serve.

Baked Eggs with Cream.—Scald a scant one-half cup thin cream or rich milk; break in three eggs, sprinkle a few grains of salt over the whites; set the dish in a pan of hot water and bake in a moderate oven. When the eggs begin to set, sprinkle with grated cheese and return to the oven to finish cooking.

A LAYER-CAKE SUGGESTION.—When layer cakes are taken from the oven, if turned upside down on a cloth and a damp cloth placed over them, they usually drop out unaided. MRS. F. W.

No Place Like Home.

We are all interested in knowing how "the other half lives." Dr. M. C. Tanquay of the Kansas Agricultural College is now in Crocker Land, that vast unexplored region in the Far North. A letter recently came from him—brought by Eskimos to the Greenland coast and sent by way of Denmark. The story of housekeeping in the snow will interest some of our people who find the temperature far above the melting point.

All members of the expedition are in good health and are having a wonderful time. I haven't even had a cold since we came. We are living in a large and comfortable house which we built last Fall. The main room is 18 feet by 20 feet. The room, in which Mr. Ekblaw and I live, is eight feet by 10 feet. He and I had a snow house built just outside in which we sleep part of the time, in our reindeer sleeping bags that the Eskimo women have made for us. The Eskimo women do all our sewing and they are good at it, too. One night my Eskimo and I stayed with a family composed of the man, his wife, and four children, the oldest being a girl of 14. They lived as most of these Eskimos do in Winter, in a rock igloo, which is something like a Kansas cyclone cellar. To get inside, you crawl on your hands and knees through a dark narrow passage, 20 to 30 feet in length. This ends in the igloo proper, which in this case was not larger than eight by 10 feet and scarcely high enough to stand in. You always encounter at least half a dozen dogs in the dark passageway. The fact that I stopped there overnight, being one of eight people in the room, that I didn't mind it in the least, that I slept well, that, if I did not relish it, I at least ate their raw meat for breakfast, tells you how near I am now to being a real Eskimo.

What They Say About It.

YOUR woman's department of May 30 was an extraordinary fine feast. Though only a poor masculine being I was as much interested in it as any could be, I think. J. F. CASS.
Washington.

I should be glad to help ever so little in making the magazine number, for I enjoy it very much. The new department, however, is all right. Women like to be entertained as well as "uplifted."
New York. MRS. ETHEL D. MCNICKLE.

I congratulate you on the great improvement of the Woman and Home Department. You have certainly made a very liberal advancement, for which the women will be pleased and give a generous patronage. A. M. H.
Ohio.

I agree with the subscriber who said it was worth every penny of two dollars instead of one. So here goes to back it up. I am much pleased with the new edition of Woman and Home that we receive once a month. It did seem that THE R. N.-Y. was only to be of interest to the men. But now, as it is, mother and daughter want it also, for the new edition has made it of interest to them also. MRS. FRED LE BRENZ.
Minnesota.

I sent you two subscriptions (trial) for the Ohio State Penitentiary, thinking it might help some poor creature when he should be liberated. Now the Governor, acting with the authorities, has provided a 1,500-acre farm, and men are there from the "pen"—trusties, etc., caring for cattle and crops. No bars, no walls! Their hearts are touched.
Cincinnati, O. W. M. A.

My wife was very much pleased with the ladies' hand bag you sent me. She did not expect it to be half as good as it is. Any time I can put in a good word for THE R. N.-Y. you can depend upon me doing it. LEWIS MYLES.
Texas.

What I like about this monthly women's number is that we can tell what we want discussed or talked about. Somehow most of the magazines I see appear to be conducted by people who never lived in the country at all. Farm women need some chance to earn a little money of their own to spend as they please. Show us how to earn it. MRS. J. C.
New York.

I am so glad we are to have a chance to help in this new Woman and Home. Farm women are just like other women. They do not like to be patronized. Naturally we resent having some city woman come and tell us about housekeeping when she could not possibly step into our home and hold it together economically.
Indiana. MRS. S. B. J.

I like the new magazine edition very much. I am glad you are discussing some of the house pets, for only those who have tried it can know what a bright little canary means to a lonely farm woman. MRS. H. G. K.
New Jersey.

We are just two old folks, never had children. We came here 13 years ago as old folks. This was new land, had been pinery, so we had the old stumps and windfalls. We had been in North Dakota as homesteaders; that is why I think that story in THE R. N.-Y. is just like old times. MRS. S. K. K.
Wisconsin.

Business For Women

Making Use of Parcel Post

Markets in Suburban Towns.

GOOD markets for parcel post trade for farm women that I have not heard mentioned, or rather I should say emphasized, are the suburbs of large cities. The conditions are radically different in regard to foodstuffs than what it is in the city proper in most cases.

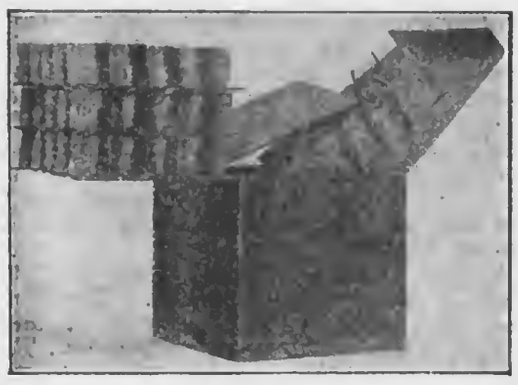
Very often there are only one or two grocers, sometimes only one butcher, and no bakery; consequently the prices of everything are higher than in the city where the same class of people live. The reasons for this are two; first they have extra cartage to pay, and secondly, as there is practically no competition, they put the prices of everything away up, and of course the people have to pay. Now if the farm women will raise more chickens and eggs it seems to me they could develop a fine trade, not only in chickens raw, but cooked chicken ready to be used for salad, sandwiches, etc. Then, outside of sending eggs in their natural state, there are certain kinds of cake and puddings and pastry that would stand shipment well. For instance, lady fingers, pound cake, molasses and spice cakes, etc., in fact any cakes that did not have a soft icing. And anyone who had butternuts or walnuts could make those delicious nut loaf cakes that everyone loves. Then there are several kinds of pastry and puddings for which I will gladly send the recipes on request.

Perhaps at first until a trade was established the grocer in the place could be asked to handle the goods, but in every case I would have the cakes wrapped in paraffin paper. Then in each package I would place a postal card (without the stamp) printed with the prices and names of things you have for sale, leaving space for the customer to indicate what articles they wanted to order. In a short time a direct trade could be established. Of course the quality of everything would have to be first-class and the prices reasonable. It would be better to have certain days for certain things, and sufficient variety from week to week, so that people would not get tired of the things. Here would be a good chance for farm and village women to coöperate—each taking the thing to make that they could do best, for very often a good pastry maker is not a good cake maker. Also one person would not be able to handle a trade like this after it was once started.

MRS. FLORENCE BELLE.

Mailing Packages for Eggs.

THE Department of Agriculture has issued Farmers' Bulletin No. 594 on shipping eggs by parcel post. This gives a full discussion of this interesting problem, takes up the care of the egg from the hen, tells how to use water glass, and other methods of preserving eggs, and then gives very full directions for shipping eggs and particularly handling them by parcel post. The arrangement of zones is given and full directions for handling, shipping and selling. It appears that in order to test the matter,



PACKAGE FOR 10 DOZEN EGGS.

9,131 eggs were sent through the mail in 466 shipments. The total breakage was 327 eggs, of which only 209 were so badly broken that they were beyond use. Of these 91 eggs were broken because the parcel was not properly handled. This shows the small loss resulting when eggs are properly handled and properly packed. Of course eggs with thin shells and out of the proper shape should not be used. Each egg is wrapped in sufficient paper to hold it tight in its own compartment and the package must be securely and strongly packed and tight. The department gives pictures of two containers which have operated well. Cut below shows the size which carried ten dozen, the eggs being placed in four layers of 30 each. Cut at right shows a compartment made of fibre board fitted with corrugated pasteboard lining and fillers. This size holds 15 eggs and has carried its contents securely. Anyone interested in the shipment of eggs by parcel post should by all means obtain this pamphlet and make a thorough study of it. Most people who report to us state that their first shipments were not very satisfactory as many were broken. In most cases where they continued to handle the eggs in this way and to study out the matter carefully, they have been able to improve greatly and most of them who studied up the proposition are now using the system with profit.

Rompers by Parcels Post.

I WOULD like to suggest to Mrs. E. S., page 637, that perhaps she could make money by taking orders for and making rompers for children from two to six years of age, according to the pattern shown in your issue of May 2, page 674. If she lives near a village or town perhaps she could get enough local orders to keep her busy. If not, a little advertising in THE R. N.-Y. and parcel post would solve the market problem. I would suggest that the rompers be made of dark blue and white ripplette (seersucker) as these would be easy to wash and require no ironing. If so requested the small size could be made to open at the bottom seam (inside from knee to knee) using buttons the same as on the back of the romper. I feel sure a good many mothers with young children would gladly buy these rompers, as they mean a great saving in the amount of washing necessary, because they protect the underwear and keep it clean. Some very well-to-do people I know keep their children in rompers all the time until they are five or six years old, having one or two of the white ripplette when they want them to look a little better than usual and generally one pique or heavy linen for very best. For Winter use they could be made of gray or blue Scotch flannel. The ripplette could be purchased by the piece, which would give a large profit. In soliciting orders I would suggest that the chest measure, also length of arm and length from base of neck to knee be asked for, as well as age of child, because there is quite a difference in patterns, and of course the mothers would not want to alter the rompers after they got them. MRS. F. B. T.

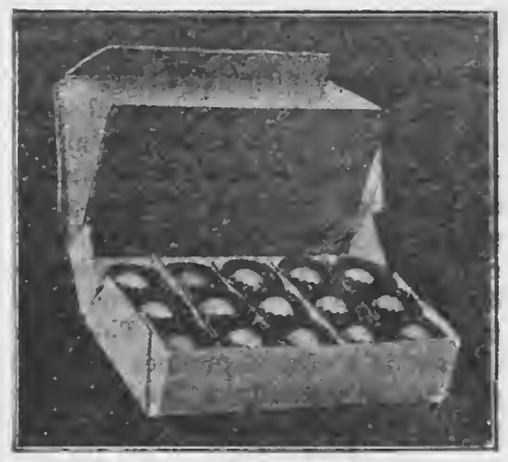
Shipping Eggs by Parcel Post.

I READ with interest the article on parcel post, on page 636, and likewise the letter of Mrs. P. T. R. on page 764, in which she tells of her trouble in shipping eggs by parcel post. In the interest of people who hope to get more than a 35-cent dollar through the medium of the parcel post, I would like to contribute my experience and a few thoughts on the subject.

I have been shipping eggs by parcel post to private customers since last November, during which time I had one egg broken, and which was my own fault. I get my customers by advertising in the Sunday papers. I am now getting 35 cents a dozen net for the eggs I ship, the customer paying the postage and cartons. In other words I get 41 cents a dozen for eggs shipped, six cents of which is for postage. Thirty-five cents a dozen is the lowest price I have reached this Summer. I felt sorry for Mrs. P. T. R., who seems to have had hard luck in her efforts to market her eggs by parcel post. If she be a woman who knows how to be particular she should start right over again, and be determined to make a success of it. This can be done, and possibly to a better advantage to herself than in my case. Where I live I can sell my eggs for a good price at the door, which possibly she cannot.

Now for a few pointed thoughts. It is useless in my opinion to try to ship eggs by parcel post unless the person making the shippings is particular in small things. There is a way to pack, and a time to ship, and unless these precautions are observed failure is sure to follow. I do not know whether all cartons are properly made to carry eggs. The kind I use are of double corrugated paper, and the boxes so made that there are two thicknesses of corrugated board on each side of the box. Inside are the usual compartments for each egg, made of the same material.

The secret of success lies in the wrapping of the egg, before being placed in the box. My method is to wrap each egg in soft tissue paper, cut to a proper size, and then wrap it again in soft brown paper, so as to fill the compartment, and not permit it to shake. Care should be taken to have the tissue paper cut so that it can be wrapped loosely around the sides of the egg, several wraps if possible, and then fold in the paper at the ends. The object sought is to form as much cushion over the sides of the egg, but be sure that no lumps or knots of paper are formed against the sides of the egg, which are likely to cause them to break. It is the side of the egg that must be protected, rather than the ends. The object of using heavy brown paper is to form additional cushion. The tissue paper is used first for sanitary reasons, preserving the egg and keeping it nice and clean. It is not sufficient to guarantee carrying without breakage. Paper is not all alike in its properties. A harsh brown paper does not make a good cushion for the egg to rest in. Use a soft paper, and wrap it loosely, and the egg will withstand the ordinary jarring it receives in transit. The eggs, of course, are placed in the box on ends. Eggs packed in this manner can go anywhere. I have taken a box of eggs and thrown them across the room to test out and failed to break any. I tried to pack them wrapped in tissue paper only, but stopped that practice when I found that an egg was broken in the second



MAILING PACKAGE FOR 15 EGGS.

lot sent out under such methods of packing. I have sent them from Philadelphia to Charlotte, N. C., and to Atlanta, Ga., all of which reached the destination safely. I shipped to my customers during the holiday rush and during the blizzard weather last Winter, and never lost an egg.

I ship Mondays and Thursdays, which gives deliveries in good time. Shipments collected Friday afternoon cannot be expected to reach the customer in the distant city until the following Monday. They should be started Thursday morning to make sure delivery. I have a record of all my shipments, having started the parcel post delivery method with a view of making the experiment. I expect to increase my egg output this Fall, and will follow the idea of advertising for parcel post customers. I am not interested in reducing the high cost of living, and do not believe that the parcel post is a factor in that direction, at least so far as eggs are concerned. It is a factor, however, to the city people in the reduction of the cost of high living. Anyone who has a poultry plant situated as the one described by Mrs. P. T. R., if they use good judgment, and care in packing, can beat the 35-cent dollar to a standstill. Such has been my experience from the seven months' trial of shipping eggs by parcel post. E. H. R.

Management of Work and Children

AS a question for discussion next month we may take the following letter. This will appeal to many a mother who finds it hard to get time for anything outside of housework:

The Woman and Home Department is fine. You ask us to tell you what we would like to see discussed in this department. Will not the mothers who have families of little ones, not one or two, but like myself, four or five, write and tell us how they manage their work or what system they use to get it done, as mine seems never done? I am sure it would help many farm mothers, beside myself, who are trying to do their work, take care of the children and help in the garden and poultry yard.

New York. MRS. W. B.

Principles of Home Management

Just now the farm thinkers and instructors are talking most about "efficiency" and "farm management." Some excellent advice is given, but mostly by people who are not obliged to practice their own preaching in order to make a living. Management of the home is just as important as that of the farm. We prefer advice and experience from women who day by day face the conditions suggested by Mrs. W. B. in the above letter. The farm mother who can keep her home, care for a family of children and save a little time for herself is a manager of high skill, and we want to know how she does it.

PEOPLE who are interested in children's industrial contests should read *The Extension*, published at the North Dakota Agricultural College, Fargo, N. D. No. 6 of this publication is called the "Industrial Extension Number," and contains rules for conducting contests with score cards, etc.

"ARE your friend's habits abstemious?" "Oh, no, sir, not a bit of it! He never takes a drop."—Baltimore American.

∴ The Patent Churn ∴

(*Continued from page 859.*)

to the relief of the agent at the churn. No sooner were they out of sight than off came the churn lid and an inquiring finger plunged inside. Lifting his dripping finger to his lips the agent tasted, his face reddened and he gave the churn a vicious kick sending its contents splattering. Ten minutes the company lingered at the flower bed. Suddenly a rig passed the house going toward town at a lively clip.

"Hey, what's yer hurry," hailed the man who had addressed the agent before. But the agent did not answer. Instead he urged the horse to a faster pace and the assembled neighbors caught sight of the patent churn dancing a mad jig behind the high seat and a moment later all was hidden by an enveloping dust cloud.

"Oh, Mrs. Hays, that scamp has run off with your butter," exclaimed one of the ladies as they turned the corner of the house. At this the neighbor who had hailed the agent laughed uproariously.

"Oh no he didn't," laughed Mrs. Hays. "I churned this morning; the butter's down cellar; he was churning on buttermilk."

Making Ice Cream

Fat of the Farm in Cool Comfort

By Bertha Betts

WHAT IT IS.—That which was a luxury has become the almost everyday food of all classes, poor as well as rich. There are two general classes of ice cream: Plain or Philadelphia, or New York, and French or Neapolitan. The plain ice cream is a raw product made simply of cream of varying fat content, sugar and flavoring. Commercially it generally contains some binder, but it rarely contains eggs. The French ice cream is a cooked product containing eggs, and is virtually a frozen custard. Ice cream is not generally considered a food, although its food value is rather high. It is mostly eaten for pleasure and considered a treat. Since it is eaten for this reason it is essential that flavor be made the first consideration. The choice of the kind of flavor is decidedly an individual privilege, but no matter what flavor may be chosen there are certain definite factors which may make or mar the character of the finished product. To obtain the best flavor the following factors must be considered:

1. The purity of the cream, whether free from all contamination and dirty odors as are likely to be collected in dirty stables or unsanitary methods of storage.

2. The richness of the cream; Cream with a high fat content possesses a decidedly better flavor than does a cream of low fat content.

3. The sanitary condition of the freezer can; it should be carefully washed, rinsed and aired before using.

4. Ripening; if ice cream is allowed to stand for several hours after freezing the flavors become more thoroughly blended.

5. A small amount of salt will help to bring out and enrich the flavor, but it must be added with care, one-eighth teaspoon per quart is about right.

BODY AND TEXTURE.—Next consider body and texture. These terms are often used synonymously but mean quite different things. When speaking of body we mean the whole mass as a unit, while texture means the arrangement of particles. The body should be firm, not mushy, nor on the other hand, rubbery. This characteristic is governed in part by the milk solids present. If cream is allowed to age, say 24 to 48 hours, keeping cool the while, it improves the body of the ice cream produced. Some substances known as fillers are used to produce a better body. Evaporated milk used with thin cream is quite effective, and far cheaper than butterfat in sufficient amount to produce a like result. Gelatin is frequently used, especially when the ice cream is to be kept for a considerable time. It decidedly aids its keeping quality. Flour, cornstarch and rennet are also often used; these make a pudding-like mixture which give a firm body.

SMOOTHNESS.—If the ice cream has a smooth and velvety texture it is far more pleasing than is a mass of coarse crystals. This characteristic is also largely influenced by the presence of butterfat, but the method of freezing is quite as important, for if ice cream is frozen too rapidly the cream will separate and coarse water crystals will result. Or if frozen without motion it will be coarse grained and spiny. During the process of freezing it is essential that enough air be whipped into the mixture to give it a light, smooth and yet velvety consistency. Of course the more butterfat present in the cream the more velvety will be the texture of the resulting ice cream, and the less will be the necessity for incorporating air. If the cream is whipped before mixing with the flavoring it may be allowed to freeze without stirring and a very desirable result be obtained. This type of frozen mixture is generally known as mousse. For very cold weather, when the mercury remains well below the freezing point during the day, such a mixture can be made at night, set out-of-doors and be in excellent condition to serve for dessert at dinner the following day. If ice cream is to be kept for some time, a binder such as gelatine, ice cream powders, etc., may be used to hold the texture and prevent the growth of water crystals.

EFFECT OF STIRRING.—As ice cream is freezing its volume increases. This is due to the incorporation of air into the mixture and to the expansion due to freezing, and is known as "*swell.*" If a viscous cream is used more air can be whipped into it. The viscosity of cream increases on holding; just why this is does not seem to be clearly known. One theory of this thickening phenomena likens it to the clotting of blood. The amount of swell is greatest just before the mixture freezes. If the ice cream is frozen slowly there is more time for whipping between the time when the cream becomes cool enough to whip and the time when it freezes. Thus, more air will be incorporated and a larger swell obtained. If the freezing is done too rapidly at first the cream will be liable to churn before it becomes sufficiently cool to whip and swell. Thus it is best to freeze slowly until the cream is cooled to the whipping point (about 34 deg. Fhr.) then to increase the speed of the dasher, reducing the speed again when it begins to thicken so as to prevent any possible loss of swell.

FREEZING.—To freeze ice cream, a mixture of ice and salt is used. The salt hastens the melting of the ice. When the ice melts it must absorb heat so it obtains this heat wherever possible, and this comes principally from the mixture in the freezer can. Thus the cream-sugar mixture loses its heat and becomes ice cream. A fine salt works more quickly than does a coarse salt, but it tends to form crusts and prevent the ice from settling about the freezer can. Added to that it is much more expensive than coarse salt, so the latter is generally used. The ice should be broken fine and, if the freezer is a large one, a little water poured over ice and salt at the start will hasten the freezing. Most directions given for the proportions of ice and salt call for three parts ice to one of salt. This is necessary for mixtures frozen without stirring, but for the average ice cream, frozen with stirring, much less salt can be used (say 10 parts ice to one part salt) provided the salt is not put into the freezer until it has been packed three-fourths full of ice. By so doing much less salt settles to the bottom of the freezer. When the freezer is emptied the undisolved salt can be drained, allowed to dry and used another time.

NEAPOLITAN ICE CREAM is generally made with thin cream or rich milk and six to 12 egg yolks per quart of liquid. One cup of sugar is allowed for each quart of liquid and another cup of sugar for each dozen of egg yolks used. This mixture is cooked exactly like a boiled custard, allowed to cool, flavoring added and then frozen.

PLAIN ICE CREAM is made of thick cream and sugar flavored as desired. For each quart of cream use three-quarters of a cup of sugar. If crushed fruit or fruit juice is used for flavor do not mix it with the cream before beginning to freeze. Put the cream into the freezer can and turn until it just begins to freeze, then open the can, add the fruit juice, made into a syrup with the sugar, and continue freezing until as stiff as desired.

Formula for plain ice cream made with fillers and binders: For one gallon of ice cream, cream two quarts; scalded milk one quart; filler three tablespoons flour or 1½ tablespoons cornstarch or one junket tablet, or ¾ tablespoon gelatin; cream one quart, scalded milk two quarts, one-quarter cup flour or two tablespoons cornstarch or two junket tablets or 1½ teaspoons gelatin.

For one gallon of ice cream use three cups of sugar and any flavoring desired.

The Bright Side of Life

THE best way to cure the "blues" in your own life is to make the life of some other fellow a little more rosy!

Mother's Afternoon Out.

Mother was at the mending basket.

Twins: "Mother! We've grown up!"

Mother (looking up at her tall daughters): "So I perceive."

AN INDIAN WOMAN AND HER BEAD WORK.

Twins: "We've been doing some real thinking and we've talked with Dad."

Bab: "You've been wearing all the old clothes and working hard and staying at home and it isn't fair."

Betty: "Every hired girl in town has two afternoons out and you haven't any time to yourself. This won't do, this family is going to reform."

Mother (meekly): "Yes, daughters. Honorably deign to mention how I am to reform." (Both girls hug her violently.)

Bab: "You don't need to reform but we do."

Betty: "We're going to give you two afternoons a week to do as you like."

Mother: "But you are busy with your school and your music and your clubs."

Bab (interrupting): "What afternoons do you want?"

Mother: "Wednesday is Ladies' Aid. I'd like to have that and Sunday so I can go home."

Father (entering): "All settled, girls?"

Mother: "Are you in this, Max?"

Father: "Yes, Mary, I am."

Mother: "With the whole family against me, I may as well yield. But what will you do about the meals?"

Father: "Oh, we can eat crackers and milk."

Twins: "We'll find something you know we can cook."

Bab (aside) "Who put ground coffee in the coffee cake?"

Betty (aside): "Who left the sugar out of the cranberry pie?"

Mother: "I'll trust you both to do better next time. Only at first I shan't know what to do with my free time. I've forgotten how to play."

Twins: "We'll teach you. Begin now, go for a walk with Dad, you look all right." (The mother rises slowly and goes with her husband. E. S. K.

An old man, bent and weather beaten, came to my door the other day asking for apple suckers to plant on his place. "But," I said, "it will be ten or fifteen years before those suckers bring fruit. You have no children and surely you do not expect to be here when they bear, so why do you plant them?"

"I'm plantin' 'em for posterity," he replied.

"But what did posterity ever do for you?" I asked.

"It's never had a chance, so I aim to do by it as I would wish it to do by me; if I was posterity an' it was me. If *somebody* hadn't done somethin' for posterity, I'd have been nigh 20 year old 'fore I'd tasted a Limbertwig." C. R.

North Carolina.

FARMER JONES, over the fence: "Does your cow give a lot of milk?"

Farmer Town, lately from the city: "Well, I think she would give a lot, but my wife and I agreed we would be saving of it, and I only milk a pint or a quart, or just what we want to use, so there won't be any wasted.

THE CORRECT SIZE.—Mrs. Newlywed fluttered into a high-class furnishing store and asked to be shown the latest styles in men's Spring hats.

"What size?" inquired the practical clerk.

"Eight and one-half."

"That's a rather unusual size, are you quite certain of it, madam?"

"Very certain. I heard my husband order shoes yesterday, and remember distinctly. Yes. Eight and one-half."

E. D. M.

You would have been amused could you have heard Mr. F. and I rise to the occasion recently upon being asked what was the best farm magazines. In chorus we exclaimed, "There is only one farm magazine." We made the inquirer write down name and address, and had I had a pistol about me, I should have seen that the subscription got off at once. J. D. F.

Carrying a pistol in New York State is against the law unless you have a license. No doubt the court would quickly issue a license for this worthy purpose, but how long would such readers stick? "Buying by sample" beats a shotgun.

ANOTHER HAIR RESTORER STORY.—The little hair-restorer story on page 769 of THE R. N.-Y., reminded me of a story I heard not long ago, the truthfulness of which the narrator was willing to vouch for, ran thus: Into the town of L——, came two men, William and James Selby, who rented a house and established themselves therein. It was soon discovered they were both perfectly bald, a fact that seemed to annoy them very much. They soon had the heart-felt sympathy of the whole town. One day an agent *chanced* to invade that town offering for sale a wonderful hair-restorer. He called on Sam Perkins who was slightly bald and failing to convince him of the wonderful powers of the specific asked: "Do you know of any one who might be in need of my remedy?" "There are two men in the house next door, you might call on them." replied Sam. Sam saw the Selby's later. They thanked him for sending the agent to them saying they were giving the medicine a fair trial and had great faith in it. "See," they said proudly showing their heads on which there was a fine growth of hair already in evidence. In a short time the demand for that particular compound was immense. Then one day it was discovered that the agent was a brother of the Selby's and that they had kept their heads closely shaved ever since they had moved to L——, and after buying the tonic had laid their razors away and simply let the hair grow. The demand for hair-restorer became a thing of the past.

M. B. DUTTON.

Indian Bead Work.

THE accompanying picture may serve to inspire women readers of THE R. N.-Y. to try their hand at bead work in forming saddle and bridle trimmings. Doubtless many patrons of the movies who sit and watch long reels of horseriding films have noticed some of the gorgeous designs that have been wrought in beads. It is safe to say that most of the work was done by the Indian women, but her pale-faced sister already has learned to indicate the red maiden closely. Indian girls who became students at the Indian schools carried this knowledge of bead work along with them. Many of them decorated their rooms at the schools with work of this kind, and some of them willingly gave lessons to white girls, with the result that such work is being done outside of the Indian reservations more than in earlier days.

Indian women charge more for this kind of work than formerly. The time was that such work was sold at such trivial prices as to seem ridiculous. The work was gobbled up as travel to the Indian country increased, and then the red workers began raising their prices, and in some instances they have soared almost out of reach. It used to be that the Indians made a water bottle that was considered a piece of real potter's art, and they were useful as well as ornamental. But water bottles doubled and trebled in prices until they reached fancy figures. And then the workers are said to have skimped their work until a water bottle wouldn't hold water or anything else that was poured into it.

J. L. GRAFF.

Unusual Farm Problems

What Can Be Done

THE R. N.-Y. is closer to its readers than any other paper in the country. We make that statement without reserve after having for years read the thousands of letters which come to us from troubled and puzzled readers. Most of these questions can be answered by individuals. There are others which require a discussion or a wider experience than any one person can give. We cannot print all such questions, but now and then there comes one covering a new line of thought, and we print it to develop a discussion.

A Prisoner as a Farm Hand.

I am interested in a man who is now in jail—soon to be set free. He is a highly educated man of naturally good character. When he is set free this man wants a place on some farm where he can work and learn fruit growing and poultry keeping, and thus make a new start. I am satisfied that he is sincere in this, and that if he could find such a place, removed from the temptation of drink, that he would do well. There ought to be a chance for such men to get a new hold on life. Do you know of anyone who would take him? W. A.

We do not. It is a hard case, for such a man ought to have his chance, but most people who live on lonely farms would be afraid of this record.

The Right Man Wanted.

I have a farm in a Southern State which I have tried for some time to handle satisfactorily by proxy. The natives are not very energetic and I have had one or two tenants who took little interest. Like many other land owners, I most desire to have the place kept up and pay expenses. Many of us think we have opportunities for middle-aged Northern people who would like a change of climate, but we do not know how to reach such people. R. H.

Schoolboys Want Work.

A number of the boys in our city school would like to work on farms this Summer—to earn something and learn practical farming. Where would they be most likely to find such employment? Are not farmers desirous of obtaining such help? CITY TEACHER.

Our experience is that most practical farmers do not desire this kind of help. It would be hard to place these boys on farms where they could really learn much about farming and be worth much more than their board. We know that some city people imagine these young men would relieve the labor situation, but as a rule they barely earn their board. There ought to be places where such boys could learn, but they must pay for other forms of knowledge.

A Home With Childless People.

I have been reading the letter of the lady with the two girls and $400, and I saw the answers in THE R. N.-Y. from the people. I have $500 and am alone. I would like to make myself a home in country too. I am not for sale in the marriage line. My age is 33. I would like to make my home with an old childless couple living on a farm, Christian people wanted; can furnish good recommendation. I will go South or West.
Pennsylvania. C. A. D.

We have had several letters from elderly people who would like a companion. No doubt there are others like the sensible woman who writes this note. The problem is to bring the two together and have them satisfied, yet if this could be done many a worthy person could find a home and many a farm home could be kept going.

Let Women Vote.

I FIND on page 773 an item on women voting, by W. L., which is headed "A Man's Sensible Opinion," but I fail to see the sense, if by sense is meant a reasonable argument. The writer says he is opposed to woman suffrage, but if it can be shown that a majority of women want to vote he will withdraw opposition and help them; also that he should consider it an outrageous injustice to compel them to do that which they do not want to do, because a minority want it done. Woman suffrage is either a good or a bad thing. If a good thing, then any woman who wants the privilege ought to have it. If it is bad numbers cannot make it good, only add to the evil. I do not understand that the extension of the election franchise to men ever depended upon proof that a majority of men wanted it. It was claimed to be a good and just thing to grant the privilege to those who wanted it, but *no one is compelled to vote if he does not want to do so.* All the women suffragists ask is that *those women who want to vote shall have the privilege.* The talk about compulsion is all *bosh.*
Massachusetts. MONROE MORSE.

BELLE OF THE BALL.—The little picture herewith, taken from the Chicago Tribune, comes near the political truth. Illinois women have the ballot. At the ball she is overrun by

BELLE OF THE BALL.

suitors—politicians who want her vote. Miss Ohio and her sisters Iowa, Michigan and the rest are wall flowers—no one paying attention to them.

The Woman At Law

[Under this heading we shall discuss the legal rights of women, particularly as regards thier property and their children. There will be direct answers to actual questions and general statements of law.]

Selling Property Without Wife's Consent.

My husband sold some property a year ago without my consent, even though I had several hundreds invested in it. I have not learned any particulars about same and do not know what he got for it; he never tried to settle up my share nor have I seen one cent of it. He has left us now and also three minor children dependent upon strangers or my own people. Is there not a dower right after 10 years of married life, so that a wife should be entitled to a little? A. H.
Connecticut.

If you were married since 1877 you have no dower right in your husband's property, nor does he acquire a right of courtesy in yours, and neither must join in the deeds of the other. Although you have no dower right in the land sold by your husband and have no claim against the buyer, you would have the claim, of course, against your husband for the amount you contribute toward it.

Will as to Joint Property.

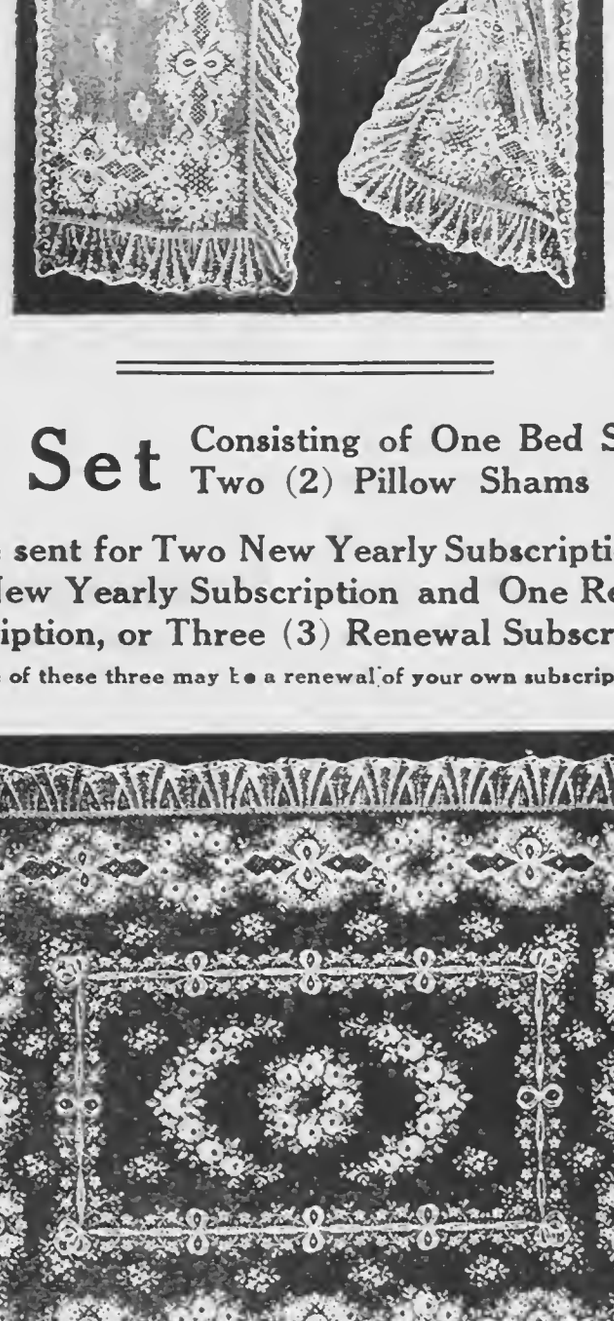
The deed to our property is a joint one, myself and wife, our savings bank account is a joint one, payable to either of us in case of death, my insurance policies are made out to my wife, our household furniture and personal effects are worth $1,000, free from debt. Is it necessary for me to have a will? Being fixed as it is would it be necessary for my wife to go through any process of law to hold this property? Will you give me the exact law on this question? G. B.
New York.

It does not seem necessary that you should have a will if you are sure that all the property of any value that you have is in the joint names of yourself and wife. This would seem to be the case with all the property you name except the household furniture, and it would be well in regard to this to give your wife a bill of sale, which, there being no creditors, you may do. This would take the form of a gift, and may legally and properly be done. Where there are no large creditors and no general active business is being done the procedure you have outlined above is a good one for a man and wife to pursue in regard to the disposition of their property, and in case of your death there is nothing your wife would have to do to retain possession of the property.

This Fine Saxony Net Split Lace Curtain With Throw-Over Top

will be sent for Two New Yearly Subscriptions, or One New Yearly and One Renewal Subscription, or Three Renewal Subscriptions

(One of these three may be a renewal of your own subscription)

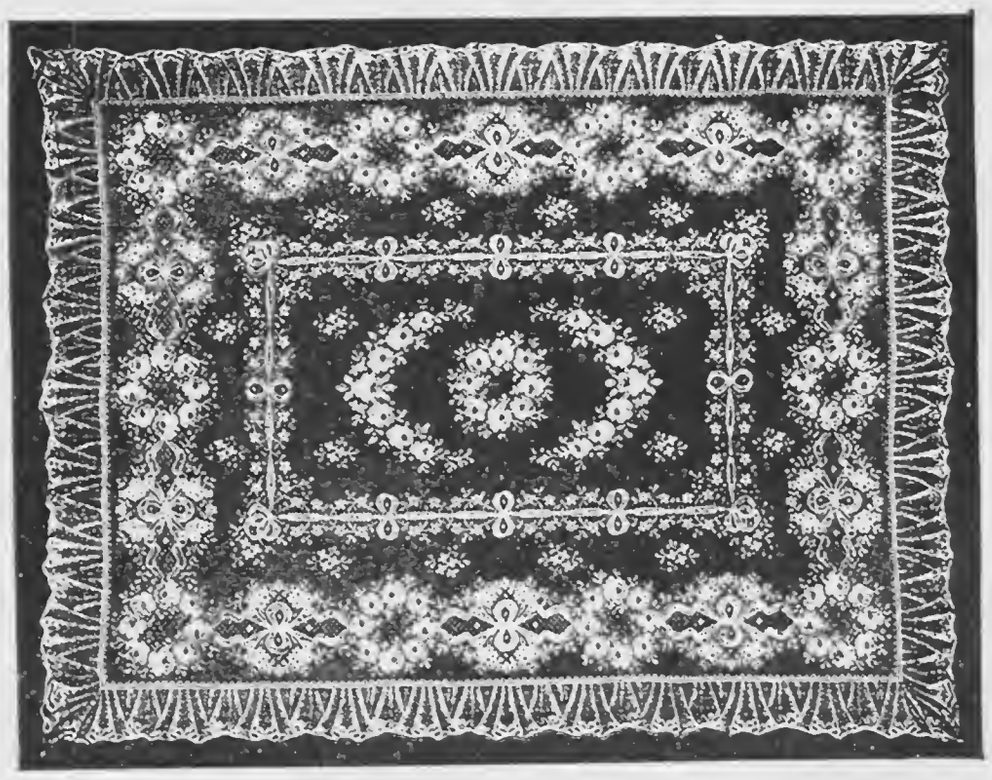


The design is known as the Brussels and Bow Knot. Size: 3 yards long, 60 inches wide. Throw-Over at top, 36 inches. The curtain is one piece, but presents the effect of a pair of curtains when draped. The curtains are of good material, well made, overlocked edge and will stand washing well.

Bed Set Consisting of One Bed Spread and Two (2) Pillow Shams . . .

will be sent for Two New Yearly Subscriptions, or One New Yearly Subscription and One Renewal Subscription, or Three (3) Renewal Subscriptions

(One of these three may be a renewal of your own subscription)



This Bed Set is of Saxony Net Lace, the Spread is 72 inches by 92 inches, the Two Pillow Shams are 36 inches square. The design is the famous Brussels and Bow Knot. The set is of good material, well made, overlocked edge and will wash well. The design matches the curtain.

A Complete Room Set of Curtain and Bed Set

above described, will be sent for Three New Yearly Subscriptions or Six (6) Renewal Subscriptions

(One of the six may be a renewal of your own subscription)

THE RURAL NEW-YORKER, 333 WEST 30TH ST., NEW YORK

Live Stock and Dairy

DAIRY CATTLE IN KANSAS.

[Newspaper reports have mentioned a development of the dairy business in Kansas—coöperative buying and breeding of improved stock. The following statement by Prof. A. T. Neale tells about it.]

I DO not know that we are doing anything new or startling here in Kansas, along the lines you mention. Kansas, as you know, has not been a dairy State. The industry is developing very rapidly, however, at the present time, and we are endeavoring to assist in a rational development. We are endeavoring to create community breeding centers in which only one breed of dairy cattle is kept. We have several of these started now, that will be heard from later on. At Mulvane we have the largest Holstein breeding community west of the Missouri River. The farmers there started breeding Holsteins about four years ago. A year ago they organized a Holstein Breeders' Association known as the Southwest Holstein Breeders' Association. This organization has a large number of members who are breeding purebred cattle. Several very high-class bulls have been introduced into the community.

There are two pronounced Jersey centers established, a few Guernsey centers, and in addition to Mulvane, several other places are starting the breeding of Holsteins. We have given assistance to a large number of farmers in the purchasing of purebred and grade dairy cattle. I have just returned from a trip to Wisconsin with a number of farmers in which 100 head of Guernseys and Holsteins were purchased for various parts of the State.

In purchasing stock we have insisted on buying a few high-class cattle rather than a large number of inferior grades. These have proven to be profitable in practically every case, and have served as an impetus to the business. I am hardly able to say just how many cattle we have assisted in buying altogether. As an example of the class of cattle which we have bought, I might say that our last shipment from Wisconsin includes a Holstein bull whose dam and sire's dam average 21,000 pounds of milk and 975 pounds butter each per year, semi-official record. This bull was purchased at a long price, but goes into a community where the Holstein industry is just starting. Along with him are going several very high-class cows, some of them with seven-day official records of almost 25 pounds of butter, and as high as 580 pounds of milk. Quite a number of young cows and heifers of excellent breeding that will be able to make good records were also secured.

Among the Guernseys of our last shipment are three daughters of Rhea's King of the May, the sire of the prize-winning young herd at all the big shows of 1912 and 1913. His daughters are not only of excellent type but several of them have made around 400 pounds of fat as two-year-olds with the first calf. One of the things that we are very particular about is that all the high-class cattle brought into the State are placed in good hands. We do not care to buy cattle for a man who is a poor feeder, and will not sell to a man of that sort if we know it. By placing cattle in the hands of good men, their work speaks for itself and is a recommendation of the improved breeds.

CROP-GROWING CLUB FOR YOUNG PEOPLE.

ONE of the most helpful and interesting pieces of work a community may do for its young people is to organize a corn, potato or canning club.

Anyone who has been associated with a boys' or girls' agricultural club or contest for one season, and has seen the awakened interest among these young people knows that it is worth while. The boys and girls who join one of these contests and pledge themselves to plant, care for and harvest, by their own labor, a crop of corn or potatoes or garden truck, and at the same time keep a cost account with their crop, are better boys and girls at the end of the season. They have learned what it means to work and produce results on their own responsibility. They have seen and studied their crop as it grew. A new world is opened to them so that when they look upon a crop of growing corn or potatoes they see something besides a green mass of foliage.

It is not difficult to start a corn or potato club, or contest. Rules are made out, printed and published in the local press. Registration in the club is invited. The funds can be easily raised. The Granges, boards of trade, and even interested individuals are always willing to contribute. For prizes commodities are as useful as cash. Such prizes as purebred calves, harnesses, tools, etc., are to be preferred to cash as a rule.

The most lasting value of this class of work is the awakening and encouragement that comes to boys and girls who by their own labors have accomplished a particular piece of work. In one corn contest last year a boy 14 years of age grew 68 bushels of shelled flint corn on an acre. He won a purebred bull calf as a prize. On being advised of the fact his father remarked: "I know of no one thing that has happened in my recent life that pleased me more than this." The

WINNER OF A CORN CONTEST AND HIS PRIZE.

F. E. R.

OHIO HOLSTEIN MEETING.

THE regular meeting of the Western Reserve Holstein Breeders' Association was held May 28, at Cleveland's City Farm at Warrensville; about 200 were present. A. A. Hartshorn of New York, A. J. Glover, Prof. Oscar Erf and Dr. Colley made addresses. A basket lunch was enjoyed by those present. After an enthusiastic talk by the breeders, the meeting was called to order. It was decided to recommend G. A. Dimoc as the Association's representative at the National Board. Proxies were signed and given to those present who would attend the June meeting of the Holstein-Friesian meeting of America, in session June 1 and 2 at Chicago.

The Warrensville farm belongs to the City of Cleveland and comprises about 2,000 acres. Here is the tuberculosis tent colony, old people's home where they may live out their lives as nearly as possible among the conditions of home, the workhouse where the most unique treatment of prisoners is carried out, ministering rather to a diseased mind that needs care in setting up the right train of thinking, and the colony house. Purebred Holsteins of world-wide fame furnish milk for this great family and their beautiful surroundings are well worth going miles to see.

For some time Ohio has held the champion cow, but has not the honor at present. An effort will be made by the breeders to bring this about the coming year. In the meantime many are getting started with small herds, and still every available cow or heifer is picked up at the owner's price and at the stable, so well-known have the Holsteins of this section become. An association of this kind is a great benefit to those engaged in Holstein raising.

MRS. JAMES LAMPMAN.

LIVE STOCK NOTES.

The Ayrshire Cow.

HOW is this for cow to make the farm pay? The Ayrshire cow Yucca Douglas, 19504, gave 7,412 pounds milk as a two-year-old; three years old A. R. test, 9,045 pounds milk, 371 pounds butter; four years old, 9,739 pounds milk, 392.8 pounds butter; following freshening, 10,222 pounds milk, 403.88 pounds butter; next season, 10,994 pounds milk, 434 pounds butter. She gave 66 pounds in one day, 1,735 pounds in 30 days, under Advance Register test.

New Hampshire. CHAS. J. BELL.

R. N.-Y.—Surely the farm that would not respond to the advances of these Ayrshire ladies would hardly be worth living on.

NEARLY 450 cows, owned by 77 breeders living in 28 different counties of Wisconsin, are being tested to determine their milk and butterfat producing capabilities. According to official figures from the department of dairy tests at the College of Agriculture, University of Wisconsin, this is the largest number of cows ever under test at one time in this State. Each of the five dairy breeds popular with Wisconsin farmers are represented in the tests, 46 of the herds being Guernsey, 18 Holstein, eight Jersey, one Ayrshire, and one Brown Swiss.

ZEBU CATTLE IN BRAZIL.—Mr. P. H. Dorsett of the Department of Agriculture, writing to the Bureau of Plant Industry from Piropora, Brazil, February 8, is thus quoted in Bulletin 93:

"The Zebu cattle are good-looking animals, and have a good many points to recommend them for this country and this people. They are not, however, as I see it, strictly beef or milk cattle. But as general purpose animals in this country and under the conditions existing they appear to have many points to recommend them. The two Mr. Lomao's at Pratinha speak in the highest terms of these cattle. Mr. Pedro Lamao has a cow, 'Palinku,' that he refused 10 cantos, about $3,500, for. He sold his bull calf at weaning time for six cantos, about $3,000. This breed of cattle is praised by some and condemned by others. It no doubt has its place in this country and possibly in others."

WORK HORSE PARADE IN BOSTON.—The twelfth annual work-horse parade in Boston took place on Memorial Day, and proved to be the largest and biggest parade yet held. There were over 1,700 horses in line, and they ranged in age from an unweaned foal three months old to two champion old horses aged, respectively, 40 and 41 years. In the Old Horse Class there were 65 entries, and the gold medal was awarded to a little mare aged 34. She is owned by a family who also owned her dam, and the period of service covered by the two is 50 years. This Old Horse Class was started by the Boston Association and has proved to be a great success wherever it has been tried, and especially at county fairs. An old horse, in this sense is one who has been ten years or more in the service of the same person or concern. Other animals that figured in the parade, carried on the wagons, were dogs, goats, lambs and prize babies. Every dog received a special ribbon. Prizes were also awarded to drivers with a long term of service, and there were silver and gold badges for those who had showed the same horses for five or more years. Some interesting exhibitions of driving without reins, and of tricks by work-horses were given at the reviewing stand, and one horse went through the parade without any bridle.

H. C. M.

"Do you want a Southern exposure in this new house?" asked the architect of the railroad magnate. "I don't want any kind of exposure," answered the nervous magnate, with a shudder. "What I need principally is not an exposure, but a get-away."—Baltimore American.

Dairying in Florida.

WHILE reading your issue of June 13, I was impressed by the low price received for milk by your milk producers. Last week I made a trip around among some dairies in this county, looking at the cows and their equipment, and the prices for milk seem much higher here. One at Ocala, had been offered 40 cents per gallon for all he would produce, making a two-year contract, the milk to be delivered at a railroad depot, within two miles of the barn, but they preferred to bottle their milk and deliver to consumers in Ocala, about two miles. The farm is on the outskirts of the town, but within the corporate limits. Milk is delivered to consumers in Ocala at 12½ cents per quart and the dairyman could not supply the demand. I believe cows can be fed here as cheaply as in New York. Our good lands will produce the greater part of the feed. I shall fill my silo in July, and silage keeps just as well here as anywhere. We do not need the expensive barns and use none of our feed to generate body heat. There seems to me to be a much better profit here than in the North. Our towns and cities are growing so fast, it seems almost impossible to furnish and supply milk, cream, etc. A firm making ice cream in Jacksonville gets its cream from New York via Clyde Line boats. It can be made at less cost here than in New York. Not in all Florida land, but in any good hammock land. S. H. GAITSKILL.
Florida.

Fat Milk From Fat Cows.

I HAVE just noticed an inquiry in THE R. N.-Y. as to whether Holstein milk would be likely to pass the Massachusetts requirement of 12.15 per cent. total solids and 3.35 per cent. fat. Our herd at present consists of about two-thirds registered Holsteins and the rest high grades of the same breed. They are in all stages of lactation, and all in fair flesh. My son recently made a chemical analysis of a sample of the mixed milk from the herd and found 12.46 per cent. total solids, and 3.80 per cent. of fat.

While it is probably true that fat cannot be fed into milk, at the same time it is very certain that fat cows will give richer milk than poor cows. The way to get good milk from any cow is to keep her in good condition all the time. If one stops feeding his cows when they dry off, and they freshen in poor condition, they may give a good flow of milk at first, but it will be poor milk. Then if the owner feeds up his cows and gets them in good flesh their milk will increase in fat content. On the other hand, if the cow be fat at the time of freshening, and she is a deep milker her milk is likely to be at its richest at this time, for such cows will often milk themselves down in flesh in spite of the efforts of the herdsman to keep them up. Most of the official tests are made from fresh cows, and it is not at all unusual for these cows to test over 4 per cent. fat. J. GRANT MORSE.

Cover Crops for Pasturing.

COULD you advise me as to the best thing to sow in silage corn at last hoeing with the idea of producing some Fall feed after silage corn is taken off? This feed to be pastured off with milch cows. Soil good, well fertilized, with stable manure; usually get heavy crop corn. Turnips would be so shaded that they would not amount to anything. A discussion of best way to supply green feed to milch cows from July 15 to Oct. 1 would be interesting. This is a time of great shortage in milk every year, and a very trying time to keep up a supply of milk on account of the conditions which always exist at that time. Someone will at once suggest a Summer silo. This might do in some cases, but how about those who have no silo? E. S. L.
Connecticut.

From our own experience, without knowing more of the local conditions, we should advise a combination of rye, barley and Crimson clover, three pecks each of the two grains, and 12 pounds of Crimson clover seed to the acre. The grain will make only a light growth until the corn is cut away. Then if the soil is reasonably moist it will come on rapidly. Barley is the best grain we know of for providing Fall feed. In the South they have what is called Winter oats, which may be seeded like field grain. We have tried these in New Jersey, and found that they made a fair Fall growth, but they were all killed out through the Winter. While Crimson clover will not be likely to live through the Winter with you, if you have a moist Fall it would make fair growth for pasture, better we think than any other kinds of clover. The barley will give you a reasonable amount of pasture. We have seeded it early in September, and under favorable conditions get a fair growth of hay in late October. Rape or turnips would make considerable growth during the Fall, and would make fair pasture for sheep or hogs. We would not advise either, however, for milch cows, as they will give the milk a "turnipy" or bad taste. Probably the barley and Crimson clover in such a combination will fail to show up in Spring, but the rye will come on after Winter is over, and provide a good crop for turning under. The best way to supply grain fodder from middle July to frost, would be to sow patches of drilled fodder corn, and also Japanese millet. Make different seedings of the millet, so that it will come on in succession. There are, of course, several other crops which are recommended for this purpose, but thickly seeded fodder corn cut and carried to the cows is after all about the most economical soiling crop that can be tried in your section.

A Boy and a Cow.

THE following statement comes from the West Virginia Experiment Station:

George Sonda of Ohio County is only 12 years old, but he is feeding and milking a registered Guernsey cow during an official production test. George's father bought three Guernsey cows four years ago and with these as a start has raised a fine herd of 15 head. One of these cows, Imported Windflower III, produced 13,600 pounds of milk and 626 pounds of butterfat during an official test, as a five-year-old. A daughter of this cow, Lady Alice, at 23 months produced 12,000 pounds of milk and 600 pounds of butterfat in a year. The cow which young George is interested in is 21 months old and is now giving 35 pounds of milk, containing 4.7% butterfat, per day. He is taking full responsibility for the work and is proving himself a capable tester.

Indigestion.

I HAVE a horse 15 years old that has in the past six months seemed to get no benefit from his feed. He seems very sluggish in his movements, rough coat, his manure has very bad smell, and he seems to keep twitching his upper lip. I have given him worm remedies and seen no improvement nor sign of worms; tonics give no results. I am feeding three quarts of oats and two quarts of bran twice a day, and corn on cob once. I had his teeth filed last Fall, but it seems to make no difference. He does not seem to be shedding, and is very slow in movements. A rest seems to make no difference to him, as I have had him in the barn a week at a time, but he is just as slow and sluggish as if he is working every day. H. R.
New York.

Clip the horse, or at least clip the hair from the belly and from the legs above knees and hocks. Have a veterinarian give him a one ounce aloes ball, after feeding three bran mashes without hay. When the bowels are normal again feed a mixture of eight parts of whole oats and one part of wheat bran, allowing a pound of the mixture per hundred pounds of body weight as a day's ration and giving a like amount of hay. Do not feed corn. If he bolts his feed give it from a very large feed box on the bottom of which the feed will spread out thin. If he does not improve in condition give half an ounce of Fowler's solution of arsenic night and morning a week, then give three such doses a day and continue until a quart has been given; then gradually discontinue the medicine taking at least a week to the work. Carrots would be beneficial for this horse. A. S. A.

A Trade in Small Cheese.

IS it practical for a cheese factory to make cheese in one or two-pound sizes? Do any of our American cheese makers put their product in one and two-pound sizes? The subject of manufacturing one and two-pound cheese is soon to be laid before one of the nearby coöperative creameries, the idea being to make small-sized cheese that may be advertised and sold through the parcel post. Can you give any advice? Do you think introduction and sale of foreign-style cheese, the soft kind, in tinfoil and glass jars, will interfere with the sale of small American cheeses? J. E. W.
Watervliet, N. Y.

I do not think anyone has been able to solve the pound cheese question satisfactorily. I spent considerable time myself in an effort to get these small cheeses into dealers' hands, but did not succeed. The main difficulty is, I think, so far as the regular standard Cheddar cheese is concerned, on account of the formation of such a large percentage of the cheese into rind. The present method of paraffining cheese when three to six days old partly at least does away with the trouble. If the consumer is not over fastidious he will not object to eating the rind as a part of the cheese. At the same time, a pound of cheese cut out of a 30 pound flat cheese will be more satisfactory than a pound pressed and cured independently, and another difficulty in the way is the fact that the margin which the grocer gets would probably make him a very sharp competitor as against independent or direct shipment. Furthermore the enormous amount of detail work which would be a necessary part of direct shipment would I am afraid be a very great drawback to the business. It would cost two cents to send the bill and two cents to return the pay, together a pretty good profit on a pound of cheese. So far as manufacturing is concerned it can be done. I should think the best way to press them would be say 10 pounds in flat form, about two inches thick, with a line in the bottom of the hoop and also in the follower directly opposite, indicating a pound in each section. The only objection to this plan would be the open face when the single pounds were cut apart, or on the other hand, each pound could be pressed separate.

The introduction and sale of various forms and types of small cheese both in glass jars and tinfoil satisfies the demand for small packages, and while these packages represent a pretty high cost for the nutrition which they carry, they are, however, very satisfactory to the consumer and are increasing in popularity. Nothing is more attractive than the direct from producer to consumer plan, but it is contrary to our past habits and methods, and will I am sure require a great many trials before it will become common. H. E. COOK.

Portable Pigpens.

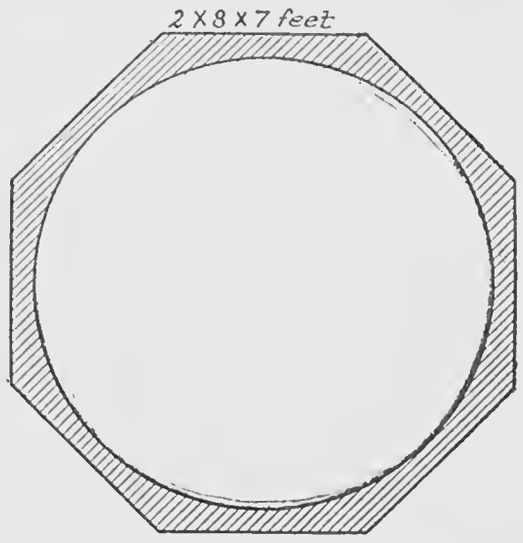
I HAVE five shotes about 75 pounds each, and would like to make a portable pen or yard for them, to be placed in orchard, and moved about once a week. Can such a run be made without placing posts in ground? How high would the wire have to be? How large must the enclosure be? The orchard has very strong, good sod. What other food should be given? L. D. M.

Portable fences are made in a dozen different ways. The theory is to make a set of panels or sections of the fence which can be carried here and there and fixed as desired. These panels are from 10 to 16 feet long, and must be laid strong enough to resist the hogs. The usual plan is to make a frame of some kind of light stuff with two uprights at the end and top and bottom pieces, the full length of the panel nailed to these ends. Generally in addition to these, strips are nailed diagonally across the panel from corner to corner so as to brace it and make it solid, then a strip of woven wire fence can be nailed on the outside of the panel and the thing is complete. They are fastened together in various ways, with strips of wire or hooks put at the corner. As good a form as any is to make the end pieces out of posts about six feet long. The lower end of these posts is sharpened off so that it can be driven down into the ground. Then the panel is made in the ordinary way. In setting this fence the stakes or end pieces are driven firmly into the ground close together, one panel touching the next. This makes a firm fence and the stakes can be pulled out when needed and the fence carried to a new place and driven into the ground again. This makes a firmer fence this way. The panels are hooked or fastened together, and it is probably as good and portable a fence as you could produce.

Octagonal Silo.

I HAVE read of the square silos and am sending a plan of one which I have thought of building. It is eight sided, using 2x8 for the girths and hollow them out in center to make a circle on the inside. I would like to hear from anyone who has built this way. Would No. 1 three-inch flooring, treated with creosote oil, do for the inside lining? Would use a cheap flooring outside.
North Dakota. L. Q. P.

The greatest objection to the silo you depict is that it takes a large amount of needless lumber out of which to make the frame and waste, if it is to be hollowed out on the inside to make it a semblance of being round. Such a silo



PLAN FOR OCTAGON SILO.

was built near me a few years ago. The width of the walls prevented them from drying out properly, and the 2x8 decayed in the center, so that it had to be taken down and a girthed, square silo built in its place. If you were to build the eight-square silo, I would have the girths sized, and as they were being put in place and well spiked, put a liberal amount of gas tar between each layer, and the laps, and make it airtight, avoiding the extra expense of lining up inside with rather costly pitch pine flooring. If you attempt to concave the inside, it will be difficult to get true walls, and will prevent perfect settling of the silage, and make lining up a necessity. I think if you build eight-square, it would be better to have the 2x8 sized to a width, lay them as true as possible to a straight edge. Paint well inside with gas tar and gasoline—I would not smoke while doing it—and you may have a silo to your heart's desire.
JOHN GOULD.

Ropy and Stringy Cream.

WHAT is the cause of stringy cream, or a ropy condition of cream? Our cows are fresh and on good pasture, but the cream does not look right. These cows are two-year-old heifers.
MRS. E. S. T.

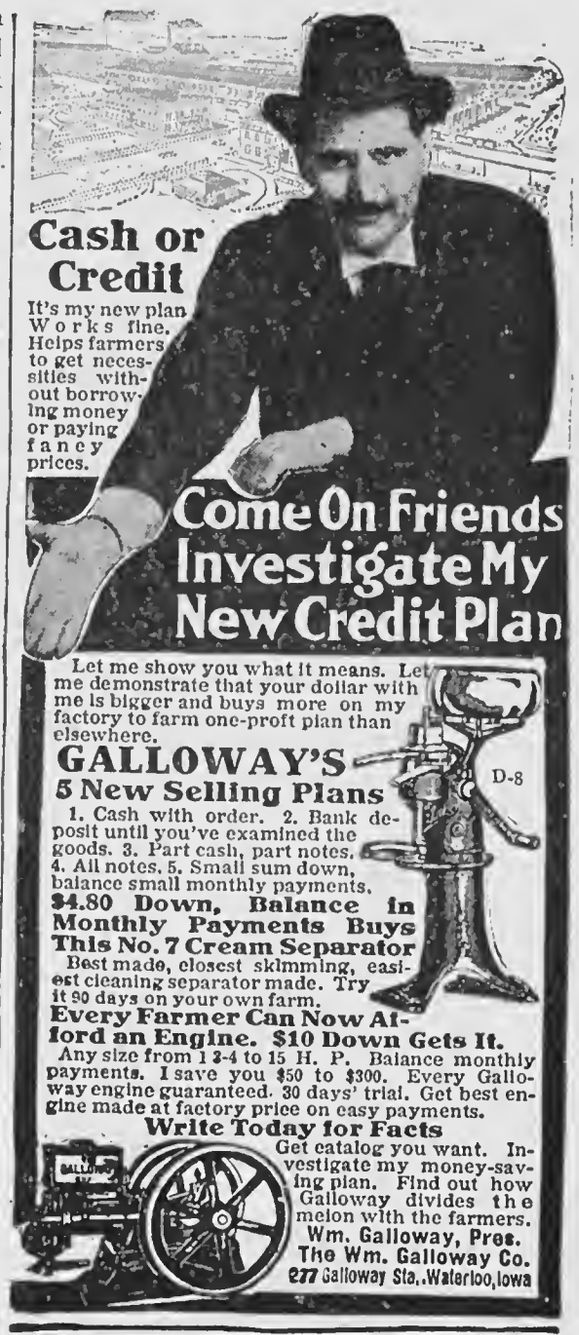
Every year this question comes up regarding milk or cream which turns ropy or stringy a few hours after being brought into the house. It seems to be quite a common complaint, and the scientific men agree that in most cases the trouble is caused by a germ which is found in the stable, on the cow and also upon the utensils which are used in handling the milk. This particular germ is generally found in the pails and pans and very frequently under the rim, where the metal has worked loose and a quantity of sour milk or cream worked in. The remedy is to clean up the stables and thoroughly boil the utensils that are used in handling the milk. We have known cases where farmers were absolutely sure that the pails and pans were kept perfectly clean. It was found that the strainers and dish cloths were merely washed out in warm water and soap and this germ was found in them. In most cases a thorough boiling of everything used in handling the milk and full exposure to the sun after washing will get rid of the germ. In one case, however, this was done with great care, and still the milk was affected. It was found that the pails and pans were rinsed out with water from the pump before they were used, and further investigation proved that an open drain running from the milk-room was so close to the well that the water from it had found its way to the pump. These germs were found in the milk drain and when this was dug up and cleaned the trouble disappeared. A thorough boiling therefore of the utensils will generally clean up the trouble. The Rhode Island Experiment Station at Kingston issued a bulletin on this subject which gave a very thorough discussion of it. In one case reported the cow and her feed were both blamed for the trouble, and farmers would not believe that there could be any other cause. The cow was bought as an experiment, taken away from her old surroundings, thoroughly cleaned up and the milk handled in the most cleanly manner. The trouble disappeared, and did not return, thus proving that the cow or her feed were not responsible for it.

Carbolic Acid as a Disinfectant.

WOULD a weak solution of carbolic acid be a good disinfectant to spray the interior of barn walls any time during the year? Would it have any effect in keeping flies down? Would it scent the milk which is cooled in barn, or affect cattle or horses when windows are out and air circulates freely? If this will not do under these conditions can you give me the name of a disinfectant that will? J. S. G.

A 5% solution of carbolic acid is an efficient disinfectant though it is doubtful if milk could be long exposed to its odor without becoming tainted. Its use on the walls would not keep flies from the stable, nor would it injure cattle. A better disinfectant for stable walls would be a coat of lime whitewash to which had been added four ounces of crude carbolic acid to the gallon. Even without the carbolic acid, the lime wash made with unslaked lime is a mild disinfectant and a very efficient means for sweatening the stable and making it light and sanitary. It should be applied twice yearly.
M. B. D.

"DOCTOR," said he, "I'm a victim of insomnia. I can't sleep if there's the least noise, such as cat on the back fence, for instance." "This powder will be effective," replied the physician, after compounding a prescription. "When do I take it, doctor?" "You give it to the cat in some milk."—Credit Lost.



You need a new
DE LAVAL SEPARATOR NOW

1st If you are still using some gravity or setting process of creaming—

BECAUSE YOUR WASTE IS greatest and quality of product poorest in mid-summer, when the milk supply is greatest.

BECAUSE TIME IS OF greatest value on the farm at this season and the time and labor saving of the good separator counts for most.

BECAUSE THE SKIM-MILK is poorest without a separator in hot weather and often more harmful than helpful to calves.

BECAUSE THE WORK OF an improved De Laval Cream Separator is as perfect and its product as superior with one kind of weather as with another.

2nd If you have a very old De Laval or an inferior separator of any kind—

BECAUSE THE LOSSES OF the poor separator from incomplete skimming and the tainted product of the hard-to-clean and unsanitary separator are greatest at this season.

BECAUSE OF THE GREAT economy of time at this season in having a separator of ample capacity to do the work so much more quickly.

BECAUSE AN IMPROVED De Laval is so much simpler and more easily handled and cared for than any other, and you cannot afford to waste time these busy days "fussing" with a machine that ought to have been thrown on the junk-pile long ago.

BECAUSE THE DE LAVAL Separator of today is just as superior to other separators as the best of other separators to gravity setting, and every feature of De Laval superiority counts for most during the hot summer months.

These are all facts every De Laval local agent is glad of the opportunity to prove to any prospective buyer. If you don't know the nearest De Laval agency simply write the nearest main office, as below.

The De Laval Separator Co., 165 Broadway, New York
29 E. Madison St., Chicago

50,000 BRANCHES AND LOCAL AGENCIES THE WORLD OVER

RAISING AN ORPHAN COLT.

SOME writers have said it is more difficult to raise an orphan colt than a calf. Of course there are differences in colts, as well as in calves. Some calves seem intelligent, and are easily and quickly taught to drink milk; others are "fool calves," stupid, stubborn, and hard to teach. The writer's experience (though not extensive) is that colts are more intelligent, tamer, and are more easily taught to drink cow's milk, than most calves. We had a young mare that foaled unexpectedly in the stable at night, and when found in the morning was suffering and rolling frequently with pain. The rollings were so frequent and violent, that the colt had not sucked, if indeed she had any milk. He had prudently left the stall to get out of danger of being hurt. A neighbor who came into the barn said: "You would better send over the river for old Ben, but I can tell you exactly what he will do. He will send for two quarts of whiskey, give the mare one quart, and drink the other himself." The mare died before night. The post-mortem showed in her stomach a spot as large as a man's hand where the bots had clustered together resembling bees on the outside of the hive before swarming. They were hooked fast to the inner coating of the stomach, which was perforated in places. Some veterinary surgeon may say I must be mistaken, as bots have no teeth. Be it so. I know what I saw, and others who were present, will corroborate me. The colt acted tame and hungry. It was fed some cow's milk, freshly drawn, undiluted, and unmixed with anything. It did not show any alarm at being handled, nor resist having my fingers placed in its mouth, and when the pail was raised to its lips, commenced sucking the milk from between my fingers and continued the operation until its appetite was satisfied. About the third feeding it drank the milk without the fingers, which was as well as any of our calves had done. It was fed whole milk fresh from the cow, for a week or more, and then skim-milk was gradually substituted warmed to a blood heat, and a handful of wheat middling mixed with it to compensate for loss of the cream—as had been our practice in raising calves. It was surprising how quickly the colt learned to eat oats, and nibble hay. Excepting the oats, it was fed and raised exactly as we raised our calves, and apparently was as healthy and grew as fast as if its mother had lived and supplied its natural food. In due time, it became a large, strong, healthy horse, willing to do all kinds of work required.

J. W. INGHAM.

GOATS AND POISON IVY.

HOW can I exterminate poison ivy? Large patches of it are coming in and spreading each year, low growing and also vines. I propose to buy two goats and tie them with chains on a patch, and water them daily. What do you think of this and where would you buy them? Or would brine from butcher do better, or crude oil, and how much to cover about one acre in the aggregate?

Rhode Island. W. B. W.

The following is reprinted from last year's volume of THE R. N.-Y.:

Crude carbolic acid is excellent for killing poison ivy. As it does not corrode metal it can be applied with a pump or sprayer, but the best method is to apply from an oil can to the crown and stem of each individual plant. If it is sprayed it should be diluted with 15 to 30 parts of water and kept well agitated. A strong solution of caustic soda is also effective; it should always be sprayed over the plants in hot dry weather. If you will mow the tops in June and July, and then pour caustic soda over the surface, you will do much to destroy the plants. The soda will render the ground sterile for some time, hence is not advised on arable land. Hot brine is also effective—three pounds of salt to a gallon of water. This kills the plant in about three applications. If the person who works with the ivy rubs pure olive oil over face, neck and hands before exposure to it, the risk of poisoning is much lessened. As the volatile oil that carries the poison usually clings to clothing, and may thus cause further poisoning, it is well to wear overalls that may be discarded or kept for such work only. After the work is done, sponging face, hands or other exposed flesh with grain alcohol is a useful precaution; the toxic oil is not soluble in water alone.

We have had a regular congress of poison ivy experts in THE R. N.-Y., and here are some of their remedies: Fresh leaves and stems of jewel-weed or touch-me-not, bruised and rubbed on (this weed is often found growing near poison ivy); bruised leaves of English plantain or ribgrass; tincture of grindelia; tincture of witch hazel applied hot; hot brine; solution of hyposulphate of soda; creolin, diluted to five per cent. strength, applied on absorbent cotton, and renewed as it dries out; sugar of lead in alcohol, saturated solution. This is poisonous, and must be used carefully. Pure olive oil is also very helpful. A poison ivy cure given by the Florists' Exchange is 90 per cent. of olive oil and 10 per cent. of carbolic acid. It must be mixed by a druggist who has appliances for making a perfect emulsion. Do not allow it to get into the eyes. This is said to give relief with the first application and complete cure with a little further treatment.

In destroying poison ivy, when dried vines are burned make the fire in an open place, and do not get to the windward of it, as the smoke is likely to cause poisoning. Stove wood to which the ivy clings is dangerous, too; its burning often causes inflamed eyes.

The use of goats is a new one to us. Much stock will not eat the plant. We have had reports of cows which cleaned it out along stone walls. On the other hand, there are reports of Ohio lambs which were killed by the ivy—their faces being badly poisoned. Most likely animals differ in their susceptibility to the poison as well as humans.

NEW YORK STATE NEWS.

RABIES BEING CHECKED.—The State Department of Agriculture is fighting rabies in several counties of the State. Westchester County has been quarantined and Rensselaer has several cases. These are being carefully watched to prevent further spread of the disease.

COÖPERATIVE SOCIETIES.—There are at this writing, 31 coöperative societies in this State, organized under the Cole Act. All are incorporated of course. The work of organizing these societies is being kept on a conservative basis because it is discovered that immediately after organization there is likely to be a slackening of effort on the part of members about going after business in a systematic way and it is to assist the new organization at this time that the Bureau finds its services most needed. There are numerous demands for speakers, many from the Granges of the State whose members want information on the subject of cooperation and the proper methods of cooperative organization.

GRANGE GROWTH.—There are now 850 Granges in this State, with an average membership of about 130, estimated. This would make the total membership in the State something over 110,000. There are four Granges that exceed 600 members. These are Webster Grange No. 436, of Monroe County, with a membership of 721; Newark Grange No. 366, of Wayne County, with 652; Fredonia No. 1, of Chautauqua County, with 640, and Jamestown of the same county with 632. There are 23 Granges with a membership exceeding 500.

ALLEGANY FARM BUREAU.—At the recent election of officers and directors of the Allegany Farm Bureau C. F. Moulton, of Cuba, was chosen president; J. R. Hodnett, of Belmont, vice-president; E. W. Barnes, of Wellsville, secretary, and Wm. Breneka, of Angelica, treasurer. F. C. Smith will continue as county agent. On August 4 a picnic and outing for the counties of Allegany, Cattaraugus, Wyoming and Erie will be held at Crystal Lake. The Granges of the county are coöperating in providing funds for the farm bureau, the Pomona Grange giving $50, and several of the subordinate Granges $10 or more each. There are at present about 180 members of the farm bureau association.

CORN AND POTATO CONTEST.—The Pomona Grange, the county Farm Bureau and the county school superintendents of Jefferson County are coöperating in a corn and potato-growing contest for boys and girls. There have been registered in this contest 40 boys each to grow one acre of corn; 35 boys who will grow and exhibit 10 ears of corn; 98 boys and girls each growing a quarter acre of potatoes; 30 boys and girls who will grow and exhibit a plate of 10 potatoes. The round-up will be held in December during the meeting of the Pomona Grange. The subordinate Granges of the county are raising the funds to pay the awards, each Grange contributing from $3 to $5. There will also be a corn growing contest "open to all comers" and all contestants must grow one acre of corn and exhibit 10 ears of the same at the annual Northern New York corn show to be held during Farmers' Week at the State school of agriculture at Camden. The Pomona Grange will hold its annual Field Day at City Park sometime in August and at the county fair in the Fall will have a booth containing exhibits.

FARM BROKERS MEET.—The farm brokers of the State had an interesting session in Ithaca last week. Col. C. A. Simmons, secretary of the Industrial Commission of Ithaca, told the brokers that the popular mind failed to appreciate the resources of this State when comparing its products with those of the prairies of the West. The State of New York, he said, produces four times as much wheat per acre as North Dakota, 7.6 bushels more than Nebraska and nearly 10 more than Missouri. The increased price to the New York farmer leaves him a net profit on a 10-acre wheat field of more than $110 above that of South Dakota. Marc W. Cole told the brokers that more pictures of actual farm scenes in the East should be published and distributed and that proofs of the reliability of the farm brokers such as were represented in the association should be placed before possible buyers of farms. The advertising committee adopted plans for giving eastern possibilities in farming greater publicity. Prof. Mann said that the College of Agriculture did a business last year of $125,000 in butter, ice cream and cheese and that an average of something like 30,000 pounds of milk are handled daily at the College.

GOV. GLYNN WIELDS AXE.—When the appropriation bills left the Governor's hands the other day the amounts were reduced by the sum of $1,508,000. This brings his total vetoes for the year up to $7,272,000 which is the record for the office. Accompanying the vetoes was a memorandum giving his reasons for the veto of each item. Some of them are interesting. Here are a few of particular interest to farmer readers: State Fair Commission for deficiency in appropriation for maintenance, care of grounds and buildings, etc., $15,000. "Revenue from the State Fair will provide." Conservation department $6,000 for printing syllabus of fish and game law. "No changes in law warranting it." Same department $10,000 for maintenance of fish hatcheries, traveling expenses of fish culturists, etc. "Funds available ought to be sufficient for this year." State architect for traveling expenses of officers and employees $10,000 and for furniture, blanks, etc., $6,000. "Unnecessary." State Agricultural Experiment Station $30,000 for improvements, etc. "Appropriation one of convenience and not necessity." Cornell Agricultural college several items including one of $40,000 for forestry land and timber to be used in instruction. "State not in position to expend so much for an entirely new enterprise." Syracuse College of Forestry $40,000 for equipment for new building. "Building will not be finished for a long time." State Training School at Hudson $3,500. "Appropriation for purposes which are mere guess work." The total appropriations for the year amount to $47,570,000 against $57,960,000 for 1913.

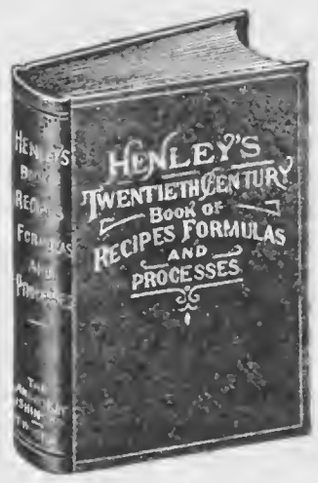
HENLEY'S 20th CENTURY BOOK
OF
RECIPES, FORMULAS AND PROCESSES.

Contains Over 10,000 Selected Scientific, Chemical, Technological and Practical Recipes and Processes, Including Hundreds of So-called Trade Secrets for Every Business.

Edited by GARDNER D. HISCOX, M.E.



This is the book everyone should have at his command who seeks practical, accurate knowledge and guidance in his every-day work, as no book has ever been published which so fully meets the multifarious requirements of the factory, the workshop, the laboratory, and the household.

The entire work is a veritable mine of practical information and up-to-date in every respect. A work which will prove of value to the Artisan, Mechanic, Engineer and all engaged in any way in any of the fine arts. From the contents we append only a few of the subjects treated, lack of space preventing the publishers from giving more:

Adhesives, alcohol, alloys, aluminum and its treatment, amalgams, ammonia, antiseptics, belt pastes, benzine, beverages, boiler compounds, brass, bronzes, castings, celluloid, cements, ceramics, cigars, cleaning preparations and methods, condiments, confectionery, copper, cosmetics, disinfectants, dyeing, electroplating, electrotyping, enameling, engraving, essence and extracts, etching, explosives, fertilizers, fireproofing, food adulterations, freezing preventives, fumigants, glass, gold, hectograph pads and ink, household formulas, ink, iron, ivory, jewelers' formulas, lacquers, laundry preparation, leather, lubricants, metals, mirrors, molds, nickel testing, oils, paints, paper, perfumery, petroleum, photography, plaster, plating, polishers, porcelain, pyrotechnies, ropes, rubber, screws, silver, soaps, solders, spirits, stamping, steel, stone, varnishes, waterproofing, weights and measures, wire rope, zinc.

THE BEST BOOK FOR THE PRACTICAL MAN EVER PUBLISHED.

800 pages. Size, 6x9½. Well printed on fine strong book paper. Beautifully bound in red cloth; neatly lettered in gold; a valuable and attractive volume.

Will be sent for Three (3) New Yearly Subscriptions or Six (6) Renewal Subscriptions; or we will mail THE RURAL NEW-YORKER one year, new or renewal, and deliver a copy of the book, prepaid, for $2.50.

The Rural New-Yorker, 333 W. 30th St., N. Y.

Ellis Champion Threshers

Suit everyone. Both the professional thresherman or the farmer who wants a home outfit will find the Champion rightly named. The picture shows ELLIS CHAMPION No. 2. It is complete with stacker, tailings, elevator and grain bagger. Connect it with steam, gasoline, tread or any other power, put in the grain and the Champion does the rest. No straw clogging. Any size.

We also make tread and sweep horse-power, drag or circular saws, ensilage cutters, corn shellers, etc. Our catalog tells the whole story.

Be Your Own Thresherman

Save enough to own the Thresher. Be independent. Do the work when you get ready.

ELLIS KEYSTONE AGRICULTURAL WORKS, Pottstown, Pa.

A Price Easy To Pay

Ideal for Hilly Country—Simple—Few Parts—Medium Power

LIGHT-STRONG-BIG CAPACITY

It will soon pay for itself, Mr. Thresherman. It will serve you faithfully. Don't invest in one of the bridge-breakers, the kind that cost so much to haul and operate. Figure on a Gray and compare the big saving in first cost. You'll get the same capacity and durability in a lighter machine if you buy one of our

Gray Line

THRESHERS

73 years of experience stand back of them. We are known from coast to coast. Gray Threshers are famous for durability, simplicity, accessibility, few parts, uniform threshing, low repair cost, easy transportation, great strength, and low first cost. We make many sizes for the farmer's private use or for contracting Threshermen. Send postal now for our Catalog. It's free.

Trapping Troublesome Pigeons.

I NOTICED an inquiry from someone troubled by stray pigeons that come to his place and annoy him in several ways, but it has been about impossible to get rid of them by any known means. Poisoning has been suggested, and while this might be effective in some degree it would be very dangerous, for the poisoned food would be carried by sparrows or in some other way get where poultry or other useful birds or animals would get it and be killed. There need be but little trouble to catch the pigeons by trapping them in two ways, as I know by experience, for my son once kept pigeons and was troubled with strays eating the feed he had for his own. The strays will very readily go into any place where feed is put that they can enter and nest boxes are especially attractive to them. If the person being bothered will fix almost any kind of box or boxes and place them bottom upwards where they will look homelike to the pigeons, he can catch them easily. They may be fed in these inverted boxes or houses and even allowed to begin to build nests if they stay open long enough. The trapping is the easiest sort of thing. Make a swinging wire door, hinged at the top, to put just inside each opening by bending it like the letter "u" only with square instead of rounded corners. The length of the bent wire should be a little more than the height of the opening to be shut. Two small staples are driven over the wire door near the corners, which serve as hinges as well as to hold it in an inverted position. To the pigeons it looks *very open*, as it really is so far as *going in* is concerned, but in trying to *come out* the ends of the wire touched the floor of the box, and being near enough together to prevent the birds from passing between them, the trap is complete. It is then an easy matter to get the pigeons out and kill them. They are good to eat and put to this use they will pay well for the trouble of catching them.

Another kind of trap may be made by setting a big sieve or any sort of wire or slat covered box, inverted, and a stick with a string tied to it under one edge as a trigger. This should be set and baited with wheat or anything that pigeons like and allow them to come under the trap and eat and go out until they get familiar with it. Then bait well and hold the farther end of the string at some hidden place from which it can be pulled and the birds caught. The boys can have considerable fun and then all enjoy pigeon pot-pie.

H. E. VAN DEMAN.

Trouble With Chicks.

What is the matter with my young chicks? I had 125 chicks hatch out from the incubator; when they hatched they were very thrifty, but the chicks have been dying ever since. They seem to feel good till a couple of hours before they die, their eyes seem to swell and go shut so they cannot see. The throat seems to fill up and they cannot get their breath. Some of our laying hens' throats seem to fill up, but they seem to choke it down, only one laying hen has died. I would like to know how to care for young chicks and feed them after they come from the incubator.

Michigan. R. L. M.

Young chicks are subject to catarrhal inflammation of the eyes, due to exposure to cold, dampness, irritation from strong fumes, etc., and it may be that one of these conditions or a roupy infection from exposure to older fowls with a similar disease is responsible for the trouble in your flock; without knowing just the conditions under which they are kept it is impossible to say positively. As a matter of precaution against contagion young chicks should be kept away from older fowls and the quarters in which they are kept should be thoroughly cleaned and disinfected if they have previously been occupied by other fowls. Previously used drinking fountains, feed dishes, etc., should always be thoroughly scalded with *boiling* water before being placed before young chicks.

Do not feed chicks anything for from 24 to 36 hours after hatching; they need this time in which to absorb the undigested yolk still remaining within their bodies. For the first feed give stale bread crumbs which may be dipped into milk and squeezed dry, oat flakes, crumbled johnny cake made from cornmeal, a little fine chick grit and fresh water. This diet will do for a couple of days, during which time they should be fed five times daily, giving them only as much as they will quickly clean up. Then put them on the regular chick grain composed of pinhead oat meal, one part; finely cracked corn, two parts; and cracked wheat, three parts; the "One, two, three" mixture, or use one of the commercial chick foods, if preferred. Feed this twice daily and in addition keep before them, in a shallow box, a dry mash composed of equal parts by weight of cornmeal, wheat middlings, wheat bran, and sifted beef scrap. This mash may also be fed moistened with skim-milk two or three times daily in addition to the chick grain; some flocks of young chicks eat so much of the mash dry that little need be fed in a moist condition, others need more moistened food. Dry food is the safest and care should be taken not to overfeed upon wet mashes. As chicks increase in age the number of daily meals may be decreased and if they are upon range the dry mash and grain mixtures, consisting chiefly, or wholly, of cracked corn and wheat, may be kept always before them in hoppers. See that chicks at all ages have grit of suitable size and water always before them; crushed charcoal and oyster shell should also be available.

M. B. D.

Deficient Vigor.

I bought 15 day-old chicks hatched in an incubator three weeks ago, and put them with a hen. They did very nicely until a week ago. I noticed that one or two slept a great deal. I took one in and washed its eyes. I found some small dark brown spots on the eyelid, they were hard and all washed off and have not come back on that chicken, but the chicken sleeps just the same. More have the spots on the eyelids and their bills are dark next their combs. They eat well and do not look sickly. They have bread crumbs, sour milk, baby chick food as dry mash, fine ground grains.

Massachusetts. E. E. S.

Your description does not indicate any serious trouble with the eyes, but rather a lack of vigor which may have one of several causes and which makes the chicks sleepy and stupid. Lice or mites from the hen or from the nesting materials may be sapping the strength of the chicks. Examine the hen and chicks carefully and if any lice are found dust the hen thoroughly with a good lice powder and grease the chicks under the wings and on the head with a little lard or vaseline; repeat after a few days. See that the hen does not brood her chicks in dirty quarters where mites may abound. It is safe to assume that all hens are lousy; unless they have been specially and carefully treated, they are; and then they probably are. Some chicks are born with so little vitality that they succumb to bowel troubles of some nature after they reach the age of one to two weeks or a little more. Others may die at any age without showing evidences of serious bowel troubles though digestive disturbances may be present. The trouble here is apt to lie with the breeding stock and it is too late to remedy it after the chicks are hatched. Deficient vigor from artificial hatching is also probably responsible for many of the deaths of young chicks in which no definite disease can be found. There must, of course, be some definite cause for a death but behind this cause may be a weak organism unable to cope successfully with the ordinary ills of chickhood. M. B. D.

Hen Lice.

1. What can I use on hen lice? They are a light red, quite large. I also have trouble with a large louse on the chickens' heads; have used sulphur, lard and coal oil on them. 2. A large Plymouth Rock hen has a sore on lower part of body. What can I do for it? W. C. H.

Angola, N. Y.

The red lice that you see are probably red mites which are red only when gorged with their victims' blood. They seldom stay upon the fowls during the day but may be found in the cracks about the perches, nests and other places where the hens resort. To destroy them paint or spray all these places with kerosene or crude oil to which has been added one fourth part of crude carbolic acid. Search out all their hiding places behind nests, under perches, etc.; if you have never looked for them, a little close investigation will probably surprise you. Head lice may be killed by any grease but the addition of one-fourth part of blue ointment will add to the effectiveness of the ointment. 2. Treat the sore of which you speak with carbolized vaseline in 5% strength.

"The Business Hen," published by the Rural Publishing Co., has a chapter on the diseases of poultry, and is a good treatise on their general care. Farmers' Bulletin No. 530 from the U. S. Department of Agriculture, Washington, D. C., also treats of the common diseases of poultry and may be had upon application without charge. M. B. D.

Possible Limberneck,

I have a hen which had been sitting about 10 days when she developed something like limberneck. She has her head under her breast continuously, and does not care to eat anything. Give possible cause and remedy. J. D. H.

Kingston, N. Y.

I hardly think that this is a case of limberneck though I cannot say what it is. If the hen appears sick, give her a good big teaspoonful of castor oil, being sure to get more of it on the inside of her neck than on the outside, and if she has no fatal disease, she will probably respond to the treatment. M. B. D.

Tramp Hens.

I notice that you publish only one side of the damage by hens story. I believe that the damage, bad as it is, is caused by comparatively a few hens, and that if those who are troubled with the neighbors' hens would build trap coops to catch the hens that did the damage, the owners would be glad to sell them. When you ask a man to shut up 200 hens because a half dozen are getting over the line fence, well, he doesn't do it.

Skaneateles, N. Y. W. P.

R. N.-Y.—But why should he not be compelled to do so? Why must the man who suffers the loss be compelled to trap out the culprits in the flock? If a man keeps 100 hens and six of them do the damage, he should either select out the six himself or keep the 100 shut up.

Infertile Turkey Eggs.

Last Spring I bought two White Holland hen turkeys and a tom, claimed not to be related. They were hatched the first of last August. They were nice well-grown turkeys for their age. They mated well and began laying about the first of April. I took good care of the eggs, kept them in a box of wheat bran and turned them every day until I had 28 and then I set them. Not one of the eggs proved to be fertile. I would like to know the reason. Is the fault in me, or the turkeys, or the one who sold me the turkeys? F. C. K.

New York.

I cannot be positive as to the cause of the infertility of these eggs, but am inclined to lay it to the immaturity of all the turkeys concerned; it is possible, of course, that the male bird alone is at fault and should be discarded. Turkeys used in the breeding pen should all be at least one year old and well developed, vigorous, specimens; the hazards of turkey raising are too great, at best, to justify the use of immature parent stock. If another, and older, tom cannot be procured, it may be possible to take the hens to a neighbor's flock and allow them to run with it for a few days. One mating of turkeys is sufficient as a rule for the season. M. B. D.

More About Line Breeding.

On page 241 there is a chart of line-breeding from Felch. I am breeding for the male characteristics. I bred A plus B equals C, then C plus A equals D, then D plus A equals E. Am I right? Then if I get new blood from the same breeder that I got the first males from, shall I be line-breeding? For illustrate, I got a cock which equals A; then if I send to same breeder and get eggs and raise males and breed them to E, will that be line-breeding, and is that the proper place at which to introduce fresh blood? Should I introduce fresh blood next at G?

Groton, N. Y. N. E. K.

You are right, and when you get "E," which you may call a combination of daughter and great granddaughter, you have a fowl, or several fowls, containing seven-eighths of the blood of "A," whose blood you wished to perpetuate and intensify in his descendents. You may continue to line-breed according to the chart until you get "G" with 27-32 of the blood of "A," in other words, you have almost reproduced the original male "A," so far as blood goes. If, however, you mate "G" with some more or less distant relatives from the same breeder, you stop line-breeding from "A" and commence simply to inbreed or breed together closely related animals. In doing this you maintain the strain pure, but begin to dilute the blood of "A" in his descendents. This is proper if you wish to do it, as it is to be assumed that your original cock "A" was of such superiority that you wished to perpetuate his blood for breeding purposes. This form of line-breeding is close inbreeding and will perpetuate and intensify "A's" defects as well as his good qualities, and unless you select and cull "A's" progeny rigidly, you may find that "G" is an inferior specimen that should find no place in a breeding pen. There is no particular place at which fresh blood should be introduced; you may cross any of "A's" progeny with other fowls of the same strain, but the further you line-breed from "A," the more of his blood you will have in your new mating. I have used the terms line-breeding and inbreeding here as they are used in the chart, but it is only proper to say that you will find this meaning of these terms reversed by some writers upon animal breeding.

M. B. D.

Depluming Mites.

Can you give me a practical remedy for depluming mite on hens and also how to apply it? H. G. L.

Massachusetts.

A little grease of any kind well rubbed into the skin of the affected parts will kill these mites and permit new feathers to grow. The addition of one-fourth its bulk of blue, or mercurial, ointment will add to the effectiveness of the lard or other grease used. M. B. D.

When you write advertisers mention The R. N.-Y. and you'll get a quick reply and a "square deal." See guarantee editorial page. : : : :

MACKENSEN, Naturalist, Department 10, Yardley, Pa.

The Henyard.

THE EGG-LAYING CONTEST.

THE report for the month of May gives some interesting figures. The pen of English White Leghorns leads, with a score of 258 eggs, beating the English Wyandottes, about which so much has been said lately, by 50 eggs. The second best pen was the Buff Leghorns from Wolverine Poultry Farm, Michigan. They laid 252, one pullet laying 29 eggs in the 31 days. Mrs. K. E. Woodruff's pen of White Leghorns tied for third place with Marwood Poultry Farm, with scores of 242 each. P. G. Platt's pen laid 240, and three pens of White Leghorns laid 237 each They are Glenview Poultry Farm's pen, Francis F. Lincoln's pen, and Geo. A. Cosgrove's pen, all from Connecticut.

H. W. Collingwood's pen of "scrubs" laid 221, beating all the Rhode Island Reds, all the White Wyandottes, all the Buff Wyandottes, all the Barred Rocks but one pen, all the White Rocks but one pen, and all the Buff P. Rocks. In fact, there were only 13 pens in the contest that laid more eggs, in addition to the winning pens named above. There was some good individual records made, notably two pullets in A. B. Brundage's S. C. Reds. One laid 29 and one 28 eggs during the month. Two White Leghorn pullets from Glenview Poultry Farm laid 28 eggs each, and one of Mr. Collingwood's scrubs laid 28. The total number laid during the month was 15,895.

In the thirty-second week, ending June 12, 3,289 eggs were laid; this is 151 less than the previous week. White Leghorns again make all the high scores. Three pens tie for first place with scores of 57 each. They are Chas. N. St. John's pen, the English pen, and Geo. A. Cosgrove's pen. P. G. Platt's pen ties with Marwood Poultry Farm for second place, with scores of 55 each. A. B. Brundage's pen of S. C. Reds laid 54. They are the only pen outside of White Leghorns to get into the high scores this week. Four pens of White Leghorns laid 53 each. Below is the record:

	Week	Total
Barred Rocks.		
A. B. Hall, Connecticut	35	788

GEO. A. COSGROVE.

Hen Lice.

I have for years used a remedy for destroying hen lice which has for many years proved efficient in my henhouse. I cut up gunny sacking into pieces to fit the bottom of my hens' nests; these pieces I saturate with coal oil, place them in the bottom of the nests and then complete the nests with clean straw. This operation I repeat several times during the Summer, and my chickens are not bothered with lice of any kind. I have tried several kinds of "lice killers"; this is the only one I have ever found reliable.

Ohio. GEO. W. RICE.

Interfering With Pigeons.

Is there any law in the State of New York protecting banded or registered pigeons while flying at large? If so what is the penalty for theft or shooting?

New York. J. B. C.

The law provides that no person shall take or interfere with any Antwerp or homing pigeon, if it have the name of its owner stamped upon its wing or tail, or wear a ring or seamless leg band with its registered number stamped thereon, or have any other distinguishing mark; nor shall any person remove any such distinguishing mark from any such pigeon, and the penalty for a violation of this act makes the party guilty of a misdemeanor.

Leghorns Untrue to Type.

Some years ago I had a purebred flock of White Leghorns and allowed one Plymouth Rock hen to run with them, but did not set any of her eggs. When the chickens came to maturity many of them were colored like the Plymouth Rock and I had to start again with new blood. Was this just a freak, or is it likely to occur again under the same conditions.

Vermont. E. H. B.

The presence of a hen of another breed in a flock of purebred fowls would not in any way affect the chicks of the latter. If the chicks from your White Leghorns showed the markings of a Plymouth Rock it was conclusive evidence either of an accidental cross or of the fact that the White Leghorns were not purebred. Some Plymouth Rock eggs are very light-colored and it may have been possible that you unintentionally mixed a few of the Plymouth Rock's eggs with those of the Leghorns. In any event, the explanation will have to be other than the presence of a Plymouth Rock hen in a flock of purebred Leghorns. M. B. D.

Hens Lay Stale Eggs.

What makes hens or pullets lay ill-smelling eggs? I have three that do this. I feed corn, oats, wheat, also scratch feed. Fowls have grit, shell and charcoal before them at all times. They are yarded so they do not get any stale stuff, only the table scraps off my own table. I also cut grass for them. The hens that lay these bad-smelling eggs are looking in the best of health. One of them has never been sick to my knowledge, the other two had a touch of the roup last Winter, but I cured them of it quick. I have talked with a number of poultrymen about these eggs but they all say they never heard of such a thing.

New York. H. B.

It is quite within the bounds of possibility for eggs to be retained in the oviduct of a laying hen until the heat of her body causes beginning putrefactive changes, in fact, one instance has been reported of a well-developed embryo being taken from an egg that was removed from a hen's body during an autopsy upon the fowl. It is evident, therefore, that a newly-laid egg is not necessarily a fresh egg, though fortunately they usually are. The condition that you speak of is certainly rare, but it is not unknown, and it is quite possible that these hens habitually retain their fully developed eggs long enough for decomposition to begin. If you can identify the hens responsible for these stale eggs will you not separate them from the rest and carefully note the frequency with which they lay and any conditions which seem to you unusual in their performance?

M. B. D.

Value of Poultry Manure.

Would you quote 10 experiment stations from the Eastern and New England States, giving their different values of poultry droppings from a Leghorn hen per year, which has been well fed, six months on range and six months confined in buildings? Also the value per bushel. The University of Wisconsin and New York quote poultry droppings very low per bushel compared with the New York Experiment Station, which values the poultry droppings at about 32 cents per hen. I would like to have some one who knows give its real value compared with other fertilizers. L. J. H.

Smithville Flats, N. Y.

No 10 experiment stations in the East have published the value of poultry droppings from one hen in a year. The New York State Poultry Department gives the value of the droppings produced in one year by Lady Cornell at 29 cents. Prof. H. R. Lewis of the New Jersey State Poultry Department in his book entitled "Productive Poultry Husbandry," gives the value of the droppings produced by the Belle of Jersey as 33 cents. Both of these hens were extra heavy producers, and hence of course, heavy consumers. If we put a value on poultry manure at $4 per ton, it is likely that the average White Leghorn hen will produce in one year from 15 to 20 cents worth. Poultry manure, as compared with other fertilizer and based on its actual food content, will show a valuation of about $3 or $3.50 per ton. The plant food content in poultry manure is largely nitrogen in a quickly available form. It is best used on grass or corn lands and should be spread broadcast and harrowed in. Much of its value depends upon how it has been kept since produced. By mixing some suitable absorbent with it when storing in a dry place, it will keep a long while without giving off any obnoxious odors. Dry earth is as good to mix with it as anything I know of. A. L. C.

Suspected Lumpy Jaw.

I have a good Jersey cow which will have her second calf early in July. Is good in butterfat, yielding about 350 pounds last year. Without any apparent cause she got a swelling on under side of jaw bones. She has been on pasture. It looks like big jaw (actinomycosis). The only symptom is that she slobbers somewhat which she never did before. We noticed the swelling on May 1 and at once began using the iodide of potassium and will also blister same. If the swelling does not get better, would you advise the services of a veterinarian? Do you think using the knife would be advisable? If the swelling does not get better would it be advisable to keep cow and run risk of getting worse or would it be best to fatten and butcher? Does this disease affect the milk? How can I tell whether she is getting worse or better? E. K.

Pennsylvania.

The first step in such a case should be to apply the tuberculin test. If she is not tubercular her milk may safely be used and she will be as healthy as ever if she recovers. Iodide of potash causes slobbering. So does actinomycosis of the tongue (wooden tongue). When the bones are badly involved treatment seldom proves profitable and the animal should go to the butcher. Recovery may take place where the tongue or other soft tissues are involved and the knife should be used, either to remove a tumor or split into it from the insertion of caustics. The operation or use of caustic and iodide of potash should be postponed until after calving. The drug is liable to cause abortion or kill the calf, or make the calf so weak that it cannot live.

BARRED ROCKS
Eggs—$1 per 15; $3.50 per 100. Baby chicks.
B. H. HENION, - Brockport, New York

"Perfection" Barred Rocks—Every pen headed by prize-winners (Ringlet strain). Eggs, $2 per 15; 3 settings for $5. Utility eggs (free range) $1 per 15. **Dr. HAYMAN, Box R 48, Doylestown, Pa.**

CHOICE, Large, Prolific THREE-BAND ITALIAN QUEENS—untested, $1; tested, $1.50. Ready to mail. **W. K. ROCKWELL, Bloomfield, Connecticut**

Parcel Post Egg Boxes—NEW FLATS AND FILLERS
H. K. BRUNNER, 45 Harrison St., New York

HAMPTON'S S. C. BLACK LEGHORN BABY **CHICKS**
FOR JULY AND AUGUST DELIVERY
100—$8.00 50—$4.50 25—$2.50
The Black Leghorn has been proved best by every test—greatest layers, hardiest, healthiest; chicks are easily raised, free from diarrhoea. A great chance to get good stock at a low price. Every chick guaranteed hatched from my own breeding stock. Hundreds of satisfied customers everywhere. Cannot ship C.O.D., but will guarantee safe delivery. Order at once. Circulars free.
A. E. HAMPTON, Box 205, Pittstown, N. J.
Member S. C. Black Leghorn Club of America

CLOSING OUT the following stock on account of keeping White Leghorns exclusively **Rhode Island Reds, Black Minorcas, White Orpingtons, Lgt. Brahmas, White Plymouth Rocks, White Pekin Ducks, a few Yearling White Leghorns & White Leghorn Cockerels** First-Class Stock for sale cheap for want of room **SUSSEX FARMS, Middleville, Sussex Co., N. J.**

S. C. BROWN & WHITE LEGHORNS, Dk. & Lt. BRAHMAS, R. I. REDS, W. Wyandottes & Barred Rocks. Show & Utility quality. Won 76 ribbons this season, including New York & Philadelphia. EGGS, Baby CHICKS, Breeders. Illustrated catalog free. **Riverdale Poultry Farm, Riverdale, N. J**

BABY CHIX—S. C. White Leghorns $10.00 per 100. **Rocky Glen Poultry Farm, Poughkeepsie N Y**

AUSTIN'S 200-EGG STRAIN SINGLE COMB Rhode Island Reds standard bred, high record stock, red to the skin. Old and young stock for sale. **AUSTIN'S POULTRY FARM, Box 17, Centre Harbor, N. H.**

R. I. Reds, Indian Runner Ducks
Eggs for hatching. Breeding stock.
Sinclair Smith, 602 5th St., Brooklyn, N. Y.

Indian Runner Duck Eggs
Fawn and white. Valentine's strain. Bred from prize-winning birds. White egg strain. Eggs, $1 per 13.
ROBERT K. TWEDDLE, Montgomery, N.Y.

DUCKLINGS, GUINEA CHICKS, LEGHORNS, etc.; hatching eggs all kinds; free circular. Tel. 98-2. **F. S. KEITH, EASTON, MASS.**

Indian Runner Duck Eggs—$1.25 per 12; $6 per 100, express paid. **CRANDALL FARMS, Albion, New York**

FOR SALE—60 1-year old Indian Runner Ducks. Fawn and white. Harshbarger white egg strain, guaranteed. No Draks. **JOHN SCHMITT, Harold Farm, Montgomery, N.Y.**

PIGEONS FOR SALE—White Kings, French Carneaux and Maltese Hens. White, Black and Blue. Particulars address **JOHN EMMELUTH, EAST LANOIS AVENUE, VINELAND, N. J.**

Superior Strains Poultry, Eggs, Fancy Pigeons; large squabbers specialty; Homers wanted. **POULTRY-PIGEON FARM, Marietta, Pa.**

TRAINING A COLLIE DOG.

Cultivating His Brain.

FIRST PRINCIPLES.—On page 743, I notice an inquiry from J. M. L., Alwent, Pa., regarding the training of a collie dog. As I am a breeder of collies and have been very sueeessful in training them my experienee may be of some value. First of all, it must be remembered that a collie is both intelligent and sensitive, and that harsh measures will surely spoil him. Personally, I never use a whip exeept in ease of a grave offense, such as hen-killing and even then a few sharp strokes and a good seolding will generally be found sufficient. The best age to begin training is at three or four months. After a year the task will be much harder. The first thing any dog must learn is to obey the call or whistle, and in this great patienee is neeessary. I have found it a good plan to have ready a small piece of bread, eake, or biseuit, which I give to the pupil as soon as he eomes to me. It does not matter how slow he has been—he will be quieker next time, and before long he will have formed the habit of answering the eall and then the reward may be omitted. He must also be taught to lie down. This is done by pushing him firmly to the ground and repeating the eommand "lie down" or "eharge." Make the lesson short, and give a bit of bread each time that you push him down—do not wait till he does it of his own aeeord. In this way he will really enjoy the lesson and will be on the alert. This method should be used in teaching the tricks that every dog owner likes his pet to perform and also the more useful work about the farm.

FURTHER ACCOMPLISHMENTS.—The hardest thing to teach a collie is to retrieve. To do this take a bone, tease the dog with it and then throw it a short distance. The dog will run after it and pick it up. Do not eall him, as he will probably drop the bone and come to you. Instead, go quietly to him, take the bone away and throw it again. It may be weeks before he learns to bring it to you and then a ball may be substituted for the bone. Next, hold him while you throw the ball, and when he has learned to fetch it without ehasing it just place it in full view and send him after it. Then substitute a newspaper, a strap, a handkerchief, ete., using the name of the article over and over again when telling the dog to get it. I have a dog trained in this way who will not only carry a bundle or umbrella, but will piek up, without being told, anything I may drop or that may fall out of the earriage when I am driving. He will also earry messages or small articles to different members of the family, so that this accomplishment while diffieult to teach is well worth the time spent on it.

TRAINING FOR FARM WORK.—The training for a sheep or eattle dog is more complieated, but the main points are prompt obedience to the eommands "lie down," "stay there," "eome," ete., and quietness about his work. Make him stay close at your heels at first, and do not let him take any aetive part in the driving until his charges are quite used to his presenee. Puppies should always be kept in large yards unless they ean be watehed, or they will form bad habits. They will often chase a hen or chieken in play, and if they suceeed in eatehing and killing even one it is hard to break them of it. A good plan is to take the pup into the henhouse whenever you feed the hens. Make him keep elose to you and check at once any tendency to give chase. An older dog will probably give no trouble, and should be allowed his liberty in the day time, shutting him in a yard at night. He should never be chained. A collie needs lots of exercise, and if confined constantly he will run off on every opportunity.

THE "ONE-MAN" DOG.—It is rather hard to teach a dog not to take food from strangers, espeeially if he is over a year old. He should be fed a light meal in the morning and a full meal at night so that he will never be too hungry to resist temptation. He should be made, as far as possible, a "one-man" dog, and to do this it is necessary that the same person feed, train, and exercise him. He should never be allowed to toueh food offered him by another, even a friend, and he should be kept at home as mueh as possible. If I have made this rather long and detailed it is because I have seen many a good dog spoiled for lack of proper training, and when anyone asks for advice I like to give all the help I ean.

New Hampshire. GENEVIEVE TORREY.

AILING ANIMALS.

Horse Eats Bedding.

We have a horse that will eat his bedding, unless it is of leaves or shavings, and as he had a bad attaek of colie from overeating I am foreed to use shavings, which of eourse injures the manure. What ean one do to bring deeay, and eorreet aeidity of soil resulting from its use? H. H. P.

Massaehusetts.

Muzzle the horse if he has to stand on bedding when not working, or keep him in a box stall unbedded, when he is not at work; then put him into a bedded stall at night. The shavings do not materially injure the manure and no treatment is neeessary to prevent aeidity. A. S. A.

Scours.

On May 25 our old hog had 14 little ones. All eould not eat, so we brought two of the smallest to the house, and are feeding them on a bottle. We take them to the barn twiee a day, but think they do not get any milk. We are feeding one tablespoon eow's milk (unsealded) and one tablespoon rain water to eaeh every hour, exeept from nine at night till five in the morning. We have tried raising them by hand before but they always have diarrhœa and die. These are not affected that way yet. Can you tell us how to prepare cow's milk, and how often to feed, and anything else that we need to know? M. A. J.

New York.

Dilute the milk with hot water and add one ounee of limewater to the pint. Feed from a sterilized nursing bottle and nipple at first, allowing a little milk at least onee an hour. Gradually lengthen the times between meals and increase the amount of milk. As soon as possible let the pigs learn to drink from a elean trough and then gradually add middlings, oatmeal and eornmeal to the milk. Sweet skim-milk may be gradually substituted after the first three or four weeks of feeding. Add a little flaxseed meal if there is a tendeney to eonstipation. Cut the ration down a half if scours starts and give eaeh affeeted pig five grains of subnitrate of bismuth every four hours until seouring subsides. In bad cases give a dose of eastor oil in milk, before giving the first dose of bismuth. A. S. A.

Rickets.

Can you tell me what is the matter with my little pigs? I have seven and they are in their fifth week. There seems to be something wrong with their legs when they get up after resting; they seem to have a weakness in the joints of their knees. They have a niee eomfortable house raised a foot from the ground with a good board floor with sawdust and sand, and hay on top for their bed. They also have a good dry run to root in. They seem to be very lively and eat well.

Massaehusetts. J. B.

Allow the pigs free range on grass, clover or rape and feed mixed rations in form of slop, adding limewater at the rate of one ounee to the quart. The pigs have riekets from malnutrition. Do not make corn more than a very small part of the ration. As they improve add digester tankage to the slop to make 10 per eent. of the mixture. A. S. A.

Feeding a Brood Mare.

Will you make out a ration for a four-year-old Pereheron brood mare? The colt is four days old, large and strong. The mare is in just fair flesh; her weight is about 1600 pounds. She will not work, and I eould give her a little grass. I want to grow the colt as large as I can. G. S.

New York.

Turn the mare out on grass and in addition feed her half rations of hay and oats. That would mean eight pounds of each per day, or a little more if she fails to keep up her eondition. It would also be well to feed the mare eut corn fodder when the grass begins to get brown or dry. As soon as possible allow the foal to liek rolled oats, and when this is eaten well add wheat bran gradually. Set the foal's feed box where the mare cannot get at it. Wean the foal when six months old, after it has learned to eat hay and the grain and bran mixture, and can live on such feed without the mare's milk. After that feed it generously through Fall and Winter to get the maximum weight and development possible at 12 months old. From that time on most of the remaining growth will be made on grass, but a little additional feed can be given to keep the eolt growing perfeetly. A. S. A.

LITTLE SISTER: "Oh, mamma, Georgie has just upset the tea table an' broken my dolly an' all your nice dishes." Little Brother (badly frightened): "Yes, mamma, an' let's be sorry, but don't let's be mad!"—Harper's Magazine.

NEW ENGLAND MILK.

THE New England Milk News says the milk business in New England is unsatisfactory, unstable, and not too promising under present eonditions. I am sorry to say every word of the above is too true. The Mayor of Boston has in mind the establishment of milk distributing stations, and the Consumers' League is studying the matter, being ready to assist if this is possible. Our Lieut.-Governor, Mr. Barry, is also very much interested in this matter, and any other plan that will help the produeers and consumers get together, work together or do business with each other in a manner of mutual benefit and profit to each other. The general opinion, among all classes who have been or are interested in the situation, is that the produeers need no champion, but are able to eontrol the situation and make matters satisfaetory if they only get together and stick together. Mr. Barry says: "It is up to you who make the milk to say what we, the eonsumers, shall pay for it, but you let some one else do this and we let them tell us also what we must pay, and so it goes." Just how to remedy this is not clear, but it must and will be remedied. In three months' time, the farmers' organization has grown to a thousand members, most of these in New Hampshire. Work in Vermont and the other States will inerease this largely in the next few months and will be pushed aeeordingly. The H. P. Hood Milk Co., not being satisfied with the amount of milk signed for by register prior to April 1, after that date sent out eireulars stating they would buy any milk sent and pay all the market would allow, based on Chamber of Commeree quotations of butter, and also allow all the value they eould get out the skimmed milk for manufaeturing purposes. It is stated this company has now signed up praetieally all the supply they eould get on different agreements as suited the cases. This shows they want the milk.

This firm on the Newport-Wells River, Vt., car, pays $1.40 per hundred pounds, at a station on the Lunenburg line $1.41 per can, containing 85 pounds of milk. In the section about Whitefield, N. H., the following prices are stated: May, 23 cents per 8½-quart can; June, 21; July, 26; August, 31; September, 31; October, 31; average, 27 1/6 for season. Last year the average priee was 28 1/6 or one cent per ean higher. This difference in priees, however, has been got around by the eompany in this manner. The produeers are allowed the privilege of seoring themselves on this basis three quarters of a eent on eooling of milk, one-quarter on whitewashing barns; one-eighth on light and spaee in same, one-eighth on having milk-room away from stable, whieh would bring the priee up to 28 5/12, or one-quarter cent per ean better than last year's price.

Another interesting faet is that contraets as the rule in Northern New Hampshire and Vermont run from May 1 to November 1, while those in the southern seetions run from April 1 to Oetober 1. Compare the above prices with the offer of the Deerfoot Farm Co., of Massachusetts for nearby milk, whieh is what they wish to handle if possible altogether, if the consumers will appreeiate the same. This offer is not for all they buy, but is a new policy to be tested out to see if the idea is praetieal with a part of their supply, and if found successful with part will be used alltogether as soon as possible to aecomplish it. They say:

"We are willing to make a trade for your milk for one year at our Northboro Station at the following priee and under the following eonditions: April 35 cents per 8½-quart can; May and June, 29; July 34; August 36; September 36; October 40; November 42; December 42; January 40; February 38; Mareh 38. Average for Summer, 33 eents; for Winter 40. This applies to standard milk, clean and properly taken care of. We will pay a premium above this of two cents per ean for milk from stables seoring 60 pounds or better, and will average below 50,000 bacteria per eubie centimeter and test 3.80 per eent. butterfat or better, and we should like all our supply to be up to this grade. Further, for every dairy sending us as much milk in September as in April, as much in October as in May, and as much in November as in June, one cent per can extra for his whole produet. Or for an inerease in these months of 10 per eent. two cents per can, for a 20 per eent. inerease three cents per ean, and at the same rate up to five cents per can for a 40 per eent. increase."

This looks like a satisfactory and alluring offer, the test will show how it works out. The prices of the Whitings are reported very unsatisfaetory from all seetions heard from. One dairy in our own town, whieh sells to one of these firms, receives only 22 or 23 eents per can, I am told. Their price at Sunapee, N. H., is quoted as follows: April 28; May 22; June 22; July, August and September, 28; an average of 26 cents at the car. As some of these people pay four cents per can for delivery to station you ean see what the net priee is to this section. One of the Granges of this section bought a ean of milk from this company at the depot and was charged 56 eents per can. What a raise in value after reaching the contraetor's hands! A. E. P.

SANITATION

would have saved a great many of the 7,420,912 hogs valued at $59,455,700.00 lost in United States during 1913 from

HOG CHOLERA

You can make your hog pens sanitary if you use

KRESO DIP No. 1

The Standardized, Reliable Dip and Disinfectant.

We will send you free a booklet on the treatment of mange, eczema or pitch mange, arthritis, sore mouth, etc.

We will send you free a booklet on how to build a hog wallow, which will keep hogs clean and healthy.

We will send you free a booklet on how to keep your hogs free from lice and parasites and disease.

Write for them—they are free.

KRESO DIP No. 1 has been used at the large state fairs in the United States for the last ten years to prevent the spread of contagious disease. It has done it, and KRESO DIP No. 1 will do the same for you on the farm.

KRESO DIP No. 1 is Easy to Use—Reliable—For Sale by All Druggists—Effective—Not Expensive.

Publishors The Rural New-Yorker:

Gentlemen: I beg to say that I received the New Farmer's Handy Knife and Tool Kit. It should be called, "The Farmer's Master Knife," and I have not words to express to you my appreciation for so valuable a reward. It can be used in so many different ways. Just the other day, while out at work on the farm, a screw got loose in my corn planter, but with the Tool Kit in my pocket no time was lost in hunting a screwdriver. We think every farmer should have one and keep it in his pocket. Don't see how you can afford to give so valuable a reward for so little work. Thanking you for sending me so valuable a reward, and wishing to be able to further increase the circulation of The Rural New-Yorker. Yours truly,

WINFIELD HOPSON,
R. 1, Box 16, Washburn, Tenn.

All of our Rewards have equal merit. :: Send for Reward List and Sample Copies to

THE VALUE OF A GOOD DOG.

NELLIE had already saved two lives, but she willingly gave up her own recently to rescue our two-year-old baby. Severely crippled, the plucky collie lay by the side of the railroad and wagged her tail at those who came to pat her on the head and praise her. Last Summer, when two little boys grew tired of wading in shallow water and decided to try the "old swimming hole," Nellie rendered prompt and efficient help. James and Ralph had been warned not to enter the deep water of the old mill pond, but they forgot the warning and entered. They soon found themselves in water beyond their depth and shouted for help. No other help was near at hand but our intelligent collie lying on the bank. Nellie seemed to realize the serious situation at once and plunged into the water. She bravely caught Ralph by the hair and swam near enough to James so that he caught hold of her long wooly hair, and so succeeded in dragging both boys from a watery grave. A neighbor on a distant hill also heard the shrill cry of danger, but he did not reach the scene until Nellie had the boys, out of danger and into shallow water.

Our little two-year-old baby recently wandered from its mother into the front yard, through the open gate and upon the tracks of the railroad that passes the house. She had found a piece of iron and began to play with it there on the track. A fast train was approaching and as soon as the engineer saw the baby, he made a determined effort to stop the train, but he was too close before he saw the little form. Nellie was near enough to see and realize the imminent danger of little Grace. She dragged the baby by her skirts from the track as the express shot by. In doing so, however, the pilot of the engine struck Nellie a most vicious blow, crippling her beyond help. As the conductor and several passengers ran back to the point where the child lay, crying but unhurt, they found the faithful dog slowly dying, yet she made a feeble effort to wag her tail as they patted her on the head. As the father came upon the scene, he caught his little baby from the arms of a stranger, kissed and hugged it to his breast, but as he stood and beheld the dying gasp of his faithful collie, he broke down and wept.

Most people, I believe, are agreed regarding the value of a good canine sentinel. And those of us who keep a good dog on the premises, never realize, perhaps, how often thieves pass us by because they know we have such a watchful dog about the place. Some years ago, chicken thieves made numerous raids in our county. They had come from a city 40 miles distant. It seemed strange at the time that they took all of Mr. A.'s poultry, but none from Mr. B. On investigation it was found that Mr. A. kept no dog, while Mr. B. had a good canine sentinel. In some mysterious way they had secured this information in advance and did not disturb the poultry on a farm where a good dog was kept. A certain widow kept a good lock on her poultry house but no dog. The strong lock proved no barrier for the thieves as they quickly drew the staple. Mr. K. considered his smokehouse close enough to his dwelling and so thought it unnecessary to lock it. Neither did he keep a watchful dog. Just after the holidays, some thief or thieves entered his smoke house and took all his meat and lard, leaving his scarcely a bite.

However, while we are keeping a dog, would it not be the part of wisdom to keep a good, purebred dog? It costs no more to feed a purebred dog than to feed a mongrel, while a purebred dog will bring in considerable revenue each year. During one year we have sold puppies to the value of $60 from one purebred collie. The writer recently placed this small eight-word advertisement one time in an agricultural paper: "Scotch collie pups, beautifully marked, price very reasonable," and 44 replies were quickly received. Hence, while you are keeping a dog, you might as well feed a purebred rather than a mongrel, for it will pay in many ways. P. C. H.

North Carolina.

FIGG: "The way of the transgressor is hard." Fogg: "Yes; but the trouble is it is generally hard on somebody else."—Boston Transcript.

Training a Dog.

WILL you tell me how to train a collie dog properly to work stock and be generally useful? S.

You have given me a hard "nut to crack," in fact it is a stone. The first thing that must be done in the the case of the inquirer is to train the trainer. No one but an experienced trainer can teach a dog to work rightly and successfully unless, as it sometimes happens, a man has an extra well-bred and sensible dog and has some natural ability in training, himself; then he can make a fairly good dog. The thing, however, for the inquirer to do is to locate a really good trainer and then hire him to take the dog and teach it to do what he wants it to do if he cannot do it himself. Asking how to teach him is a good deal like writing a linguist and asking him to tell you how to teach your child to speak Italian, Spanish, or some foreign language that you are unfamiliar with. I might be able to teach the man's dog to do most anything but talk and read, but I could not tell him how any quicker than I could tell the dog, and then unless he had some natural ability he would finish second to the dog.

There are several books published on training which might be of use, but I think the proper way would be to get a real trainer to teach the dog. You will find trainers advertised in sporting magazines, but I would insist on a man giving me reference as to his ability, for there are many men who are so-called trainers who know very little about it.

Illinois. R. F. JOHNSON.

AILING ANIMALS.

Poor Milking Sow.

Would you advise breeding an aged sow that has large litters, but last one, four weeks old now, she gave very little milk first week or so, lost all but seven pigs which are fine. I thought she caught cold. She is in good health and flesh. B. J. D.

It is a mistake to retain such a sow for breeding. She is a poor milker and will not be likely to prove a better milker at the second farrowing. One cannot afford to run chances, however, and it always is the best policy to breed from a sow that is known to be a good mother and good milker. The young sows bred for the first time should be from sows of established merit as breeders. A. S. A.

Knuckling.

Is there any cure for a horse that has a so-called cockle joint? The cord of its hind leg has so contracted that it cockles over badly. Some say that the cord can be partly cut and thus lengthened. Is this so? Will it do to feed a horse silage and how much? G. B. G.

Connecticut.

"Knuckling" or "cocked ankle" when confirmed can only be remedied by the operation of tenotomy, which consists in the severing of the flexor tendons. This can be only done by an expert graduate veterinarian. Other treatment will not be likely to help. The horse may take a little well-preserved silage daily, provided you feed it along with best Alfalfa or clover and Timothy hay. It must not be moldy, for moldy silage kills a horse as sure as a shotgun. Ten to 15 pounds may be fed daily while the horse is idle, but when he has hard work to do better omit silage. A. S. A.

Ailing Goat.

I have a goat eight years old. One month ago she had four kids. She does not seem well, eats little, and has an enlargement on right side between point of hip and last rib, which floats about when touched. What is it? E. S.

New York.

An enlargement that "floats about" when handled suggests an abscess containing pus, or possibly, a rupture. Without an examination we cannot say which is present, but if it is a rupture it should prove possible to work the bowel back into the abdominal cavity. If it is an abscess it will "pit" when pressed, like clay or dough, and will be painful when so handled. In an abscess a soft spot can be found and on pressure one can determine the presence of fluid under the skin. It would be well to have an examination made by a qualified veterinarian. A. S. A.

Collar Tumors.

A horse about eight or nine years old has a lump on his neck where the collar goes and it is getting sore. Can you tell me how to get rid of it? C. J. R.

Pennsylvania.

Have the tumor cut out and then treat as a common wound. That is the only successful treatment for such a condition. Also cut out the hard, horny center part of the sore on the top of the neck. That is called a "sitfast" and permanent healing will not take place unless it is removed. Wet the wounds several times a day with a lotion composed of one ounce of sugar of lead and six drams of sulphate of zinc in a pint of water. Label the bottle "poison" and shake well before use. A. S. A.

Swelling on Neck.

I have a valuable mare with a growth coming on her neck. Our veterinarian says it is on the gland, and he thinks it will kill her; he said the only remedy was to cut it out. It is about as big as a man's head; it extends from her ear down to her throat. She can swallow some; it affects her breathing. Could you tell me if there could be anything done? J. C.

Pennsylvania.

An abscess of the parotid gland no doubt is present and it should be opened by a graduate veterinarian for evacuation of the pus contained. This can be done without any special danger to the mare, if the operator is experienced and careful. After treatment will consist in keeping the cavity clean and injecting tincture of iodine two or three times a week, to stimulate healing and closing of the cavity. The cavity also should be packed with antiseptic gauze or oakum saturated in a mixture of equal parts of turpentine and raw linseed oil. We merely give these as suggestions, but our opinion cannot be quite confident without making an examination. A graduate veterinarian will know what to do. A. S. A.

Indigestion.

A horse purchased this Spring is a poor feeder; i. e., will not eat sufficient grain to keep her in good condition. When not working she eats fairly well although she will not clean up her feed at meal time. She seems to crave dirt, and I give her what she wants. I have been advised to feed molasses. Is that good, and if so what quantity should be fed? When given a hard drive or day's work she will not touch grain. Can you advise something to give an appetite? New York. J. P.

Have teeth attended to by a qualified veterinarian; then feed whole oats, wheat bran and mixed hay. Horses such as you describe usually are nervous, narrow, long coupled animals, and poor keepers, not to be helped by medicine. If not of that type mix in the feed twice daily a tablespoonful of a mixture of two parts of powdered wood charcoal, and one each of bicarbonate of soda and powdered nux, gentian root and fenugreek. Do not feed molasses. It is only used for thin, rundown horses. A. S. A.

Cough.

I have a Jersey cow about 13 or 14 years old; she is in good order and has never been dry since she was fresh, when two years old. She has something wrong with her breathing. I had her examined by a veterinarian; he said it was bronchitis, but left no medicine or prescription. She coughs some, but it seems to come only from the throat. She will be fresh in July; gives about five quarts milk a day. She eats well and is sleek-haired, but if driven fast she breathes like a person with asthma. Can you tell me anything to do for her? She has been fed on clover hay and fodder; oil meal, corn chop and bran in slop morning and evening. D. M.

Pennsylvania.

There is every reason to suspect that the cow has tuberculosis affecting her lungs or throat, and she should at once be tested with tuberculin. Any graduate veterinarian can properly apply the test which is absolutely harmless to a well cow, and is the only reliable method of determining the presence of tuberculosis. A. S. A.

Paralysis.

We have a sow a year old with her first litter of five pigs four weeks old. About three days before farrowing we put her in a barn with a board floor kept dry and clean, with plenty of ventilation. Two days ago we noticed her hind legs getting stiff, so we put her and pigs down in the pen. The next day she was in great pain and her hind legs are helpless. We feed bran and wheat middlings three times a day. We have heard of similar cases in this locality and no one seems to know the cause. We ask for your advice. G. C.

Ohio.

This condition is purely due to lack of exercise and overfeeding. Sows from breeding stock similarly pampered are most likely to suffer. Stuffing hogs on corn is most liable to cause the trouble. At all times growing and breeding hogs should be made to take abundant exercise and should be fed mixed rations. Adding 10 per cent. of tankage to the feed tends to prevent rickets and paralysis. Wean the pigs. Feed the sow light laxative slop and rub her loins with liniment. She possibly may recover, but the chances are poor. Kidney worms do not cause this condition. It is similar in nature to the disease known as parturient eclampsia in female dogs. A. S. A.

Roof Protection at a low cost against Fire, Storm and Lightning

The danger from lightning can be avoided, roof fires never occur, and the weather is kept out when your buildings are roofed with

Kanneberg

Metal Shingles

"We Pay the Freight"

Lightning never damaged a Kanneberg shingled roof, because they are fire-resisting. Rain, snow, heat and cold stay outside. Kanneberg Shingles need no repairs, because they resist rust, don't rot, crack, buckle, curl, nor fall off. Can be laid on low-pitch roofs and always look well. Give clean cistern water.

FREE—Send for our big catalog at once and you'll SAVE BIG MONEY on roofing and you get the best protection. Take advantage of our LOW FACTORY PRICES. Catalog shows many designs and sizes.

Kanneberg Shingles come singly, 8 to a sheet, or in clusters 2 feet by any length from 5 to 10 feet. You can put them on quickly. Easy to lay.

Write for catalog and give dimensions of roof, so we can show you how little it will cost to get perfect roof protection for years.

PUBLISHER'S DESK

THE service we are able to render subscribers is appreciated more and more by them, as one after another gets in touch with it. Here is one:

I am calling on my old stand-by, as it seems you are the only one I can depend on to help. MRS. J. W. E.
West Virginia.

Here is another from the same mail:

As you seem to be about the best place I have yet found where good sensible advice without frills will be given without hesitation, I kindly ask for the following information. B. M. C.
Tennessee.

It is no conceit on our part to print these letters. Personally we may not be as wise or as sensible or as well informed as some of the people who ask for information; but we have a great big organization that stretches around the world. What we do not know ourselves we are in a position to find out. We can afford to get it because we get it for 160,000 people. No man could afford to go to the expense to gather it for himself. Our people come back to us for it because they have found our facilities are good to get what is reliable, and the latest and best to be had. You pay all we ask for it when you renew your subscription, and we are glad to have you call on us freely for it, at any time.

I note that you have mentioned the Luther Burbank Society. Some weeks ago I was elected an "Honorary Member" of said society, and was all "swelled up" until I was asked to contribute $81 for a set of books! Not me! M. J. G.
Iowa.

Whoever has engineered the Burbank game understands that element of human nature known as vanity. We have probably all got some of it; but it is so closely allied to honest pride and self respect that we may not accuse ourselves too severely provided we keep it within the $81 limit. Yet the success of the Burbank scheme depends on the number whose vanity exceeds the limit.

Please enroll me as a member of the Dr. Ulman Club. S. A. C.
New York.

The Anti-Fake Club is growing. We are now quite sure of being able to effect an organization. We believe it will have a great influence in promoting clean publications, and honest advertising.

The Postoffice Department has issued fraud orders against George Maurice and the Bond Certificates Club of Geneva, Switzerland, whose lottery literature has been addressed to some of our subscribers. We sent the literature promptly to the Department. No time has been lost in cutting them out of the U. S. mails. We are glad to see the "fraud order" in use again. It is about the only effective means to shut off crooks before they get the people's money.

Is this proposition from the Colonial Motion Picture Corporation a fake?
Connecticut. A. A. Y.

This subscriber received invitation number 615 with the information that only 30 citizens of his State may acquire the ownership in the corporation and receive the cash profits to be derived from them. Further particulars are promised on request; but we have enough. In our judgment the remainder of the citizens of Connecticut are fortunate that their vanity and avariee are secure from the allurements of the proposition. It is hard to prove that some things are fakes until they have had time to develop. The proof comes only after some one has lost his money; but we all have the privilege of an opinion based on experience; and to say the least, the proposition does not appeal to us.

The Monaton Realty Investing Company, New York City, was organized in 1907. Their methods were criticised in THE R. N.-Y. six years ago, and the nature of their paper securities explained. Two of its officers are now under bail for $2,500 on Federal indictments for alleged misuse of the mail. It is charged that the losses to small investors amounted to $1,000,000. The company is in the hands of a receiver, but it is alleged that the property held by the company is mortgaged for all it is worth. It is said that the most successful agents in selling the paper of the company were two ex-ministers. They were particularly successful with servant girls and other people of small income. While these operations were under way, the president of the company, now under indictment, was drawing a salary of $10,000 a year.

I received the inclosed letter from the Thwing Company, 141 West 45th Street, New York, today. I invested $50 in the Circle magazine when it first came out. Since the first failure, I have taken THE R. N.-Y.'s advice and have not sent an extra cent to Thwing, though he urges me frequently to do so. H. V. C.
Pennsylvania.

The Circle magazine died. The Success Magazine died. Its only success was in getting easy money from credulous people. An attempt is now being made to reinstate the two corpses into one publication. There is no great objection to that except the scheme to get the old victims to put in more money on the theory of getting back what is already lost. In this letter Mr. Thwing repeats the old E. G. Lewis scheme of one hundred founders; and promises them one hundred per cent profit. Our correspondent is wise in taking his $50 loss good-naturedly, and in resisting Mr. Thwing's allurements for further remittances.

You will find enclosed a contract of the Wheatley Heights Estates which was given to me for my signature, but I did not sign it; thought I would consult you first. Their plan is to give the party of the first part the land free of any charge, and the said party is to pay them $5 per front foot of each lots. The lots are 25 by 100 feet. Will you please answer this in the columns of THE R. N.-Y., so some one else won't get "bit."
New York. W. S. M.

This scheme of "giving away" one lot on condition that you buy one or more lots adjoining, and put up cash for alleged improvements, has been worn threadbare by Long Island promoters. No one need have any delusions but what they will pay a price covering the present value and any possible increase for 10 years to come for any lots bargained for with these promoters. A subscriber recently came to us for information regarding two Long Island lots purchased in 1908 for $1,000. The best estimate we could get shows the two lots are worth about $500 now. This, we believe, is a fair sample of the basis of value of most of the Long Island land schemes. A large percentage of the lots on Long Island sold by promoters are later taken over by the State for taxes.

If the present interest of farm women in their department of THE R. N.-Y. continues, Hope Farm, Publisher's Desk and other departments of the paper will all have to acknowledge the Woman and Home section as most popular. THE R. N.-Y. has always had loyal support from the good women of its visiting homes; but it never before received in a whole year the correspondence from women that now comes in a single month. It must be remembered that we are only just beginning the development of this work. We admit we do not know yet just what our women want; but we have an idea. We want this department of the paper to be just what the American farm woman wants; and as nearly as possible edited by herself. When you have finished reading this number, write us freely what about it you like or dislike and what it should have to interest and help you. We have talent enough in the Rural family to edit the best woman's magazine in the world; and we propose to find the talent, and to publish the magazine.

The farmers of Millville, Cumberland County, N. J., allege that they have been duped by a Philadelphia concern which last Spring signed an agreement with them to act as their commission agent in the city markets and eliminate the middlemen. The farmers claim that they paid $50 each to join the combination and agreed to turn over to the agent all their produce. The farmers who shipped to the commission men their strawberry crops have just learned that, instead of being sold at a good profit, the fruit was sold to canners in other parts of the county. Some of the farmers say that under the new system they received an average of $2.50 per crate, while in previous years their returns have been from $3.50 upward.—Local Paper.

We cautioned New Jersey farmers against a scheme of this kind during the past Winter. Marketing his products is the most difficult problem that the farmer has to solve. So long as he leaves this work to others, so long he may expect losses. When he undertakes the work in a modern way for himself he may expect some measure of success. When producers organize themselves for their own benefit, they can well afford to put up $50 or more to do business; but when farmers permit themselves to be organized by schemers for the benefit of schemers, and put up $50 to finance the scheme to swindle themselves, they must expect to reap the fruit of their own folly.

J. J. D.

Cleaning a Cistern.

ADVISE me about my cistern. It is cement and under ground, out of doors. The water is not used in Winter, and when the family comes back to the country in Spring the cistern is always full, but the water smells as though there were something dead in it. As a matter of fact every time it is cleaned there is something dead in it, usually a rat or two. Z. R. C.
Bernardston, Mass.

Cisterns for the storage of water to be used for drinking and cooking purposes are unsatisfactory, at best, as they are very liable to contamination through leaky walls, and always contain more or less organic matter and other impurities carried down from the lower layers of the air and from roofs, gutters, etc., by the rain water. Where the walls are of brick or concrete and are vermin proof, and the top is screened, vermin may find entrance through the inlet or outlet pipes, and these should be screened also. Cistern water may be greatly improved by filtering it through a wall of porous brick made to divide the cistern into two compartments, or it may be made to pass through an outside filter of sand before being admitted to the cistern. Certain chemicals are also added to impure water to purify it for domestic use; among them being alum (alumina sulphate) and potassium permanganate. About six grains of the former to the gallon of water are added and this results in a coagulation of the impurities which then settle to the bottom and permit the purified water to be drawn from above. A shunt by which the first rain falling upon the roof may be diverted from the cistern will also keep out a great deal of dirt. Underground cisterns should be well ventilated and the water may be aerated by churning it up and down, to its improvement. If you cannot filter the water of your cistern, I would suggest that you, at least, make arrangements with some trustworthy person to empty and thoroughly clean the cistern, and also to clean the roof and gutters supplying it, early enough in each season to insure your family a supply of comparatively clean and fresh water for the Summer. Care should be taken to have no privy vault near the cistern and slops should not be thrown upon the ground in its vicinity. Boiling the water from it for five minutes will render it safe from any disease germs which may have found access to it.

Canada has made the following pure advertising amendment to the Criminal Code:

"Every person who knowingly publishes or causes to be published any advertisement for either directly or indirectly promoting the sale or disposal of any real or personable movable or immovable property or any interest therein, containing any false statement which is of a charaeter likely to or is intended to enhance the price or value of such property or any interest therein or to promote the sale or disposal thereof, shall be liable upon summary conviction to a fine not exceeding two hundred dollars or to six months' imprisonment, or to both fine and imprisonment."

Products, Prices and Trade.

Wholesale Prices at New York,

Week Ending June 19, 1914.

MILK.

The Borden milk schedule to producers for the six months beginning with April is as follows, compared with last year. This is per 100 pounds in the 26-cent zone. For the 29 and 32-cent zones the schedule is 10 cents less for all months:

	1914	1913
April	$1.40	$1.50
May	1.15	1.25
June	1.10	1.10
July	1.25	1.35
August	1.40	1.45
September	1.50	1.55

Figuring 86 pounds to the 40-quart can the per quart price is as follows: April, 3.01 cents; May, 2.47; June, 2.36; July, 2.68; August, 3.01, September, 3.22.

Wholesale prices paid by New York dealers are running $1.41 and $1.31 for B and C. Hotels and restaurants using two to three cans per day are paying 4½ to five cents per quart

BUTTER.

An advance of one cent in top grades was made and held during the week. The lower grades are in very large supply and offered at cut prices to clear out the excess.

Creamery, extra, lb	27	@	28
Good to Choice	23	@	26

Lower grades	15	@	18

FRESH FRUITS.

Apple trade is very dull, except for special qualities. Very few desirable peaches are arriving. Most of them are small and hard, going at $1.50 or a trifle more, per crate. Red June plums from Georgia are bringing $2 to $2.50 per crate. This is a desirable commercial variety. The choicest of nearby and up-river strawberries are on hand, 18 cents being the top price noted for Gandy and fancy varieties. The general run of fair quality sells between 10 and 12, and lower grades down to five. Cherries sell at a very wide range of price, from 30 cents to $1 per eight-pound basket.

VEGETABLES.

A few old potatoes have sold up to $3, with a quite active demand. Considerable of the new southern stock is running inferior in size or quality, some lots going as low as $1 to $1.50 per barrel. Onion market very firm and higher. Cabbage running small and inferior; good heads wanted at 50 cents per barrel more than last week.

LIVE POULTRY.

Going to war is a sedentary job compared with handling live poultry in New York. In the last few weeks there have been numerous riots and personal encounters in the railroad yards, auction rooms and other places where live poultry trade is carried on. In one case a high bid at an auction started a row resulting in more or less broken heads. But most of the trouble comes from the grafters and gangs that hang around the yards. There were three fights in one day, several men landing in the hospitals with wounds from coop slats and flying hatchets and scale weights. One man lost two teeth and had his head cut open. His offense was refusing to present fowls to several of the unloaders who expect a hand-out of this sort. In some cases they cripple or kill some of the birds when handling, throw them in the dead heap and get their graft in this way.

The Georgia peach crop is expected to exceed 5,000 carloads.

*

The Montana wool crop will be about 26,000,000 pounds, or four-fifths that of the previous year.

*

Interest and dividend payments July 1, will amount to about $268,400,000. Of this amount $91,000,000 will be from industrials, and the bulk of the remainder from railroads.

Canadian Crops.

Winter wheat in Ontario is rather spotted owing to damage from heaving. Clover also suffered from the trying weather of April and Alfalfa has come out worse than clover. Peaches in the Niagara district are practically all frozen. In Essex, Kent and Lambton the injury has been less. Apples, pears, cherries and plums and small fruits are promising. There was a bad infestation of tent caterpillars in York and counties to the east.

June 9. Hay $17; straw $11; wheat 90; rye 65; corn 75; oats 50; butter 28; eggs 20. S. B.
Harlingen, N. J.

June 15. Cows from $50 to $80; milk 2¾ cents per quart; hogs high, 10 and 11 cents; wheat 95; rye 75; corn $1.50 per cwt., shelled; eggs 22; butter 30; chickens 30 cents per pound; potatoes $1.25.
Flanders, N. J. J. S. Y.

June 11. Frost has shortened the apple crop considerably in Nova Scotia. Along the river the whole crop seems blasted. On the side hills a fine crop will be obtained. Gravensteins will be short. Crop looked like 2,000,000 barrels, likely will be reduced to 1,250,000 barrels and perhaps less. J. B.
Berwick, N. S.

June 12. Good fat steers, 1,200 pounds and up, from seven to eight cents live weight; then a chuck roast from such cattle costs 17 cents a pound. Veals run from 13 to 15 and were 16 more than a month ago. Butter 16 to 25 according to quality. Eggs 20; hens 18; hay, loose, $10 to $13, baled $16.50; wheat $1. The fruit and garden crops in this locality are used on the farm. Our distance, and roads to market, prevent farmers from gardening. L. H. W.
Farmington, Pa.

June 15. Grass and oats are looking well, although rain is very much needed. Some farmers have just finished planting their silage corn. A good many are now planting potatoes. Some pieces of Orchard grass and clover will have to be cut soon, but the main hay crop will not be ready to harvest until after the first week in July. There will be considerable buckwheat sown this season. Butter brings 23 cents; eggs 20; veal, live, eight cents. P. S. S.
Maryville, N. Y.

Subscribers' Exchange

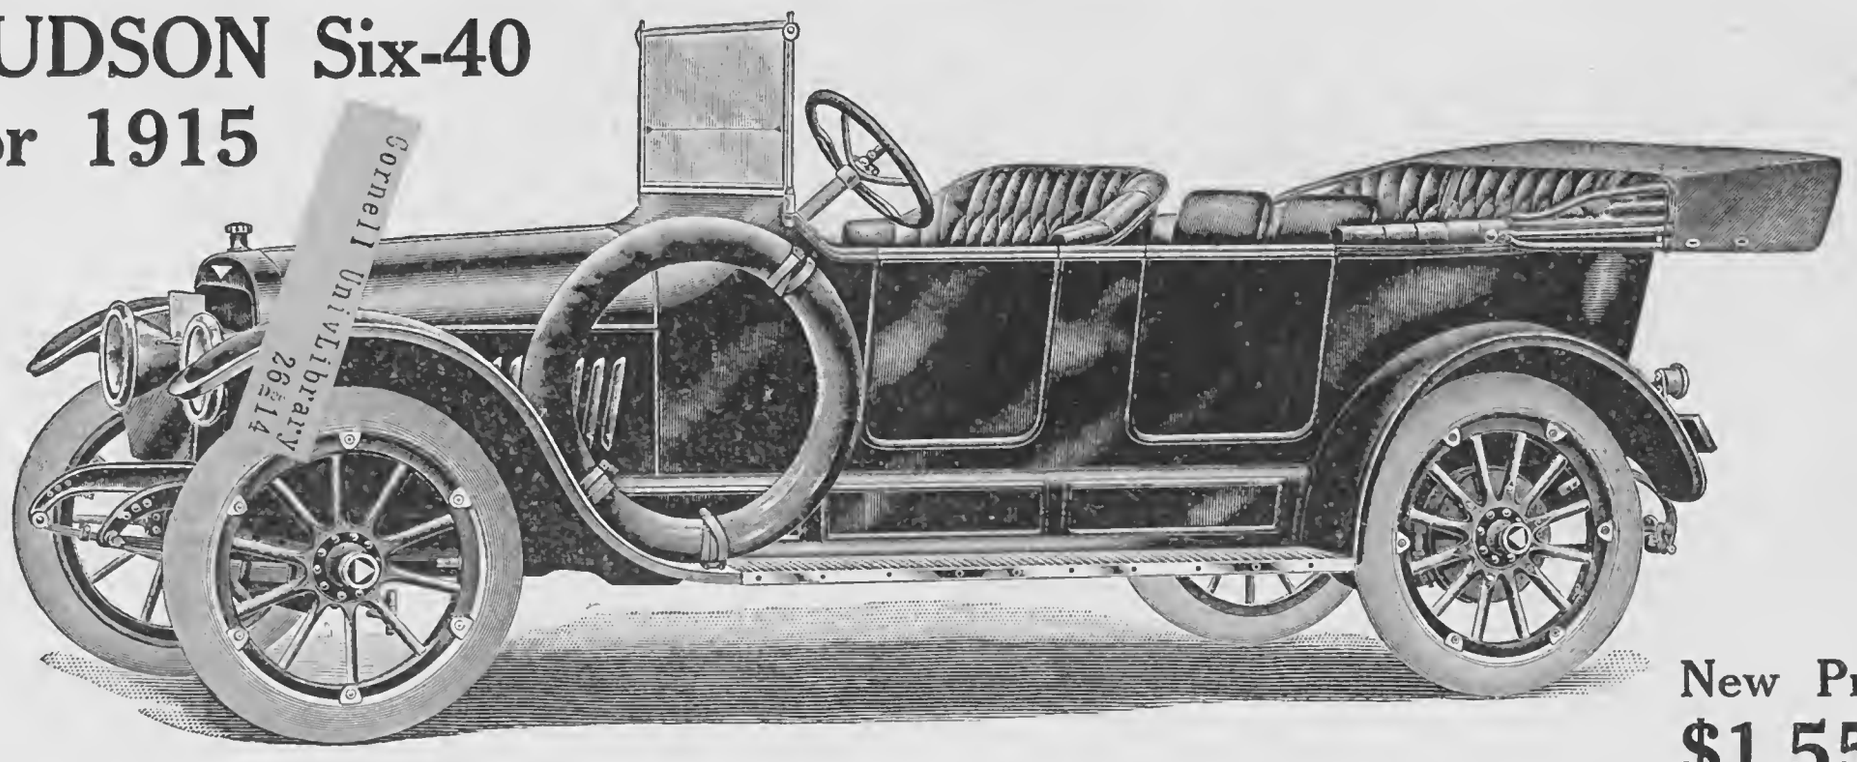
FARMERS' SECURITY BUREAU, NEW YORK Ageucy Famous for Reliable Farm Help. No Branch. SIDNEY SULLIVAN, Expert, 99 Nassau Street

The FARMERS' BUREAU an agency exclusively for agricultural help. Only first class farm help and positions solicited. References investigated. Scientific advice on farm problems. Dept. R, 150 Nassau St., N. Y. Phone, 5565 Beekman

DO YOU NEED FARM HELP

We have many able-bodied young men both with and without farming experience, who wish to work on farms. If you need a good, steady, sober man, write for an order blank. Ours is a philanthropic organizatiou and we make no charge to employer or employee. Our object is the encouragement of farming among Jews. THE JEWISH AGRICULTURAL SOCIETY, 176 Second Avenue, New York City.

HUDSON Six-40
For 1915



Cornell University Library 26.14

New Price
$1,550

The Thoroughbred

We submit this new model of the HUDSON Six-40 as the typical modern car. It reveals the latest refinements in motor car building. In any group of high-grade cars it will seem the thoroughbred. No other car in so many ways meets present-day ideals.

Our Crowning Effort

The first HUDSON Six-40 came out last year. Our 48 engineers, headed by Howard E. Coffin, had devoted three years to the model. Their effort was to embody here the final conception of an ideal car.

They established new standards in Sixes. They brought quality Sixes, for the first time, into the price field of Fours.

They brought the weight under 3,000 pounds—for a roomy car with extra tonneau seats. That was 1,000 pounds less than average former weights on cars of like capacity. They did this by skilful designing and better materials, without sacrificing strength.

They reduced operative cost, for a car of this power, by from 15 to 30 per cent. They did this by employing a new-type motor and by building a light-weight car.

They made this car one of the handsomest, one of the best-equipped cars in the world. Then we fixed the price at $1,750—the lowest price that had ever been quoted on any type of quality car.

Last Year's Record 3,000 Oversold

That car was the year's sensation. Men flocked by the thousands to it. With the largest output in HUDSON history, the end of the season left us 3,000 unfilled orders. Men were offering premiums—as high as $200—for options on this HUDSON Six-40.

In a mechanical way the car proved itself the greatest of HUDSON successes. It has run for a season in thousands of hands, under all road conditions. And not a single shortcoming developed. So our whole engineering corps, during all last year, worked on nothing but refinements.

Now a New Model

Now comes a new model with all these refinements. There are 31 new features in comfort, convenience and beauty.

And there comes a new price—$1,550. This is due to the fact that the car's popularity has compelled us to treble our output. This trebled output reduces our cost about $200 per car.

Look back three years, when every Six cost over $3,000. When high-grade cars of any type cost around $2,000. Then look at this HUDSON Six-40—a better Six than men dreamed of then—priced at $1,550. You will realize then what HUDSON engineers have accomplished for motor car buyers.

This is just the car that tens of thousands want. It is a smooth-running Six, and men want that. In size and power it marks the sane medium. In quality, beauty, finish and equipment it reveals the best that's possible. In price, weight and operative cost it marks the bottom limit for this-class car.

As an ideal combination—as a typical modern, high-grade car—you will not find a rival in sight of it. Most men will concede this—all thing considered—the top place in the motor car field.

Hudson dealers everywhere now have these new cars on show. Our new catalog on request.

31 New Features Price $200 Less

Go see the new features—the 31 refinements—which our engineers have added in the past 12 months. Then note that, with all these, the price this year is $200 less—all because of our trebled output. These are some of the attractions which you will find embodied in this new-model HUDSON Six-40. And some of the best of them are not yet found in any other car.

A distinguished streamline body.
All hinges concealed.
Gasoline tank in dash.
Extra tires ahead of front door.
Seats for up to 7 passengers.
Extra tonneau seats, disappearing.
Hand-buffed leather upholstery.
20-coat finish on body.
123-inch wheelbase.
Wider seats—higher backs.
More room for the driver.
"One-Man" top, with quick-adjusting curtains attached.
Integral rain-vision windshield.
Dimming searchlights.
Simplified Delco starting, lighting and ignition system.
Simplified wiring in metal conduits.
Lock on ignition and lighting switch.
Far better carburetion.
Speedometer drives from transmission.
Automatic spark advance.
Tubular propeller shaft.
All instruments and gauges within reach of the driver.
Trunk rack on back.
Still less weight—2,900 pounds.

New price, $1,550 f. o. b. Detroit. Standard Roadster, same price.

Our Larger Six-54

The HUDSON Six-54—built on the same lines, with 135-inch wheel base and greater power—sells for $2,350. It is for men who want a big, impressive car.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. LXXIII, No. 4262. NEW YORK, JULY 4, 1914. WEEKLY $1.00 PER YEAR.

THE NEW DEAN OF THE AGRICULTURAL COLLEGE.

Message of Dr. Beverly T. Galloway.

DR. GALLOWAY, the new Dean of the New York College of Agriculture, will take up the duties of his new office on August 1. He is not personally known to many of our farmers, and we felt that a note of introduction would be timely and appropriate at this time. So we asked Dr. Galloway if he cared to make an introductory statement upon taking up his new work, and offered the services of THE RURAL NEW-YORKER as a medium for the introduction. In response to this, Dr. Galloway prepared the following statement, which we take pleasure in putting before our readers:

TO THE FARMERS OF NEW YORK:

You have asked for a message to the farmers of the State of New York. I am pleased through you to give this message. I want it to be a message of hope and abounding faith as to what the future holds in store for agriculture. I want it also to be a message of appreciation of the efforts of those who have struggled long and earnestly for the betterment of agriculture. Men like Dr. Bailey and Dr. Jordan need no commendation from me. Their work stands a monument to their unselfish zeal and the ideals for which they have labored. They have had profound influence for good in New York State, and profound influence for good in the nation at large.

To all institutions within the State charged with the betterment of agriculture I extend greeting and the sincere hope and wish that the good work they are doing may be continued and broadened. The College of Agriculture of Cornell University will ever stand ready to coöperate with all institutions within the State to the end of co-ordinating agricultural activities so that the farmers and all others whom we serve may reap the fullest benefit, and may be led to still further aid the cause.

The world is in the midst of a mighty surge of public sentiment demanding all kinds of reforms and all kinds of action to advance the cause of the man on the land. Any consideration of the question as to what is to be done for agriculture in the State of New York must be visualized from the world's point of view. The world is suddenly waking up to the fact that food and clothing must be supplied to the teeming millions of its people. The world is also waking to the fact that with the growth of democracy the man who supplies the food and clothing from the soil will be content no longer with the life of the peasant or the serf. America has developed a type of farmer differing in many respects from any others found in the world. Intelligence and individualism are his marked characteristics. He is now beginning to feel the need of organization and combined effort in meeting the problems before him. The problems in New York State, or in any other State for that matter, are not those of mere production, or the mere disposal and distribution of the things produced. In a broad sense they have to do with socializing the man on the land, of bringing to bear all those forces which the State may properly bring to bear to give him an even chance with other men whose labors fall in different fields. Education is the key to the situation, but the education must be sound, otherwise our efforts will fail. No sane man would attempt at this time to blueprint a final plan of rural education. We can feel our way only as we get the ground swell coming from the millions of people demanding light and help.

I hope to see the State College of Agriculture in the forefront of every movement looking toward the training of leaders in rural affairs. No good work can go on without leadership. The College of Agriculture in a great university is the place to train them. They must be gifted with knowledge and experience for leadership, and enriched with the highest ideals of living. The atmosphere of a great university begets these things. The association of different classes of students makes for breadth of vision and appreciation of the work for the world at large. Obviously no college can hope to teach or train successfully for any great length of time unless it is developing a reservoir of knowledge from which to draw. Research creates this reservoir. Research is the steadying force that holds the earnest worker to the truth and the highest ideals in all things. But truth must be vitalized and used, and here again the college has an important duty to perform in bringing its work for agricultural betterment into every community and every farm home of the State. The farmers' needs are multiplying, and will continue to multiply with advancing civilization. The farmer wants a fair share of the profits of his labor. He wants home comforts, and he wants to be brought in touch and to keep in touch wtih the world's affairs. He is not a supplicant or a mendicant. He asks for nothing he is not entitled to receive. The college must appreciate all of these things and more, and to do so its leaders must get close to the heart of the people, and must never forget for an instant the interests of those they serve. BEVERLY T. GALLOWAY.

BEVERLY T. GALLOWAY,
DEAN OF THE NEW YORK AGRICULTURAL COLLEGE.

Beverly Thomas Galloway—His Work.

He was born in Millersburg, Mo., on October 16, 1863. His father, Robert M. Galloway, was a native of Kentucky, a farmer and miller. Soon after the Civil War young Galloway came with his parents to Columbia, Mo., the site of the State University and Agricultural College.

Galloway completed the usual minor school course, and began work with a view to qualifying as a pharmacist. In 1880 he gave up this work and secured a position on the horticultural grounds of the Agricultural College. He turned his attention especially to intensive lines of horticultural work, principally floriculture. In those early days there were no experiment stations and very little money for the conduct of any kind of experimental work. It was required of most of the agricultural and horticultural departments that they be self-supporting. This was the case at Columbia, and Galloway's early work was connected with organizing the forces of the institution, and shaping them so as to be financially successful. He spent four years at the institution, graduating from the College of Agriculture and specializing afterwards in several lines of work at the State University.

In 1884-85 he was selected to collect agricultural, botanical, and other material for the New Orleans Exposition. He spent the Winter of 1884-85 in New Orleans at the Exposition. In 1885 he came back to Columbia and entered the horticultural department, and was put in charge of the general greenhouse work. This time he began to specialize in plant pathology, securing what help he could from one or two outside institutions, the only ones of the kind doing this work in the United States. He began to prepare and present papers at State horticultural meetings and to publish practical instructions in the matter of preventing plant diseases in the local papers of the State. This work he continued until 1887, at which time Congress made a small appropriation for the study of plant diseases by the Department of Agriculture. He came to Washington in the Summer of 1887 as Assistant Pathologist in the Section of Mycology. This section had a small organization for the study of plant diseases, with an appropriation of $6,000 or $7,000. A year later the chief of the section resigned, and Norman J. Colman, the then Commissioner of Agriculture, appointed Galloway as his successor. Immediate steps were taken to place the work on a new basis, special attention being given to field demonstrations and experiments. About this time the State Experiment Stations were organized, and through coöperation with them and with farmers, fruit growers, vegetable growers, and others, there was rapidly brought up the science of plant pathology. The work grew and extended, and was rapidly developing when Secretary James Wilson came to the Department.

About 1900 it became evident that the Department should be reorganized if proper growth was to be secured. Galloway was instrumental in bringing this about through the organization of four large bureaus—Plant Industry, Forestry, Chemistry, and Soils. All of the plant work of the Department was brought into the Bureau of Plant Industry, and from that time the growth of the Department was rapid.

The Bureau of Plant Industry has grown from a comparatively small institution until it now has a force of something like three thousand men, and spends nearly three million dollars a year in its work. The work of the Bureau covers practically all fields of crop production, and more recently it has extended its activities into the field of economics, especially as affecting crop distribution and marketing.

In 1913 Galloway was asked to take the position of Assistant Secretary of Agriculture, although he was not an applicant for the place. There was no political significance whatever in the appointment. A great deal of the work of the Department during the past year has been redirected and a spirit of hearty coöperation developed. Special efforts have been made to bring the Department into closest sympathy and coöperation with the agricultural colleges and State experiment stations throughout the country. This spirit of friendliness and coöperation has resulted in the shaping up and final passage of the Smith-Lever Extension Bill.

SCIENTIFIC PRODUCTION OF FINE APPLES.

From Plowing to Packing.

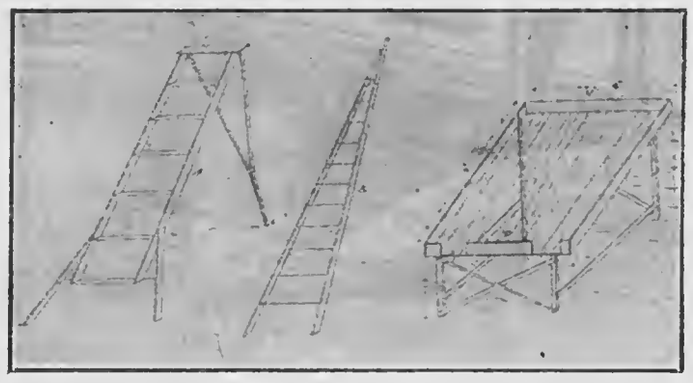
PART III.

BARRELING.—Apples may be barreled in the orchard or in the packing shed as they are picked, or else placed in temporary storage and barreled on bad days during the picking season or later as they are marketed. In any case success in the entire process depends largely on the care and attention given to the picking, handling, and grading of the fruit, the quality of the barrel used, and the neatness and honesty with which the fruit is packed. Failure to properly look after any one of these is quite sufficient to change success into failure.

PICKING THE FRUIT.—The proper degree of ripeness is the most important consideration in picking the fruit. With varieties which have more or less red, color is usually the main guide. That is, such varieties should have developed their full normal color and full normal size, unless for some unusual reason full size or full color is obviously impossible. A condition sometimes spoken of as hard ripe is quite expressive, and means that the fruit should have full color and full size, but with the flesh showing no sign of mellowness. With the Winter varieties the seeds are usually brown under the above conditions, and this, along with size, is usually the final test of maturity in Winter varieties having no red color. Fruit should also separate from the branch with comparative ease, for otherwise picking will be delayed and considerable injury will result from the breaking off of fruit spurs. Severe dropping sometimes occurs during seasons of drought, and may be sufficient cause for earlier picking, but when apples are properly grown and sprayed the amount of droppage is not likely to be a serious problem.

HARVESTING EQUIPMENT.—The character of ladder, picking baskets, packing tables and other necessary equipment is of much importance. Where the trees are not especially tall the three-legged step-ladder with side braces is the most practical. The four-legged type is unsatisfactory, because it is not adapted to uneven ground. Of the long ladders the style shown at B, in Fig. 362, is most satisfactory because it is easiest placed among the branches and is safer than the ladder commonly used. There are certain styles of step-ladders which permit of swinging the tongue over in line with the step portion, so that the whole may be used in the same manner as the long ladder. To my mind, a good substantial grade of the ordinary round half-bushel handle basket is the best utensil for picking into. It is all the better and, in fact, necessary, especially when fancy or tender varieties are being picked, to have this basket lined with burlap or some other form of padding. It is never advisable to pick fruit in a bag, because of the bruising which is bound to occur. This bruising may not show at picking time, or if the fruit is used within a short time thereafter, but it is sure to lead to inferior quality and reduced prices if the fruit is held for a later market. One Pennsylvania grower reports a loss of 50 cents per barrel due to the use of picking bags instead of baskets.

PICKING BASKETS.—A new style of picking basket, provided with a strap for about the neck and drop bottom, has recently been placed on the market. It is well padded and substantially built, and although we have not tested it thoroughly, it should prove of some value. One advantage should be that in emptying it need not be dumped—a fact which should promote careful handling, especially when emptying into barrels. If sufficient picking baskets are available they may be set aside as filled by the pickers, collected as promptly as possible and hauled to the packing table or packing house, and after being emptied returned to the pickers. Otherwise some form of crate should be provided, or in case the fruit is to be stored temporarily it may be emptied in the shipping barrels after first placing the loose heads face downward in the bottom. In any case the utmost care should be used in handling the fruit from the time it is being picked until it is finally packed in the barrels, and it should be



VARIOUS PICKING DEVICES. FIG. 362.

moved to a cool place as soon as possible. Piling in the orchard is seldom if ever advisable, because it usually leads to increased cost of handling and reduced quality.

State College, Pa.

ARRANGING A COVER CROP.

AS to the article on cover crops, page 715, is it important that vetch seed grown in about the same latitude or climatic conditions, be selected for use? Would rape be preferable to Cow-horn turnip because of the probable survival of much of it during the Winter, producing a heavier growth to turn under in Spring? Would you advise plowing a thin sod in July, sowing the cover crop you suggest in the above noted article? Then next May turn down the cover crops, and proceed as you advise for a cover crop?

P. G.

Norristown, Pa.

We should prefer vetch seed grown in our own latitude, or in a more Northern section, if we could get it. This would be very difficult to obtain, however. Most of the vetch seed now on the market appears to be imported. The plan of growing your own seed year after year is the right one. In comparing rape with Cow-horn turnips, you must remember that the rape makes nearly all of its growth above ground. It may be called a turnip run to top. The Cow-horn turnip makes a deep, large root, which works down into the soil. Both crops die out in our Northern latitudes through the Winter. A few plants will be left alive, but not many. The roots or the turnips stand the Winter better than the tops of the rape, and there will be a larger bulk of the turnip left in the Spring. In a moist season, however, the rape will make a larger total growth, and will probably add more organic matter to the soil. Our plan of late years has been to sow half rape and half turnips, thus obtaining a double crop both above and below the ground. A

HARVESTING A TALL TREE. FIG. 363.

heavy seeding of the rape will be apt to smother out the rye and clover seeded with it, and for that reason the turnips are superior. In any combination of seeds for a cover crop, we advise the use of some rye. In cases where clover or turnips are killed out during the Fall the rye will be almost sure to remain and make a fair growth. The plan you speak of will work properly, provided you can get a fair growth on your cover crops. We should use rye, Crimson clover, and either rape or turnips as preferred. It will probably be wise to use a quantity of lime after turning that sod over, as such soil is likely to be sour. A small quantity of fertilizer, too, in connection with the cover crop will pay, by increasing the growth of this crop, and thus giving more bulk to turn under.

HARVESTING TIMOTHY AND CLOVER.

TWO things should be held constantly in mind by the farmer when he is making his hay. First, quality, which includes palatability and nutritive value; and second, yield. There is a time to cut clover when both maximum yield and highest quality can be secured at the same time. This is in the period of early bloom, when from 50 to 75 per cent of the heads are in blossom. With Timothy this is not the case, highest quality and greatest yields do not go hand in hand. The most palatable and nutritious Timothy hay is made before, or in, the blooming stage. If cut after bloom the yield of Timothy may increase as much as one-third in dry matter. With the clover, the yield is decreased about one-third in cut after early bloom, and the quality is likewise decreased.

The Timothy plant after blooming, continues to elaborate its own food, which it manufactures, part of which is stored in the seed and in the stems and leaves, all of which are retained when harvested. The total amount of its nutritive value is also increased, as the total amount of dry matter is increased, although its nutritive ratio is decreased. In other words, the total nutrients in a smaller amount of early-cut Timothy would be as great as the total nutrients in a larger amount of the later harvested hay. The market demand, however, seems to be for a somewhat coarser, stronger hay. Such is obtained by late harvesting. This is to the farmer's advantage who ships to the city market, because he can use the earlier and better hay, so far as his needs and wants are concerned, with best results at home, and obtain best prices for the later-cut hay which the market prefers. This assumes, of course, that at least 95 per cent Timothy is harvested, and not 50 to 75 per cent Timothy and the rest daisies, dock, sorrel, etc.

The clover not only loses in yield, but also in quality when cut after the early bloom period. Both the results are due practically to the same cause, namely, the great loss of the fine stems and leaves. Of the different parts of the clover plant, the leaves contain the highest per cent of protein, the fine stems contain the next highest, and the coarse stems the least protein. Inasmuch as it is the protein content of the clover hay that makes it most valuable, the loss of the most valuable parts, before and during late harvesting, consequently decreases its quality. Furthermore, the hay is not so palatable. The stock will not eat it so readily as the earlier harvested hay. There is another consideration of a practical nature, which must not be overlooked. It is not always possible to harvest the crop at the right moment on account of unfavorable weather conditions. Over this man has no control. However, other things being equal, the Timothy and clover hay may be so harvested as to give maximum yields or highest quality, and in the case of the clover, both yield and quality.

JOHN H. REISNER.

THE PURE FOOD EXPERT.

IT comes upon us how times have changed along sanitary lines when the local paper announced a permit to sell ice. A neighbor has a famous ice pond where for many years ice has been supplied to customers. Yet before he could sell this ice in the local town it was necessary to obtain a permit from the board of health. Experts came and examined the water and the surroundings before giving consent. Then the local "council" voted on it. Up to within five years no one ever questioned the quality of this ice. Some one came along and delivered a lecture on "germs" and a craze for inspection followed. A celebrated physician told us the other day that 70 per cent. of our farmers were using milk which would not pass sanitary inspection, and water which was "dangerous." It seems wonderful sometimes that there are any healthy people left in the country, and still more so that the city is still forced to rely upon fresh supplies of country people to keep up its vigor. No one can question the right of the city people to demand pure food if they are willing to pay the cost of purifying it. This cost should not all be saddled upon the producers, and the standard of what is "pure" should not be left entirely to men with a "fad" as their only source of income.

WHERE BOYS MAKE GOOD.

A School That Manufactures Manhood.

PART II.

THE AGRICULTURAL SOCIETY.—While on these explanations I wanted to get it all, so I asked:

"What is the Lincoln Agricultural Society, to which you refer?"

"Oh, that is the merit society of the school. The 35-boys are members. They have a meeting hall in the main building, and meet there weekly. They elect officers, and appoint committees, and conduct exercises. When the roll of members is called, each boy responds with some quotation taken during the week from an agricultural paper. They have debates and general discussions on farm subjects. Each member wears a society emblem, and the cultivation of the Lincoln spirit is one of the ideals of the society."

"Just what do you boys all mean by the Lincoln spirit?" I asked a promising boy.

"It means making good; that is, doing the best one can, learning to serve others."

"Serving others is certainly a Lincoln ideal," I said, "but in what way do you do that here?" The old institutional idea occurred to me, where the attendants were supposed to serve the inmates. Here were the wards with the ideal of service in themselves.

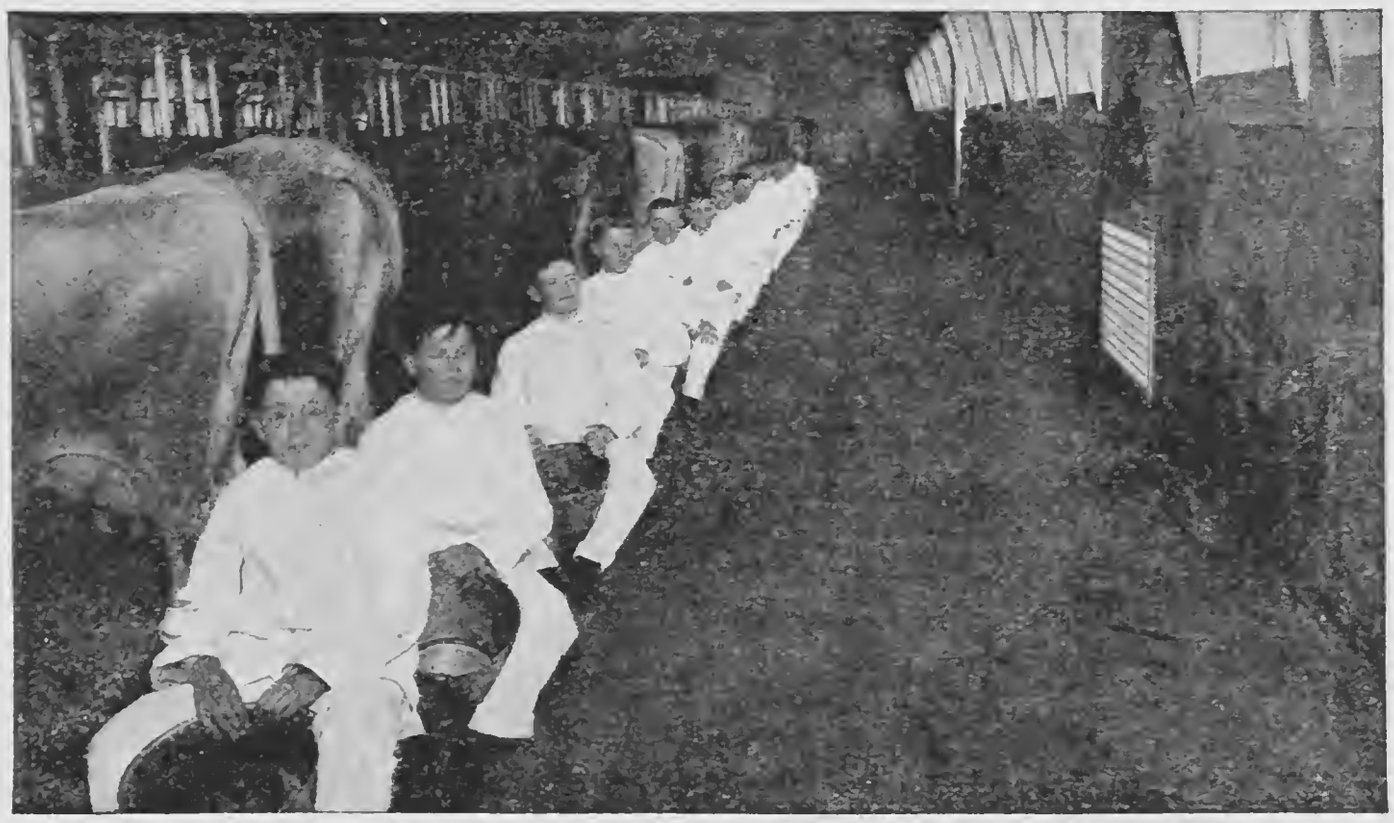
"We do it in the dairy," he replied. "We make clean milk; that is for the children. And we feed clean milk to the calves, so they will become healthy cows. When we learn to be good dairymen we can help farmers make more milk."

"That would certainly be a service. And do you hope some day to have a farm of your own and make milk?"

Three of the boys who heard the question brightened up, and two intimated that that was a possibility. Then I told them of the new Land Bank, and how a boy who worked for a time and saved his money could easily hope to own a farm, and that if he knew how to be a good dairyman he might be an important man in his neighborhood.

As we returned from the ball field I saw plots of ground lined off. In these plots the boys conducted their own gardens in spare time. No boy was obliged to keep a garden, but seed is furnished those who wanted it, and a medal is awarded to the boy who makes the most of his opportunity.

DAIRY TROUBLES.—When the Lincoln School was originally equipped some four or five years ago, it started off hopefully with a herd of Jerseys. In a short time the herd was tested and 80 per cent of them reacted, indicating a tuberculous condition. This was disheartening. Some friends of the school were disposed to give up the dairy feature, but Brother Barnabas saw his opportunity to apply the Lincoln ideal of service. He was familiar with the reports of the extent of tuberculous cows in the State and in the whole country. He knew the Bang system, and looked upon the situation as an opportunity to demonstrate how a healthy herd of dairy cattle could be built up out of a diseased herd. The Bang system is based on two demonstrated facts: First, that the pasteurized milk from cows which are in apparent good physical condition, but which react on tuberculin test, may be used without danger for human food. Second, that calves from such cows are not infected, and if separated from their mothers without any contact whatever after birth, may grow up to be perfectly healthy animals. The law in New York State provides that animals which show physical symptoms of tuberculosis must be slaughtered. If the disease has generalized—that is to say, appeared in different places—the animal must be killed and the carcass destroyed. If, however, the disease is localized—that is, appears only in one place, and so located as not to affect the flesh—the meat may be sold for food. Furthermore, the healthy-looking cows that react may be segregated from the rest of the herd, and from their own calves, the milk pasteurized and used for food. In this case the State enters into a contract with the dairyman equipped safely to do this business. By the contract the State brands the cows that react; pays for them, and retains possession of them, and reserves the right to inspect them frequently, to remove them or kill them, as conditions warrant. If killed, the proceeds for meat, if used, hide, etc., go to the State. When the State condemns a herd at a farm not equipped for the Bang system, the cows that show no physical sign of disease, but react, are sent to an equipped dairy with the view of maintaining the dairy cows of the State by raising healthy calves from these reacting cows.



MILKING TIME IN THE SANITARY STABLES AT LINCOLNDALE. FIG. 364.

YOUNG HERDSMEN WITH AYRSHIRE STOCK AT LINCOLNDALE. FIG. 365.

THE BANG SYSTEM.—Brother Barnabas at once ordered a pasteurizer, and designated the part of the farm south of the main road for the healthy cows and calves. The section north of the road was designated for the reacting cows. Mr. Myles Tierney, one of the trustees of the school, built a larger barn for the calves and healthy cows, at a cost of $5,000 as his donation to the project. To replace a barn that was destroyed by fire, a larger fireproof barn has been erected and equipped with every modern convenience for the care of cows and the production of pure, clean milk. When the calves of reacting cows are dropped in this new barn they are immediately removed to the barn on the other side of the farm, and there is no possible contact thereafter. The boys even who care for the reacting cows have nothing to do with the other cows or calves. These calves are fed on pasteurized milk. They never get raw milk. A portion of oil meal is dissolved in the milk to prevent constipation. Some of these calves have already grown into milking heifers, and have been tested, and show no reaction.

FEEDING THE CALVES.—At four o'clock the dairy boys left their game promptly for their work. At the new calf barn I first met the boys who do the work there. Pasted up in the barns I found printed rules for good dairying. One of these rules was that no calf should be fed out of a pail that was not clean enough for the boy to drink from. Every boy knew this rule by heart, and, what is more important, lived up to its teaching.

THE DAIRY WORK.—The work at the regular dairy farm would delight the heart of any man who cares for a cow. There are two wings to this barn, each wing containing four sections of 13 cows to a section. Four to five boys are assigned to each section with a 35-boy at the head of each section. From the beginning to the end each boy knew just what to do, and proceeded to do it with a vigor that was really inspiring. First the sawdust bedding was swept forward from the drop. The droppings were removed. Then a boy went over the cows with currycomb and brush. Then all traces of soil were washed from the legs, tail and flanks. The back and sides of the cow were rubbed down with a damp cloth. One boy then followed along with a pail of soft water, and gave the udder a thorough washing. Another boy followed with a second wash, and a third with still another pail of clean water gave it a third wash. Dry towels were then used all over the cow, including the udder. The brooms were then again used and all the water brushed down and out of the drop. This was sprinkled with dry shavings.

PREPARATION FOR MILKING.—The boys then repaired to the large washroom, which is provided with wash-basins and abundance of hot and cold water. After a thorough wash and a careful cleaning of the fingernails, the boys put on a white suit and cap, then came back to the wash-bowl. The faucets are arranged to turn on the water with a trip operated by the foot. The water flows, and the hands are washed as it flows. Then the patent pail and iron stool are carried without being touched, so that the first thing touched by the hand after the final wash is the cow's teat.

CARING FOR THE MILK.—As each cow is milked, her product is weighed, and one boy sits at the scale with a chart to credit the cow with the weight. Another boy does the straining. One strainer is supplied for each section. When the milking is over the strainers are inspected and the section is scored in accordance to the cleanliness of the strainer. The head boy is responsible for the section, and a new boy is required to bring his milking to him for inspection to make sure that it is clean. While the milking is going on another boy is preparing the feed, and the portions are based on the production of the cow. The boys were good milkers. I asked one how many he could milk at one milking. He said he had milked eight in an hour; but the boys seldom milk more than two or three cows each. I do not think it possible to get an equal number of men to take the pains that these boys observe to produce clean

(*Concluded on page 884.*)

Where Boys Make Good.

(*Concluded from page 883.*)

milk. I do not believe these boys will ever become careless dairymen. I asked a boy why he took all these pains to wash himself and the cows. The answer was in effect that it was not merely to be clean but to furnish clean, healthful milk for children.

AN INSPIRING INFLUENCE.—I confess that I was charmed with the enthusiasm and vigor, skill and ideals of those boys. Their conduct was edifying. Their work was inspiring. We complain of the congestion of cities and the difficulty of getting competent help at the farms. Here is a school making competent dairymen of city boys, and placing them on the farms of the State. We complain of the decrease of dairy cows. Here are boys practically trained to raise healthy dairy cows from reacting mothers. We hear complaint of unclean milk. Here is a school training boys how to produce clean milk by actually producing it, and inspiring them with the highest ideal of dairymen.

THE BOYS AND THEIR FUTURE.—When the boys are fit for service they are engaged to farmers who are willing to take them into their homes, make them members of the family, and pay them fairly for their services. The boys are placed in families of their own religious professions, the Catholic boys in Catholic families, Jewish boys with Jewish families, and Protestant boys with families of their particular denomination. Agents of the school are on the road constantly, finding places for the boys, and visiting them after they are placed. Brother Barnabas writes them a personal letter three times a year, and encourages correspondence from them.

I know no other school doing this kind of work; but there are millions of city boys who need just this kind of training. Millions of places await them on the farms, and millions of opportunities will be open for them in the future to become substantial farmers of their own lands. Hundreds of millions are now being spent by cities and States to care for boys and girls in charitable institutions without training them for any useful occupation or ideal in life. Churches of all denominations are doing their best with this difficult problem of the dependent and delinquent boy and girl; but somehow they have for the most part failed of satisfactory results. It seems to me that the Lincoln School affords a significant suggestion to the old charitable institutions. They must, however, bear in mind that a farm with suitable buildings and a dairy of cows is not enough. It will require a leader devoted to the education of boys, with a broad vision and with a heart palpitating with sympathy for humanity. All schools will not find teachers like Brother Barnabas, gifted to inspire boys with an ambition of usefulness and ideals of service to others; but he has produced a model, which men of lesser talent and zeal may follow with success. J. J. D.

Rye as a Cover Crop.

I SOWED rye after digging potatoes last year. I also sow it with buckwheat and find it dries out the land, so I must put on an extra horse to plow it under, and I am afraid it may prevent the rise of capillary water. How would wheat do to mix with buckwheat? Would it not rot easier? Would it make better pasturage for cows and swine (until it was plowed down)? When I sowed rye with buckwheat it was shoulder high early in June and I hired a man with a tractor plow to turn it under. Would you risk putting beans on that ground, or would you put in buckwheat again? I use basic slag as fertilizer. G. D. S.
Ovid, N. Y.

The wheat will make better pasture or hay than the rye, but not such a mass of growth. The wheat will also rot quicker than the rye. On our own farm with a moist season and the use of lime, the rye is rotting freely in the soil. If that rye is packed down hard and you use lime or slag we should plant beans.

Buckwheat and Sour Soil.

IN a recent issue of THE R. N.-Y. there was an article regarding the reaction of soils which certain kinds of plants require. The writer gathered from this article that buckwheat would thrive best on a soil giving an acid reaction. Am I correct in this? My experience in growing buckwheat here in California seems to indicate that it does require an acid soil. Last Summer we secured a much larger growth than we are securing this Summer. Last year the soil would give an acid reaction; the crushed limestone has begun to act, the soil now gives an alkaline reaction. Across the street from our grove is a grove over 30 years old. I know that the soil in this grove is acid to the extent of .07 of one per cent. acid expressed as calcium oxide. This man's buckwheat is making a very much better growth than we are getting. R. S. T.
Highland, Cal.

Both practice and scientific experiment show that buckwheat and rye can make a good growth on soils so acid that wheat, oats or barley would give partial failures. A small quantity of lime will sometimes help buckwheat, but heavy dressings—enough to sweeten the soil—would not pay with this crop.

Quinces for Profit.

HOW many quince trees on a farm of this size would you set, for commercial purposes, and of what varieties? Would you advise Fall planting? T. S.
Indiana.

From our own experience we would not set any. The quince is the most unprofitable fruit we have tried to raise. Unless the conditions of soil and climate are exactly suited to it the trees will bloom freely but set little or no fruit. There is a limited demand for quince. We would not plant over 100 trees if we knew they would thrive.

LEGAL QUESTIONS.

Distribution of Estate.

1. If a husband dies leaving no will, will all his property (real estate and personal) go to his wife, provided there are no children? 2. How much would fall to the wife if there were children, and no will? R. C. R.
New York.

1. Where there is no will, real and personal property are not distributed in the same manner nor proportion. Whether there are children or not makes no difference with the real estate. The wife's only interest in that would be her one-third dower interest for her life, and if there were no children, the balance would go to the husband's father, mother or brothers and sisters, according to which side of the house the property came from and which were living at his death. The personal property, if there were no children, would go, one-half to the widow, and the other half to the next-of-kin, that is, to the parents, brothers and sisters, etc.

2. If there were children, the wife's interest in the real property would be the same, that is, she would have her dower interest and the balance would go to the children. One third of the personal property would go to the widow and the balance in equal portions to the children. M. D.

Rights in Exchanged Property.

About 20 years ago my father bought a piece of property specified as a quarter of an acre more or less. The deed gives the usual boundary lines, but does not give the number of feet bounding on any of the properties or on the street. My father made a verbal agreement with one of the adjoining property holders giving him four feet in the road for two feet in front. A wall of stone was built on the line agreed to. This wall has stood for nearly 20 years. Last year our neighbor built a house on his property and the wall was torn down with our consent. Now he wants to claim the two feet he traded and holds as the agreement has not been recorded in writing he has a right to this two feet still. T. N.
Connecticut.

The boundary between your neighbor and yourself seems to have been definitely settled by the location of the boundary by your father and his neighbor, and you and your neighbor are bound by it now, especially so if he has acquieseed in the present boundary and keeps the four feet in rear. It would have been better, of course, if your father had had a complete survey of the land made after the exchange and then the neighbor had signed a deed containing the two-foot strip to your father and he in turn had signed one to the neighbor containing the four-foot strip so that there could be no dispute over the line. The boundaries should remain as settled, and your neighbor would not be entitled to change them now unless there are other equities intervening which you do not name.

Renewal of Demand Note.

Will you please tell me if, under the laws of Connecticut, a note like the following has to be renewed and how often? It reads: "For value received I promise to pay on demand $500 without interest." It is signed and dated. In this case a son lays out money on his mother's place. As there are other brothers and sisters he was given this note to secure himself, but he asked no interest, and does not expect to ask for the money during his mother's lifetime. E. W. H.
Connecticut.

The demand note which you set out does not have to be renewed, but is a binding obligation, and may be collected from the mother's estate.

E. Frank Coe Fertilizers

1857 THE BUSINESS FARMERS' STANDARD FOR OVER FIFTY-FIVE YEARS 1914

YOUR CROPS Are 100% Important to You!

Will It Pay You to Observe and to Study Them?

THE first essential toward improving your crops is to understand them. To understand them it is necessary to study and to observe them in their true present condition. Remember that there are those who have eyes to see—but see not. To encourage home study and observation and improvement of farm crops, we offer the following prizes:

A—FOR BEST PHOTOGRAPH OF CORN—
First Prize—$20.00 in Cash
Second Prize—$10.00 in Cash
Third Prize—$5.00 in Cash
Five Gratuities of $1.00 each

B—FOR BEST PHOTOGRAPH OF POTATOES—
First Prize—$20.00 in Cash
Second Prize—$10.00 in Cash
Third Prize—$5.00 in Cash
Five Gratuities of $1.00 each

C—FOR BEST PHOTOGRAPH OF HAY—
First Prize—$20.00 in Cash
Second Prize—$10.00 in Cash
Third Prize—$5.00 in Cash
Five Gratuities of $1.00 each

D—FOR BEST PHOTOGRAPH OF WHEAT OR OTHER GRAINS—
First Prize—$20.00 in Cash
Second Prize—$10.00 in Cash
Third Prize $5.00 in Cash
Five Gratuities of $1.00 each

Photographs not receiving a prize or gratuity will either be returned or purchased by us at a price to be agreed upon. In the event of a tie between two or more pictures the prize will be equally divided. ¶ There is no red tape connected with this competition. The only stipulation that we make is that the crop photographed shall be raised with **E. Frank Coe Fertilizers.** The greatest freedom will be allowed in regard to choice of subjects. Crops may be shown growing in the field, while being harvested, or after harvesting.

The competition will close on OCTOBER 15, 1914, and all photographs should be in our hands not later than that date. ¶The prize-winning pictures will be published in the leading farm journals during the winter of 1914-1915, thus putting the results before a multitude of farmers.

JUDGING THE PHOTOGRAPHS

The photographs will not be judged by The Coe-Mortimer Company nor by any of its representatives. ¶The judging will be done solely by the following disinterested committee:—

Mr. William F. Dillon, Secretary of the "Rural New-Yorker," a farm paper that always stands for a square deal.

Mr. H. H. Charles, President of the Charles Advertising Service, the largest organization in the country handling agricultural advertising exclusively.

Mr. Arthur Stewart, President of the Stewart Publishing Company and Treasurer of the Van Dyke Gravure Company, prominent art publishers of New York City.

In awarding the prizes the Committee will use only this scale of points:—
General Excellence of Crop as Illustrated - - 60 points.
Artistic Merits of the Picture - - - - 40 points.

Write to us for full details of the contest today

THE COE-MORTIMER COMPANY, 51 Chambers St., New York City

Plant LOVETT'S Pot-Grown Strawberries

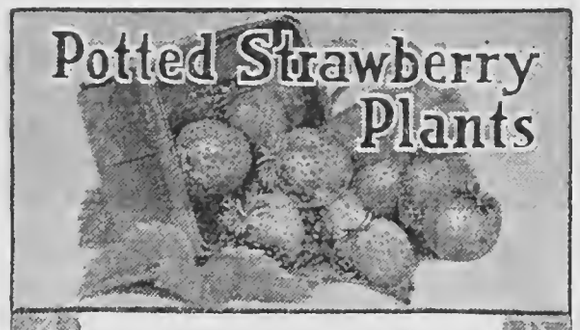
this Summer and have an abundance of big, red, luscious berries next June

I am a pioneer in growing Pot-Grown Strawberries. I have been growing them for 36 years. I offer properly grown plants of all the choice new and good old varieties—but by far the finest of all strawberries are the Van Fleet Hybrids, the

Early Jersey Giant, Edmund Wilson & Late Jersey Giant

now being introduced by me. They yield enormously, have the delicious flavor of the wild strawberry, and are as large as small apples. These three varieties give a long season of fruit, from the earliest until the very latest. Write for my booklet, mailed free. It tells all about the Van Fleet Hybrids, illustrates and describes a score or more of other fine varieties (including the best of the Everbearing Strawberries), and gives *full cultural instructions.*

J. T. LOVETT Box 162 LITTLE SILVER, N. J.



The best varieties, both new and old, and the best methods of planting to raise a full crop of Strawberries next year, are fully particularized in

DREER'S Mid-Summer Catalogue

Also the best varieties of Celery, Cabbage Plants, etc.

A most complete list of the *Best Hardy Perennial Seeds* for summer sowing.

Also vegetable and farm seeds for summer and fall sowing. Select list of seasonable decorative and flowering plants.

Write for a copy and kindly mention this weekly—FREE.

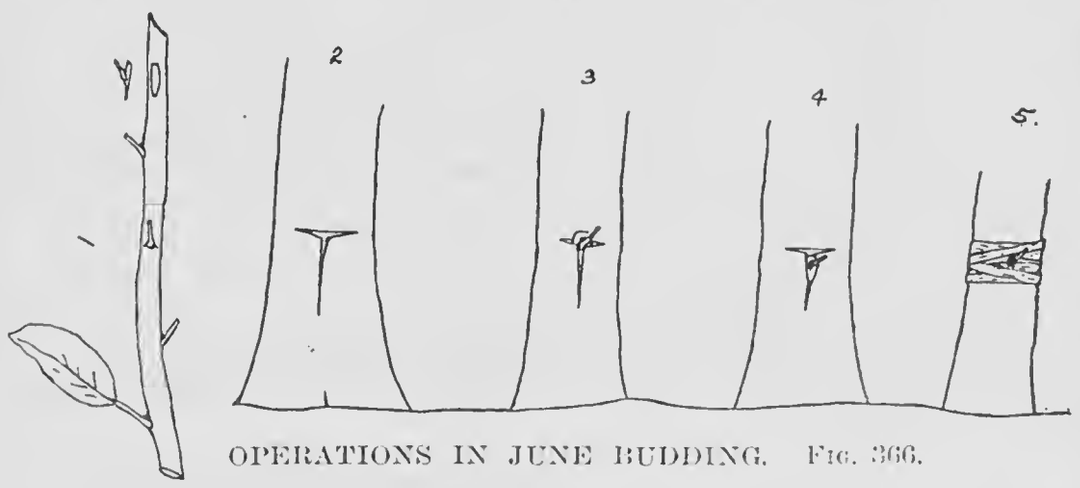
JUNE BUDDING.

PLEASE tell me how is June budding done on peach trees? Can it be done on apples? J. D. C.
Jewett, O.

June budding is adapted to both peach and apple trees. There are many factors to be considered if success is expected. The operation of budding is not a complicated one, though it requires patience and care. The bud is taken from a well-developed shoot of the current year's growth, as shown at Fig. 366. The bud is cut from the twig with a sharp knife. The cut should start about three-eighths of an inch below the bud, and pass under the bud deep enough to remove a small chip of the wood. Another cut is made across the twig above the bud, which removes the bud from the twig. Some propagators remove the chip of wood from the under part of the bud. Cherry buds will do better if this chip is not removed. After the bud is ready a T-shaped cut is made in the bark of the stock as near to the ground as convenient. This cut should be opened as at 3, Fig. 366. A regular budding knife has a thin handle for this purpose. The bud



OPERATIONS IN JUNE BUDDING. FIG. 366.

is then inserted as shown at 4, Fig. 366. About one-half inch of the stem of the leaf should be left on the bud to facilitate handling. When the bud is pulled down as shown at 4, it is ready for tying. This is done with raffia. About three turns are given above and below the bud so as to cover the cut, leaving only the bud exposed.

Do not leave the raffia on the tree after growth commences in the bud, or the bud may be killed. When the bud has advanced far enough to have leaves of its own, part of the stock should be removed. All the top should not be removed at one time as it would be too severe a check on the growth of the bud. Seed is usually planted in the Spring, and budding commences about the last of June. Care should be taken not to let the bud or cut on the stock become dry. Young trees may be top-worked by budding though the work must be done on the younger shoots. The buds should be taken from the best trees of the variety one desires to propagate, as the bud will perpetuate the character of the tree it is taken from. The best is none too good.

R. B. G.

RAISING SNAPPING TURTLES.

COULD you give me any information about the care and feeding of snapping and mud turtles? H. P. F.
Stamford, Conn.

Wild snapping turtles are probably almost entirely flesh eaters and are not at all particular to have their meat fresh. If they can catch fish, frogs, young ducks or any other water animals they eat them, and they can be found near any dead animal in the water. Old farmers in this region say their flavor is much improved if they are kept in the swill barrel for a few weeks before being killed. With the possible exception of a few terrapin growers the raising of turtles in this country is apparently confined to the experimental terrapin farm of the U. S. Bureau of Fisheries at Beaufort, N. C. There is a turtle farm in Japan which has been in successful operation since 1875. These two farms furnish the most reliable data we have on the care and feeding of turtles.

The food given turtles which are being grown commercially should be mainly meat of some kind; fish if that is available and cheap; liver and clean meat scrap can be given at times; and when no other is available they may be kept for a time on a cooked mash of cornmeal or wheat fed alone or mixed with meat. The feeding should be done always in the same place, to make it easier to clean up occasionally the refuse that is left.

There should be at least four pens in a commercial turtle farm: (1) a breeding pen with a large sand bed that is always above water where the eggs can be laid. Provision must be made to keep the young from getting into the water in this pen as they would be promptly eaten up by the old ones. (2) A pen for the young from the time of hatching until they become active the next Spring. (3) A pen for the young during the next year. (4) A pen for the turtles from the second Spring until they are sold or put into the breeding pen. These pens should have water two or three feet deep over most of the area, but should have some dry land where the turtles can crawl out to sun themselves. They should be so fenced as to keep in the turtles and keep out vermin. A suitable fence can be made of concrete or boards. It should be two feet or more high, with a cap of dressed lumber or sheet metal to keep the turtles in, and should extend two feet or more into the ground. It should be possible to draw off the water when it is necessary to clean the ponds. There should be a good layer of soft mud in the bottom and it will be well to encourage the growth of water plants in the pond and along the shores. In the Japanese turtle farm it has been found profitable to keep fish in the ponds to keep the water stirred up and muddy. Carp, eels and bullheads (horned pouts) would be suitable for this.

The enemies the young turtle has to fear are rats, skunks, larger turtles, muskrats, snakes, herons and kingfishers. Rats and skunks will dig up the nests and eat the eggs. Larger turtles will eat the young when they can catch them. Muskrats cause the most damage by making holes in the embankments and letting the turtles out or into ponds with larger ones. Snakes will eat the young when they can get them and herons and kingfishers are under suspicion. After the young get three or four inches long (length of upper shell) they have practically no enemies except man.

ALFRED C. WEED.
Wayne County, N. Y.

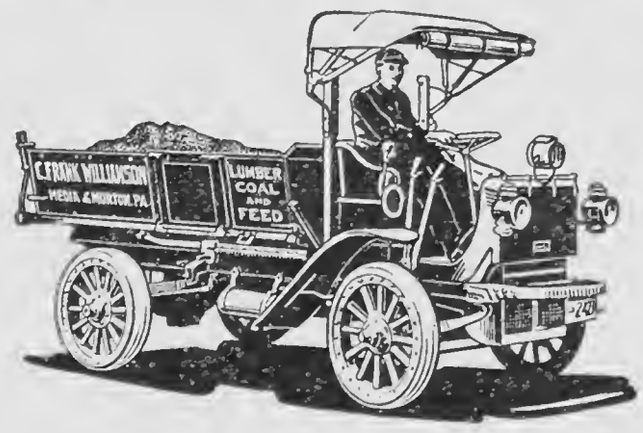
SHORT STORIES.

POISON IVY AGAIN.—The lime-sulphur application for poison ivy trouble is an easy and most likely a handy remedy for that poisoning. For those who do not spray or use lime-sulphur I would say dissolve a rounding teaspoonful of permanganate of potash crystals in a quart of water and apply. I wish anyone trying this would report results. It has cured two members of our household in 20 minutes on different occasions. E. H. A.
Connecticut.

CITY WORKERS.—Regarding positions on farms for students without practical knowledge of farming, the experience of farmers in this section with help of that kind has been most unsatisfactory. While we may enjoy association with these men, at best they are very expensive help, because they do not know the fundamentals of farm work. Each small detail has to be personally overseen. One drawback is that our busiest seasons are the early Spring and late Fall, when they cannot be with us. Of course there are exceptions, but for us the average man without any farm experience is worth little more than his board. ROY P. MCPHERSON.
Genoa Co., N. Y.

UNEVEN GROWTH OF OATS.—On page 618 C. W. B. writes that the oats on the northern incline of a field rusted, while the oats on the southern side did not. The oats on the northern slope, or incline, received the sun's rays more directly, and the dew became, before evaporation, hotter than on the southern slope; therefore the northern slope was more favorable to rust. The sun did it. B.

THIS AUTOCAR BUILT FOR FARM NEEDS



Two Ton Combination Feed, Lumber and Dump Car fills long felt want for general utility vehicle

THE new "general utility" ***Autocar,*** with dumping body, has met with quick response from farmers, contractors, flour and feed merchants, coal dealers and other concerns in city and country. Its ability to cover wide territory, its adaptability for average country roads and its simplicity of operation make it of extraordinary value for a variety of hauling purposes on the farm.

The Autocar

"Used in Every Line of Business"

C. Frank Williamson, of Media, Pa., dealer in lumber, coal and feed, uses his ***Autocar*** to advantage for quick deliveries and finds it a surprising business builder. Recently he hauled 80 tons of crushed stone from two 40-ton freight cars on a Media siding to the grounds of the Rose Tree Hunt Club, a mile and a half away. The distance was not great, but the fact that the ***Autocar completed this work in two days*** shows its possibilities for quick hauling. It would have taken six horses to have finished the work in that space of time.

In the above illustration of the combination coal, feed, lumber, and dump car, the side stakes used in hauling lumber are not shown. The car is furnished with side and tail gate.

The Autocar's well known economy of fuel and its freedom from repair expenses make it unquestionably cheaper to buy and operate than its equivalent in horse equipment. This has been the experience of farmers and hundreds of concerns in every line of business.

Lowest Prices Ever Made On World's Best Roofing

Corrugated

Edwards Patent "Grip Lock"

Brick Siding

Ceiling

Lightning-proof, Fire-proof, Rust-proof, Rot-proof, Galvanized Steel Roofing Lasts as Long as Building Stands
Once you have purchased and laid Edwards Tightcote Galvanized Steel Roofing your roofing expense for that building is at an end. Its cost per square is the lowest ever made. It has *no* up-keep cost. Always beautiful in appearance. Reducing cost of fire insurance.

EDWARDS Exclusive Tightcote Process
Makes Rust-Proof Roofing. The zinc spelter becomes practically one piece with the steel. No ordinary galvanizing can compare with it. Each and every *Edwards Metal Shingle, Metal Spanish Tile,* each sheet of *Edwards Reo Steel Shingles, Grip Lock Roofing, Pressed Standing Seam* or *Roll Roofing, Ceiling, Siding, etc.,* is dipped in a *bath of molten zinc, one at a time after the metal has been stamped and resquared. The edges are galvanized* as heavily as the sides. Not the space of a pin-point on the steel is exposed to the weather.

How To Test Galvanizing Take a piece of any other galvanized steel, bend it back and forth several times, hammering it down each time. You will then be able to flake off great scales of the galvanizing with your finger nail. Apply this test to a piece of *Edwards Tightcote Galvanized Steel Roofing*—you'll find no flaking—not a space on the metal the size of a pin point exposed to rust.

EDWARDS Patent Interlocking Device
Prevents Warping, Buckling or Breaking, Protects Nail Holes—They Can't Leak or Rust. Takes care of expansion and contraction, EDWARDS Roof never warps, buckles or breaks—nails are driven through the *under* layer not exposed to weather—cannot rust. No special tools or experience needed to lay EDWARDS Galvanized Steel Roofing; anyone can do the work—lay over old shingles if you wish.

Reo Steel Shingles *Cost Less, Outwear 3 Ordinary Roofs* and are your joy and pride forever. No matter what kind of a building you have in mind there is a style of EDWARDS *Galvanized Roofing* exactly suited to your needs.

EVENTS OF THE WEEK.

DOMESTIC.—An explosion of gas in the mine of the Hill Crest Colliery, Alberta, June 19, resulted in the death of 195 of the 225 men who were entombed. Twenty men were taken out alive. The explosion tore roofs off houses and wrecked buildings in the vicinity. The entrance of the mine was choked with debris. Thousands of tons of rocks crashed into the workings. The scene of the disaster is only a mile from Frank, Alberta, where a great disaster occurred ten years ago. The mines have been operated at intervals for twelve years, and at times there was considerable difficulty in getting men to work there. The main tunnel opens on the crest of the mountain and an incline railway takes the output to a railway track a mile away. The Hill Crest mines are under the same mountain as the Frank mines. The town of Hill Crest has a population of 600. This is the third great disaster which has fallen to the inhabitants of Crows Nest Pass. Four years ago thirty-five men were killed in the Bellevue mine by gas and ten years ago Frank was wiped out by a mountain slide, 125 persons being buried alive.

Inquiry into the Empress of Ireland wreck at Quebec continues to call out much conflicting testimony. The first officer of the collier admitted, June 17, that he had not obeyed instructions in failing to call his captain from below when the fog shut down just before the collision. He said he believed the Storstad had the right of way and that he was entitled to keep his course at reduced speed, even though he had signalled previously to the Empress that he had stopped. He blamed the current for swinging the ship, and said she had not sufficient headway to give quick response to her helm.

William Lorimer and Charles B. Munday are charged with looting the La Salle Trust and Savings Bank of Chicago of from $2,000,000 to $2,700,000, in the report filed June 17 by Bank Examiner Harkin with State Auditor Brady. Criminal prosecution of both was decided upon following a conference between Mr. Harkin and Attorney-General P. J. Lucey. It is the intention of the Attorney-General to base criminal action upon a general charge of conspiracy to loot the bank. Following is a list of some of the transactions which were called to the attention of the Attorney-General by Bank Examiner Harkin in his report: A $120,000 loan to William Lorimer & Co. on a note secured by Southern Traction Company bonds. A $100,000 loan to J. P. Gallagher, William Lorimer's partner in the firm of Lorimer & Gallagher, on a note secured by the same bonds. A $160,000 loan to the Southern Traction Company, in which William Lorimer was interested, on its unsecured notes. A purchase of $350,000 of the bonds of the same company. A $180,000 loan to Lorimer & Gallagher on the notes of the firm. A $203,000 purchase of the bonds of the Illinois and Louisiana Land Company, of which ex-Gov. J. Y. Sanders of Louisiana is the head.

June 18 the smoke and ashes from the eighth eruption of Mount Lassen since it became active May 30 were plainly visible from Redding, Cal. The eruption was a heavy one, the smoke showing plainly, although a thick haze prevented a view of the mountain, 50 miles away. There are two active craters now, the original vent near the summit and a smaller blow hole on the south slope.

Twelve persons, most of them women and children, were drowned in the Oswego Canal, just south of Mud Lock, Onondaga Lake, N. Y., June 21, when a passenger launch plying between Mud Lock and Liverpool struck a stump and capsized.

Violence broke out anew, June 23, in the struggle between factions of the Butte, Mont., miners' union; three men were shot, one being killed, by deputy sheriffs in clearing Miners' Hall. Attempts were made to dynamite Miners' Hall, but the charges failed to do any great damage. The explosions could be heard for blocks. Armed men went to the Stewart mine and carried down boxes of dynamite in their efforts to blow up the hall, but the guns of deputies prevented effective placing of the charges.

ADMINISTRATION.—The Senate has ordered a "thorough and complete" investigation into the use of Senate committees' stationery in the exploitation of the North Carolina gold mine promoted by Walter George Newman and into the sending of an employee of the United States Treasury to investigate the mine. The resolution was amended before its adoption, June 19, to provide that the investigation should be conducted by the Senate Committee on Privileges and Elections, of which Senator Kern is chairman, instead of by a special committee of five Senators. The resolution authorized the committee, acting as a body or through a sub-committee, to conduct the investigation.

A substitute for the La Follette seaman's bill, passed by the Senate some months ago, was reported to the House, June 19, by the Committee on Merchant Marine and Fisheries, of which Representative Alexander of Missouri is chairman. The bill is designed primarily to promote the safety of life and property at sea and to promote the welfare of American seamen. It provides for the use of a larger number of life craft on passenger vessels and reduces the hours of work of seamen. What are regarded as harsh measures in the treatment of seamen are prohibited. In an effort to improve the condition of seamen the bill provides that in all merchant vessels of the United States of more than 100 tons gross the sailors while at sea shall be divided into at least two watches, and the firemen, oilers and water tenders into at least three watches. The only exceptions made in the application of this rule are in the cases of vessels navigating rivers, harbors, bays or sounds exclusively and vessels whose routes between terminal ports do not exceed a run of thirteen hours.

COMING FARMERS' MEETINGS.

Summer meeting, Virginia State Horticultural Society, Charlottesville, Va., July 15.

Summer meeting, New Jersey State Horticultural Society, farm of J. H. Barclay, Cranbury, N. J., July 15.

Annual Show of the Paterson, N. J., Poultry, Pigeon and Pet Stock Association, November 18-21.

Indiana Apple Show, Tomlinson Hall, Indianapolis, Ind., November 18-24.

BUFFALO MARKETS.

The city markets begin to overflow with all sorts of home-grown produce, though the fruits, such as peaches, apricots, plums and cherries are still mostly from warmer parts of the country. Strawberries are becoming very plenty and the quality better than usual.

Beyond the slight decline in green stuff generally there is not much change in prices of late. Apples, the fruit that competes most directly with the Southern fruits, are still fairly plenty. Prices are declining, the range being $3 to $4.50, with Western apples $1 to $2 a box. They retail at 1 to 2 cents apiece in small measures, which is very low. Watermelons sell at 20 to 50 cents apiece by the hundred and muskmelons at $1.75 to $3.25 per crate. Potatoes are becoming scarce. They have been quoted for a long time at not over 85 cents a bushel wholesale, but are now not less than a dollar for good quality. The consumer is eager for new ones, but finds them selling at $4.50 a barrel for Southern, and close to $2 a bushel at retail. New Bermudas are plenty, selling at 50 cents a peck, retail. The local potato crop is promising, but will be very late, as the conditions early in the season were against either planting or growth. Butter, cheese and eggs are steady, with prices little changed. Butter is not quoted at more than 29 cents, and the markets are selling good grades at 28 cents. The sale of margarine is encouraged by the dealers in a way that gives the supposition that it nets them more than butter does. Chicago brands retail at 22 cents a pound. New cheese sells at 15 cents for best grades to the trade, and retails for 18 cents. Eggs are stronger in the higher grades. The wholesale price ranges from 20 to 24 cents; duck eggs, 28 cents retail. The vegetable list lengthens steadily, everything being at moderate prices, except cabbage, which is $1 to $1.50 per crate. Peas vary much in quality. Telephones being $2.25 per bag and low grades $1. Asparagus is plenty at 10 cents a small bunch, or $1.25 to $1.50 per basket wholesale. String beans are $1.25 to $1.75 per hamper, or at retail 10 cents a quart. New beets are 5 cents a bunch or 50 cents a dozen. Celery is about out of market, some Kalamazoo being offered at 20 to 65 cents a box. The dry, hot weather advanced the price of hay, which is now strong at $16 for No. 1 Timothy.

J. W. C.

CUTTING AND CURING WHEAT.

The Department of Agriculture makes the following statements about wheat harvesting:

"Wheat may be cut with safety when the straw has lost nearly all of its green color and the grains are not entirely hardened. If cut sooner than this, shriveled kernels will result; if left standing until fully ripe, a bleached appearance, due to the action of the elements, often results and loss from shattering may follow. Wheat that is fully ripe is also more difficult to handle.

"Wheat should be shocked in the field immediately after being cut and bound. A shock is begun by standing two bundles in a nearly upright position with heads together and butts sufficiently apart to prevent falling over. From 8 to 12, and sometimes more, bundles are then set up about these until a round shock of the proper size is formed. The number of bundles to place in a shock depends upon the degree of ripeness, the length of straw and the size of the bundle, fewer bundles being used where the straw is short or not fully ripe. In placing the bundles the butts should be jammed into the stubble to insure firmness, and the heads should lean inward sufficiently to prevent falling over. When this part of the shock is completed it should be covered as perfectly as possible with two bundles, the heads of which have been broken down at the band, to form a cap. This cap should be placed so as to protect the standing bundles from rain and sun as much as possible. If the heads of the cap are placed on the side of the shock toward the prevailing winds some protection against blowing off may be afforded.

"Stacking is particularly important when thrashing cannot be done soon after the cutting, because it affords better protection for the grain at once. When the wheat is in the stack a process called 'sweating' takes place which improves the color, condition, and test weight of the grain. It also improves its milling and baking qualities. A similar 'sweating' process may apparently take place in shock-thrashed wheat after it is placed in the bin."

Enlarged Liver.

One in a while I find one of my fowls dead with enlarged liver. What is the trouble? I feed wheat in the morning, corn at night, they are out all day in a large run. J. F. N.

New York.

Enlargement of the liver is not a disease in itself but rather a symptom of one of several diseases from which fowls suffer. It may be enlarged from congestion as the result of irritating or poisonous food, from the presence of parasites, the result of certain infectious diseases, particularly cholera, or from obstruction to the circulation in diseases of the heart. It is also found enlarged in fowls that are over fat as a result of having been heavily fed and closely confined. M. B. D.

POISONING PIGEONS.—On page 590 you advise poisoning pigeons. This is cruelty to pigeons, dangerous to other birds and poultry, a menace to some one's pet cat which might find a poison victim, and a waste of good food. Feed the pigeons regularly on the ground for a few days, prop up a large box or sieve with a stick over the feed for two or three days, then tie a long string to the stick and pull when the pigeons are under it. You can then transform a nuisance into a pot-pie.

This Summer's Cover Crops

Will be far better and heavier if you give them plenty of Nitrogen, the food they must have. The best way, the modern way, to put Nitrogen into the soil is with

Ferguson's NITROGEN BACTERIA

Used to inoculate the seeds for legumes—Alfalfa, Clover, Vetch, Peas, Beans, etc.—these little living Nitrate factories gather Nitrogen from the air and store it on the roots of the plants, storing so much that not all can be used and part is left to enrich the soil for future crops. The same bottle of Ferguson's contains all the varieties of Bacteria necessary for the inoculation of any legume.

Costs only a fraction as much as the best commercial fertilizer

Quarter-acre quantity, 50c; 1 acre, $2; 5 acres, $9. Let us explain why you need Nitrogen Bacteria and why Ferguson's is best. Write for special booklet N—free.

HOMEWOOD NITROGEN CO., 51 Liberty Street, New York City

We want agents—a very liberal offer

Wrought Iron Pipe—of sound, second-hand quality, with new threads and couplings, 14-foot lengths and up. Also pipe cut to sketch for fences, or drilled for irrigation purposes. We guarantee entire satisfaction or return money. PFAFF & KENDALL, 101 Foundry St., Newark, N. J.

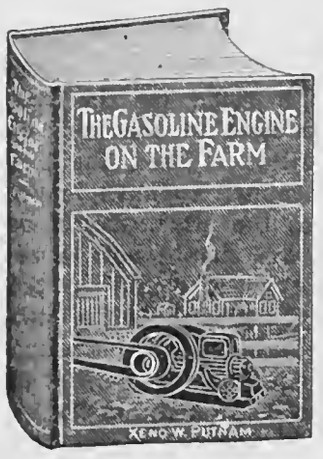
GASOLINE ENGINES

Don't buy any of the above till you get our Catalog and reasonable prices. We'll surprise you. Hundreds testify to the wisdom of this counsel. Send for new 1914 Catalog full of pictures. A. W. GRAY'S SONS, 14 South Street, Middletown Springs, Vt.

THE GASOLINE ENGINE ON THE FARM. Its operation, repair and uses. By Xeno W. Putnam.



This is the kind of a book every farmer will appreciate and every farm home ought to have. Includes selecting the most suitable engine for farm work, its most convenient and efficient installation, with chapters on troubles, their remedies, and how to avoid them. The care and management of the farm tractor in plowing, harrowing, harvesting and road grading are fully covered; also plain directions are given for handling the tractor on the road. 530 pages. Nearly 180 engravings.

This book will be sent to any address prepaid for
TWO NEW YEARLY SUBSCRIPTIONS

GASOLINE ENGINES

HOME MADE ACETYLENE
Safest Light and Cooking Fuel
Insurance records prove it

Insurance records show this—the misuse and abuse of city gas, kerosene and gasoline caused over 100,000 fires in six months. While the misuse and abuse of acetylene caused but four fires during the same period. And there are over a quarter of a million COUNTRY-HOME-ACETYLENE-PLANTS in use. A mighty fine showing for acetylene.

A hundred feet of acetylene makes more light than a thousand feet of city gas. For this reason acetylene light burners have small openings — so small that not enough gas could escape from an open burner — in a whole day — to do any harm whatever.

Also, acetylene gas is not poisonous to breathe — you would suffer no harm in sleeping under an open unlighted burner. Also, acetylene burns with no odor whatever — but acetylene from an unlighted burner has a strong pungent odor which immediately attracts attention.

Also, acetylene lights are permanently fastened to walls and ceilings — they cannot be tipped over.

Also, the acetylene producing stone, UNION CARBIDE, won't burn and can't explode.

For these reasons insurance authorities have pronounced acetylene safer than illuminants it is displacing.

Our advertising literature tells all about the best way to make acetylene for country home use, and how it is used extensively for cooking as well as lighting. Just address—

RAINFALL AND THE SOD MULCH.

MY attention has been called by Prof. K. C. Livermore of the State College of Agriculture to the fact that in the recent bulletin from this Station on tillage and sod mulch in the Hitchings orchard there is no comparison of the rainfall in the Hitchings orchard, where the sod mulch method is successfully used, and in the apple counties farther west where the sod mulch method is a failure. Readers of the bulletin on the Hitchings orchard will call to mind that the chief cause assigned for the success of the sod mulch method is, the greater quantity of moisture available to the Hitchings trees from the deep soil acting as a reservoir and from seepage from nearby hills. It was not feasible in carrying on experimental work in this orchard to take rain records and, therefore, there was no discussion of the rainfall in the orchard.

Now Prof. Livermore comes with the statement that "The rainfall in the section about Mr. Hitchings' orchard is ordinarily 25 or 35 per cent. greater during the growing season than in Western New York." Asked for proofs, Prof. Livermore submitted a map showing the normal annual precipitation of New York as computed by the Weather Bureau of the United States Department of Agriculture. A study of this map shows that the rainfall in the part of Onondaga County in which the Hitchings orchard is located is about 10 inches, or 25 per cent. greater than an average for the five great apple counties of Western New York. Prof. Livermore has calculated the rainfall for May, June, July, August and September in the Hitchings locality and his calculations, taken from data in six different points in Onondaga County, show that there is about 25 per cent. greater rainfall during the growing season in Onondaga County than in Ontario, Wayne, Monroe, Orleans and Niagara—the apple counties of New York.

The writer is anxious to add this evidence to that submitted in his bulletin on the Hitchings orchard to show that moisture is the most important factor in influencing the results in sod-mulched orchards. This greater Summer and seasonal rainfall in the Hitchings orchard means that the trees in sod have a much better chance than those in orchards to the west, where the rainfall is a quarter less. It is evident that in Onondaga County apples can be grown in sod as in England and in localities along our Atlantic seaboard where the rainfall is heavy, much better than they can be grown under the same conditions in Western New York, in the Mississippi Valley or on the Pacific Coast, where the fall of rain is not so great.

Since Prof. Livermore has called my attention to this matter I have taken opportunity to study the maps and records showing the rainfall of New York, and am much surprised to find how greatly these records vary not only in different parts of the State but even within the limits of a single county. I am somewhat surprised to find that the apple belt of Western New York, both for the whole season and for the growing months, has the lowest rainfall of any section in the State. I am sure that fruit growers and farmers will be well repaid by a close study of the rainfall records of the State. These, if I am rightly informed, can be had by applying to Prof. W. M. Wilson of the State College of Agriculture at Ithaca. Beyond doubt, a careful study of other weather records would prove quite as profitable as those of the rainfall. There is no question but that differences in rainfall and temperatures should be given much more consideration than they now receive in dealing with all such farm problems as tillage, fertilizing, spraying and seeding, in selecting crops and in adopting farm practices to local conditions.

In closing, attention must be called however, to the fact that rain is not an unmixed blessing, as we who have suffered so much from drought rather universally think it to be. Unfortunately, wet Summers and wet localities in New York are almost invariably not only moist but cold as well, while dry Summers and dry localities are as a rule excessively warm. The condition most desirable is half way between the two extremes, and Summers of normal rainfall and localities where seasonable rainfall is the rule are those in the long run most to be desired. U. P. HEDRICK.

Geneva, N. Y. Agri. Station.

Mullein Foliage for Sale.

CAN you tell me where mullein foliage can be sold, and the price per pound, also how to prepare it for market? We have any amount of it, and it is about 18 inches high. F. E. B.

Pennsylvania.

There is a rather limited demand for mullein flowers and leaves by the large drug houses and concerns making a specialty of botanic drugs. The price is variable. The flowers sometimes bring 75 cents per pound and the leaves very much less, depending on how much they are wanted. It should be dried carefully in the shade, and packed in clean bags, free from stalks or trash of any kind.

CROP REPORTS.

THE drought is hitting us hard in Western New York, especially in hay. We shall not harvest 20 tons from 30 acres. Clover is ready now—six inches high! Those who sowed oats and peas for the canning factory will also suffer heavily. I am glad we cut out both crops this year. It was good judgment. We got our bean ground plowed early and now have 24 acres in fine shape—all the early moisture has been saved for use by good cultivation and preparation of seed bed. Peach trees are recovering from leaf-curl now. The apple set is not good, but will give a fair crop, as the blossom was exceptionally heavy. Pears are scarce and plums about average. I have a 20-acre wheat field which promises 30 bushels an acre.

Monroe Co., N. Y. M. C. B.

June 16. Corn on the ear is worth $1 a hundred; wheat $1.05; oats 50; potatoes from 90 to $1 a bushel. Butter 30 to 35; eggs 20. At this writing very little fruit and vegetables for sale. Many of our farmers are engaged in the dairy business, and are now receiving 2½ cents per quart. Very few cows or beef cattle for sale. H. M. B.

Hampton, N. J.

June 19. Everything here is late; hay crops on most fields very light, grain coming well, the chief grain raised here is oats, but some wheat, and barley; field crops all in good shape. The season started cold, frost as late as June 6, and dry; lately plenty of rain, but cool nights. The Brown-tail moth is not very bad here this year, but the tent caterpillars are everywhere. The Gypsy moth has not made much of an appearance around in this section as yet. Green horses, not first class, sell for from $200 to $275 in the Rockland market. Cows, new milch, sell from $60 to $90; four-weeks-old pigs $4 to $5. Pork $7 to $10.50 per cwt. Cornmeal and most mill feeds $1.60 per cwt.; oats 54 cents per bushel. Eggs 25; butter 26 to 29.

South Thomaston, Me. J. C. S.

June 16. These are local prices only; nothing is shipped out so far to amount to much except sweet potatoes. Beef cattle are sold to local butchers at from $15 to $25 per head (native stock, generally poor.) Milk retail 10 cents a quart, 30 to 35 per gallon. Butter 35; eggs now 20, Winter 30 to 40. Potatoes, Irish $1. Sweet $1.25 now—later 60 to 75. All sorts of gardening products generally sold by the local dealers for growers, getting 10% commission for trouble.

This is a Summer and Winter resort, and a good deal of truck is raised around here to supply the local demand. In a few years the pecan and Satsuma orange plantings will overshadow everything else. Land has risen in value from 50 cents to $1 per acre to $15 to $40 per acre according to location (cut over wild land), and near the coast is partly well sold out, no more to be had unless back from coast 10 miles or more.

The local truck grower realizes his 90 cents on the dollar right enough, though in the trucking centers—Long Branch, Miss., St. Elmo, Irvington, Grand Bay, etc., all in Alabama, the tale would read differently, as all of their truck goes North. Satsuma oranges and grapefruit brought fine prices to the growers, practically all sold to the consumer at from $3 to $4 per standard box. Pecans (fancy) are about all sold direct to the consumer and brought from 40 to 75 cents per pound by 100 pounds or barrel lots. So you see the grower of truck and fruits have no kick coming, unless against the express company; stealing of contents very common, and redress hard to get. C. E. P.

Ocean Springs, Miss.

June 15. The drought in the vicinity of Lawrence has been much worse than it was here last year up to the evening of the 11th, when we had a rain of more than three inches, and again last night of more than an inch, so that we are now well supplied with moisture. The dry weather cut short our strawberry crop and was beginning to tell on our raspberries, particularly our earliest blackcaps, which commenced to ripen one week ago. A wonderful change for the better has taken place within the past four days. We had a fair set of apples, peaches, pears and plums, but the report at our horticultural meeting was that the fruit had fallen off so much that at best we could have but a partial crop of the larger fruits. We have several varieties of raspberries, black, red and purple, and all now promise a full crop, also blackberries. Early Harvest and Mersereau, are as promising as ever. Also the Lucretia dewberry, but the McDonald blackberry, which seems to be a cross between the blackberry and the dewberry, does not suit me. If anyone wants 300 or 400 and will take them off my place they can have them. In strawberries Parker Earle and Dunlap are our leaders. Marshall is good, but does not give us fruit enough.

Lawrence, Kan. W. B.

In this section, the season has so far been quite favorable to the farmer. The wheat is all in head and promises to be a bumper crop, the Hessian fly bothering but little. Oats are doing well and corn is in some places knee high. The hay harvest is fast approaching, the crop promising well. The Medium Red clover is the principle grass grown for hay, and is usually sown in the wheat or rye in March. Alfalfa growers have already begun harvesting the first crop of the season. Owing to the droughts which often prevail during August, it is hardly possible to cut more than three crops in a season. Pasture is now about at its height and in consequence the milk flow is abundant. The price has fallen from $1.50 to $1.30 per cwt. with prospects that it may go still lower. Dairymen are not complaining, however. March pigs are scarce and it is believed that the supply of pork next Winter will be somewhat short. The strawberry harvest is in progress, and cherry picking will begin next week. Apple orchards are in poor shape. There will be some early apples but Fall and Winter apples will be scarce. The prices of farm produce are somewhat as follows: wheat 92; oats 37; rye 57; corn $1 per cwt.; hay, Timothy, $13.50; clover $13.50; dressed chicken 17; dressed veal 13; potatoes 75; eggs 17; butter 16. D. L.

Elkhart Co., Ind.

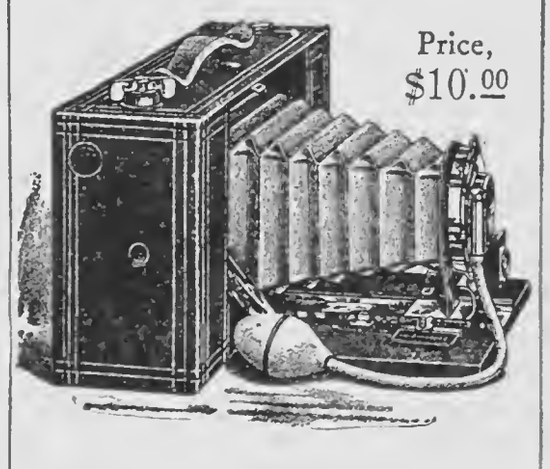
3A Folding
BROWNIE



Price, $10.00

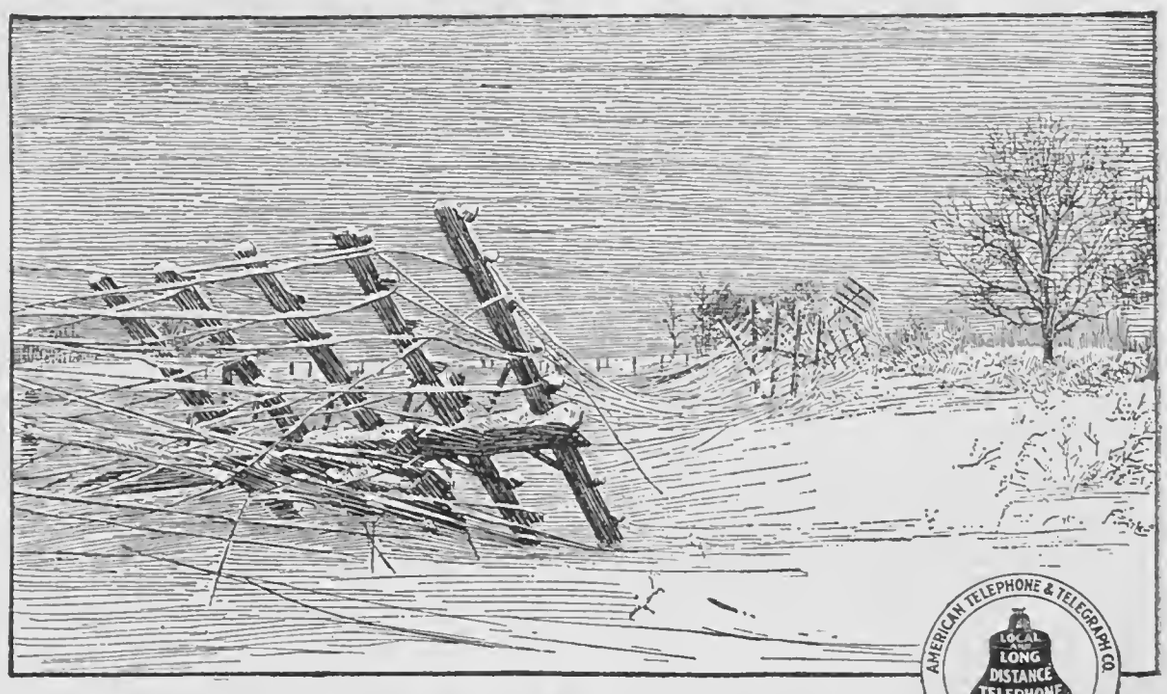
THE No. 3A Folding Brownie takes a picture just the size of a post card (3¼ x 5½ inches). Like the other Brownies it loads in daylight, using Kodak film cartridges of six or ten exposures. It is fitted with automatic shutter for instantaneous or time exposures.

The developing and printing can be done at home without a dark-room, or if you prefer, films being light and non-breakable may be readily mailed to your dealer for developing and printing.

Brownies from $1.00 to $12.00.

Illustrated catalogue of Kodak and Brownie Cameras free at the dealers, or by mail.

EASTMAN KODAK COMPANY,
387 State Street, Rochester, N. Y.



The Telephone Emergency

THE stoutest telephone line cannot stand against such a storm as that which swept the Middle Atlantic coast early in the year. Poles were broken off like wooden toothpicks, and wires were left useless in a tangled skein.

It cost the telephone company over a million dollars to repair that damage, an item to be remembered when we talk about how cheaply telephone service may be given.

More than half of the wire mileage of the Bell System is underground out of the way of storms. The expense of underground conduits and cables is warranted for the important trunk lines with numerous wires and for the lines in the congested districts which serve a large number of people.

But for the suburban and rural lines reaching a scattered population and doing a small business in a large area, it is impracticable to dig trenches, build conduits and lay cables in order that each individual wire may be underground.

More important is the problem of service. Overhead wires are necessary for talking a very long distance. It is impossible to talk more than a limited distance underground, although Bell engineers are making a world's record for underground communication.

Parallel to the underground there must also be overhead wires for the long haul, in order that the Bell System may give service universally between distant parts of the country.

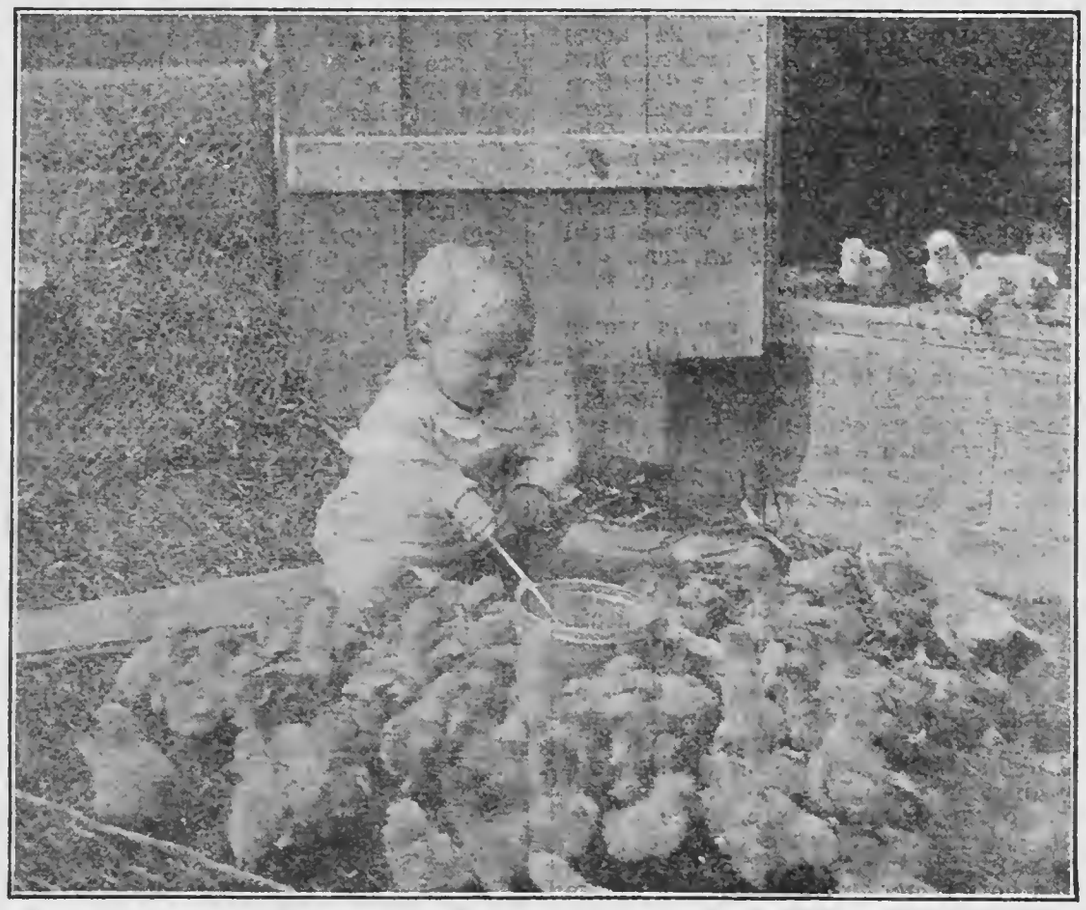
Hope Farm Notes

STRAWBERRIES.—The week beginning June 15 found us with about 2,000 quarts of Marshall berries to get off, and every part of farm work crowding. You may leave potatoes, corn or hay if you like and go to a funeral or even go fishing, but when the Marshalls turn crimson they must be attended to. By organizing our forces we got the berries picked and delivered and also kept the horses going fitting corn ground. When Saturday night came everyone on the farm could "see red" from having berries before their eyes for six days. The party that came rushing into the yard Saturday evening with the last order took the last boxes. Our crop this year is larger than ever before, and the berries on the whole seem finer. Only one patch disappointed us, and strange to say that was last year's planting, where we expected most. The four-year-old patch beat it out of sight. One reason is that most of this new bed was not mulched, and I have no doubt many of the fruit buds were killed. The four-year patch did so well that it will be fruited one year more at least.

Berries have been cheap this year in our local markets—six cents or a little more at wholesale. The crop was heavy and there can be no doubt that working people in the mill towns are short of money. We have sold at a uniform price of $3 per crate as the berries came from the field. By sorting and repacking we might have obtained more, but in the rush of such a season as this one I doubt if it would pay. I know that these berries do not cost us $3 per crate to raise. There is a small margin of profit at that price. With an apple crop which can be held for a while sorting and fancy packing will pay, but it is quite a different matter with a fragile crop like berries. As usual we have not been able fully to supply the demand, and we have not advertised or solicited for the sale of a single quart. Old customers came back and brought new ones. We have begun to do business with the Housewives' League in the county town. They wanted nearly 20 crates to start with. They buy at wholesale rates, have the berries sent to a central point and do their own distributing. Thus they can buy our berries and pay expressage at a trifle over 10 cents a quart, while the retail price of such fruit would be 15 to 18 cents. And every cent which is saved in this way will come back for more berries or peaches, apples or other produce. This plan of wholesale buying is a good one, and properly developed it will lead to a great direct trade. In some cities I understand that churches, clubs and labor associations are preparing to buy in this way. All sorts of plans for payment are suggested, but the most necessary thing is to find producers who are patient and willing to meet such buyers half way. We cannot expect to push such customers up to the highest notch or demand the pound of flesh. It will cost me no more to deal with such buying organizations than with wholesalers or dealers. There is no reason why these buying clubs should want to buy unless they can make a profit by doing so. I am willing to sell to them at the wholesale price or a little more for best quality. Every penny they save in this way will come back for more goods, and as this system of buying spreads we shall have a surer and more direct market. I hope farmers will see the point of this, and not expect to obtain retail prices when dealing with these buying clubs. We shall make far more in the end by being fair and showing such buyers that living is actually made cheaper by dealing with us. It is more and more evident that we must know about what things cost us to produce in order to know when our prices are fair.

WHAT FOLLOWS?—At least a dozen people have asked me to tell just what to do with the strawberry beds after fruiting. This has been told over and over—like the story of "Clark grass," but here goes once more. No use trying to lay down any fixed rule for all, since every berry patch should be specially handled. In a general way what you want to do is to force the old plants to make a new and healthy top and new runners and keep them all clean. There are various ways of doing that. Our plan usually is to run over the patch with the mowing machine as soon as picking is done. Let down the cutter bar and clip as close as you can. A sharp scythe or sickle would be even better. The theory of this is that Nature is a master hand at repairing damages. Cut off the top of a peach tree and a rush of new, healthy wood comes to repair the damage, and if we feed the tree properly we expect to find the fruit on this healthy new wood. Thus, when we cut off the top of the strawberry crop and keep the soil right the plant starts in to make a new top and this start gives it the energy to make new fruit buds and a newer root system. If you do not cut the old top off there will usually be but a languid new growth, and the old top will be much surer to hold and spread diseases or insects. Opinions vary as to what to do with the clippings from the old tops. Some advise letting them dry and then on a windy day running fire over the patch to destroy the old tops. The object of this is to destroy rust or other disease germs and also insect eggs. My experience is that this fire often injures the plants. I would not do it. If you know the tops are diseased rake them off and burn them in piles—away from the patch. As we have but little disease I leave the tops on the ground, working them into the soil to serve as humus.



AN EARLY START WITH CHICKENS. FIG. 367.

At the end of the season most beds are left in thick rows. Even where you start with hills by the time picking is over weeds and runners have pretty well filled up the field. Our plan is to take a small and sharp one-horse plow and work on either side of the row so as to leave a narrow strip containing the old parent plants in the center. Most of us plow *away* from the row on both sides. In this way two furrows are turned together in what was the alley between the rows, while a narrow strip of plants is left with furrows turned away from it. Others follow the exact reverse of this, plowing so as to throw the furrows *over* the row and leave a dead furrow in the alley. Under this plan most of the grass and weeds along the row are killed by being buried, while the berry plants work up through the soil. By using the weeder across the rows the ridges are broken down and the surface made level.

In reforming an old bed in this way we plan to use fertilizer while these furrows are open, scattering it along the rows. A mixture containing phosphoric acid and potash is best for this purpose—one part sulphate of potash and three parts either fine bone or acid phosphate. We consider that the heavy Winter mulch of stable manure gives us all the nitrogen we need. After putting on this fertilizer the cultivators are started to keep the middles clean and open. Then with a sharp hoe the men go in and chop out weeds and unnecessary plants. Here is where good judgment is required. As a rule the plan is to leave all the old parent plants and start new runners from them, but sometimes we find newer plants with such vigor that it pays to leave them and cut out the parents. This requires judgment which cannot be learned except by experience. Of course too, the treatment must vary somewhat as to whether the bed is to be formed in matted rows or left in hills. We start our beds in hills, yet after the second year we often find that a modified form of matted row pays best. At any rate after settling upon what you want the plan is to let enough young plants grow to give you the desired stand and then keep weeds and extra plants chopped out. Refitting old berry patches is much like keeping old hens. Some poultry men say pullets are the only profitable stock, so they sell out everything except a few breeders at the end of the season. Others keep the hens three or even four years. Many berry growers fruit a patch one year and then plow the ground and get a second crop of turnips or celery, or cabbage. Others as we do refit the patch and pick four or five seasons. Planting and cultivating in hills as we do, I do not think we can afford to pick one season and then plow up. At the same time I must admit that cleaning the old beds is expensive. This is one of the things which cannot be put into any cast-iron rule. You must use your brains and figure it out.

How are strawberry plants potted? Is a special soil required, size of pots, etc.?
Worthington, Ind. C. C. B.

This is the way we do it. No doubt some more experienced grower will tell us a better way. We use small two-inch pots, tin cans, paper pots or anything that will hold the soil. We make a good compost of one part fine manure or the dirt under the manure piles and three parts good soil. The pots are soaked in the brook and filled with this damp compost. We prefer the first runners from the parent plant, but this does not matter so much except that we get the pots earlier. The runner starts from the plant and at the end of a joint 10 inches or so long puts out little roots and leaves. With a trowel we dig a hole in the ground, put in one of our filled pots level with the surface, put the joint at the center of the pot and a small stone on top of it to hold it firmly down. The joint proceeds to grow into a little strawberry plant with its roots in the pot. Another joint grows out from it, and this can be potted in the same way. With favorable weather the roots of the little plant soon fill the pot, while the top makes a good growth. After soaking the pot in water a few gentle taps removes it and the plant is left with a round ball of soil held together by its roots. This can be sent long distances in good condition, and when set out and properly cultivated the plant makes a good start. We handle a good many of them, but caution our people not to believe the big stories told about their yield the following season after planting. As a rule one spray of fruit is all you can expect. H. W. C.

Plow Cover Crops Early.

MY soil is heavy, packed, lacks humus, and is sour. Our season is very short. I have in about 10 acres of corn for the silo. I wish to plant something to plow under. My plan is to put in Alsike clover, white turnips and rye at the last cultivation of the corn. This will be from the middle to the last of July. The corn is cut about the middle of September. Next Spring I wish to plow under this green crop. Our seasons being so short, would it be advisable to turn this under in time to put in corn, or would I better wait and secure a greater growth? I. J. D.
Wardsboro, Vt.

We should plan to plow this cover crop under early, in time for another corn crop. By waiting longer you will obtain a heavier growth of this green crop, but should the season prove to be dry, the rye will dry out your land so thoroughly that it will be difficult to plow, and you will feel the bad effects of it through the season. In a moist season the cover crop may remain longer, but in an average year it is better to plow early, rather than take the risk of drying out the soil. There have been a number of complaints this year from farmers who let the rye stand too long, so that the soil suffered. Good judgment must be used in handling these cover crops. Our opinion is that Dwarf Essex rape would pay you better in this combination than the white turnips. The rape will make a heavier growth, and probably provide more for plowing under.

Fraud in Vetch Seed.

LAST September I seeded a piece of "run-out" land with rye and Winter vetch—or I bought the seed for Winter vetch. I got a good stand of rye and fairly good of the vetch. The rye came through the Winter in good shape, but no vetch. We plowed in the rye with some manure, planted corn with fertilizer in the hill, went over it last week with cultivator harrow. Quite a few small vetch plants were noticeable at the time. I wish to sow some cover crop in the corn at proper time to plow in next Spring. What would you advise? I had a similar experience two years ago; though vetch did not "catch" as well as last year, the vetch now stands about two feet high in spots among the Herd's grass. Will it be of any use for hay if mowed and hayed with the Herd's grass?
Madison, Conn. F. C. D.

We have had very much the same trouble with the vetch seed, and concluded that when we bought the Winter or Hairy vetch the seedsman gave us the Spring vetch. The latter does not appear to survive the Winter. It is really a Spring crop, and some of the seed seems to winter over in the ground and sprout in the Spring, becoming more or less of a weed and a nuisance in cultivated fields. We should certainly cut the vetch which is growing in the grass, as it will make a good hay when mixed in with Timothy. Having failed several times to buy the true seed of Hairy vetch, we have concluded that the old reliable rye is the backbone of a cover crop. We should risk Crimson clover with the rye; although the clover frequently dies out during the Winter, it gives more than enough growth during the Fall to pay for seed and labor. Either rape or Cow-horn turnips, as already explained, may be used with the rye and clover. The sure thing about vetch is to raise your own seed.

Rye as a Cover Crop.

SPEAKING of cover crops, would it not be well to consider locality and climate? This Spring and many others, the ground here is too hard to plow under anything, and those who counted on using the land for something else are in a quandary. This is one of the sections where the land must be broken in Fall or Winter to be certain of using it for corn, peas, etc. J. L. W.
Albemarle Co., Va.

Yes—we have always tried to give the peculiar soil and condition in our own section when speaking of rye and other cover crops. We have had, now and then, the same trouble in having the rye grow so fast as to leave the soil hard and dry. In one orchard this year this happened, and we finally cut the rye and piled it around the trees, waiting for a shower to soften the ground before working it up with the cutaway. There are conditions under which late Fall plowing is best. In such cases we should sow the cover crop as usual and plow it under in late Fall. It will more than pay seed and labor.

Ruralisms

The Corn Ear-worm.

CAN you suggest anything to apply to sweet corn to prevent the ravages of a green worm? The mature worm is something over one inch long; begins at the small end of the ear and eats its way down. It may be found in all lengths from one-quarter to one inch or more. Would an application early in season, of hellebore or acetate of lead be of any use? Last year was the first that corn has been planted on this land (for many years at least). We had the same trouble and as I used seed from the same house (N. Y. State seed) in garden in Connecticut I cannot think the seed was infected. G. D. C.
Montgomery.

The insect in question is no doubt the corn ear-worm, which is variable in markings, but usually dull green or brownish in color, with a naked greasy-looking skin. It does a great deal of injury to a variety of garden and fruit crops, being also known, according to its host plants, as the cotton boll-worm, the tomato fruit-worm, and the tobacco false bud-worm. It is extremely destructive to sweet corn, less so to field corn. On tomatoes, they bore into the fruit, and in the South they begin to attack cotton-bolls when the corn gets too mature for them, and also tobacco. The adult is a small yellowish brown moth, and there are several broods in the season. The larva makes a peculiar galleried burrow in the ground, in which it pupates, and one of the best means of control is Fall plowing and cultivating, which breaks up these burrows. Early planted corn is more likely to escape injury but later broods of the insect are difficult to control. On tobacco buds the worms are poisoned with a mixture of dry cornmeal and arsenate of lead, one teaspoonful of the poison to a quart of meal, sprinkled on dry. The concealment of the worm while feeding, as well as the danger of using poison on the corn ears, prevents any idea of controlling the pest in this way, but Fall plowing, diversified planting, and the destruction of all caterpillars found should keep the insect under control. The late Dr. Smith says the worms are savage cannibals, too, and if more than one appears on a single corn ear, there is a fight which is only finished by one survivor devouring his competitors. Of course the seed was not infected; the insects were in the soil, and previous crops of cotton, tomatoes or tobacco would encourage them.

Bunching Vegetables.

CAN you advise me as to the number of vegetables put in bunches of the various kinds that are bunched, such as radishes, onions, rhubarb, etc.?
Delmar, N. Y. E. N. C.

When root and other vegetable crops that are usually bunched, and put up to retail at five cents per bunch, radishes should contain 10 to 12, onions five, carrots six to eight if small, beets five. Rhubarb at the opening of the season always produces the heaviest stalks and is usually bunched three to the bunch; later on when size is somewhat reduced, four, five and sometimes six stalks to the bunch. When intended for the wholesale market it is of considerable advantage to have these small bunches put up into other bunches containing one dozen and neatly tied; this will save counting when sales are made, and save much time and sometimes annoyance when the merchant is busy. K.

High Pressure for Spraying.

I BELIEVE I can thoroughly spray four-year-old trees in much less time and with less material with the pressure at 200 than at 100. I would like to get the opinion of some experienced man on that point. A. L. D.

I have talked with several people who used power sprayers, and I have myself sprayed with them. I would not attempt to grow fruit if I had to do the pumping by hand. First, because hand pumping is too hard work. Second, because more work can be done in a day with a power rig than by hand. The economy comes entirely in a man being able to do twice as much or more work in a day than with a hand pump. When using a barrel pump it will keep one man busy to supply one nozzle of the disk type, like the "misty" or "Winkle mist." If using a force pump, one man can supply two nozzles at 100 to 125 pounds pressure, but when night comes the pumper knows he has done a good day's work. When a power outfit is used at least two leads of hose can be used, the rod attached to each carrying two nozzles.

In Bulletin 248 of the Ohio Agricultural Experiment Station, (Wooster) is a list of 63 nozzles of different manufacture, and their sizes and capacities for delivering liquids. In nearly all instances, about one-half more liquid is shot through the nozzles at 200 pounds than at 100 pounds. For instance, at 100 pounds pressure the whirlpool nozzle with a disk having an aperture of 7/100 inch (.07) will pass 60 gallons of spray material in one hour, while at 200 pounds pressure 96 gallons can be forced through in the same time. An illustration of what a small power outfit enables a man to do can best be told by the experience of one grower. He used a hand outfit until last year, when he bought an engine and hooked it to his pump. By hand he put on six to seven barrels of spray material in a day. With his small power outfit and only one line of hose he is enabled to put on 20 barrels in the same time. So if a little material is wasted there is such a gain in time—the most expensive item in spraying—that the extra material is more than paid for by the greater amount of work accomplished.

I can see no economy of material in spraying with high pressure. In fact, I believe from my own experience that unless a man is very active there will be a waste of material, because of the tendency to hold the rod too long in one place, drenching the tree, and the added danger from burning of the foliage. There is an airtight outfit—a power outfit—on the market which throws such a misty spray that it is more economical of spray material than the other power outfits, but I think for the average farmer who has only 10 to 20 acres in fruit the added use he gets out of his engine more than makes up the economy of material. B.

Spittle Insects or Frog-hoppers.

OUR attention has been called to some white specks or bubbles of foam on the young Timothy stems, with small gold-colored insect in the center, this Spring. This was pretty general in the Eastern part of Erie County, N. Y. Will you let us know what this is, and if it is likely to do any harm? P. G.
Rochester, N. Y.

The "white specks" or "bubbles of foam" referred to are caused by what is known as the spittle insect or frog-hopper. If the mass of white foam be carefully brushed away a small wingless green or blackish insect will be found lying close to the stem and with its beak inserted in the stem of grass. In this position it sucks out the juices of the plant, and must interfere seriously, at times, with the growth of the grass or plant attacked.

Spittle insects are very abundant this season, and are seriously injuring pasture and meadow grasses, especially Timothy. In the tropics these insects are often injurious to sugar cane. Very little is known of the life history of the spittle insects. In Trinidad, West Indies, where certain ones attacking sugar cane have been more carefully studied, they seem to pass the Winter in the egg stage. The eggs are deposited in the leaves and hatch in the Spring, and the young bugs attack the cane, injuring it severely. There seem to be several generations during the season. Whether there is more than one generation of the species that occur on our grasses in New York the writer is unable to say.

There have been many theories advanced to explain the production of the frothy material. Some writers have said that the plant produced it, others that the cuckoo bird put it on the grass, others that the insect in the mass expelled the foam from its beak, while others believed the foam was expelled from the anal opening of the insect. Investigations at Cornell University made in 1908 show that a fluid is excreted by the insect from the anal opening, and that bubbles of air are then mixed with it by certain appendages on the abdomen. Added to this is a mucilaginous material secreted by certain glands of the body. This material stiffens the more watery fluid and just as gelatine is put in ice cream to give it body and stiffness. So far as the writer is able to find, no one has suggested a reason for the production of this frothy material. We would suggest that it may act as a protection from the heat and drying effect of the sun. It is a fact that spittle insects need moist conditions for their best development and are easily killed when exposed to the heat and drying effect of the sun.

We have very little to suggest in the way of control. There is no practicable method of destroying these insects in a meadow and still keep the grass standing. If the grass, however, is cut early before the insects become full grown they will be killed, and the crop protected from a vast horde of them the next year. To make this control most effective the grass along the roadsides and in the fence corners, and other neglected places should be carefully cut at the same time.

GLENN W. HERRICK.

Conditions in Colorado.

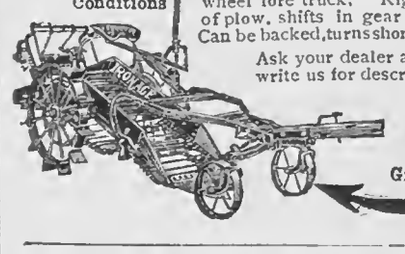
AFTER an unprecedented snowfall that remained till March, and an almost continuous spell of rain up to three weeks ago, that delayed farmwork considerably, we have upon us another spell of wet weather, which came in the form of hail and a two-inch rain following it. Although the rain was beneficial and needed; the icy stones destroyed many gardens in the eastern and northern part of Denver and suburbs. My own loss was a three-acre strawberry patch just ready to make the initial picking. The moist, frostless Spring was ideal for berries (though a little late) and the crop that was nearing maturity was enormous in quantity and extra large and clean up to this time.
University Park, Colo. G. W. H.

Pennsylvania Fruit Growers Hold Meeting.

THE Summer meeting of the State Horticultural Association of Pennsylvania was held last week (June 17 and 18) at State College. This gathering is the first public meeting to be held in the newly completed Horticultural building at the college. The principal features of the meeting were the inspection of the experimental work being done at the college in vegetable, fruit and flower growing. One inspection trip included discussions of the asparagus work being done with varieties and with crowns of various sizes. Palmetto is the most profitable variety by more than $100 an acre, and large-sized crowns are superior to small-sized by about $150 an acre. These experiments show that growers can profit by choosing Palmetto and large-sized crowns. The irrigation system was explained and shown to be a profitable investment for truckers, strawberry growers, and others. It costs about $100 an acre to install, but by its use sufficient returns may be secured, either by succession or companion arrangement of crops, to pay for the installation in two years, or even one.

The experimental orchard, where numerous soil treatments, such as sod mulch, cover crops, clean cultivation, fertilizer treatments and various combinations of these are being carried on, was probably the most interesting feature of the meeting. These are the most extensive experiments of the kind being conducted in the whole United States. They are planned on a 10-year basis and are now in their eighth year, so that results can be seen and progress reports made. An innovation was the moving picture show of chestnut culture by C. K. Sober, the most extensive grower in the State. All details of the work were shown in action, from the young growing trees to the final thrashing of the matured nuts. Colonel Sober has invented a machine for thrashing the burs, which are beaten from the trees and gathered by the wagonload for this purpose.

When you write advertisers mention The Rural New-Yorker and you'll get a quick reply and a "square deal." See guarantee editorial page.

DIGGERS
for potatoes—4 styles to choose from to suit your special conditions. We guarantee them to do the work we claim for them. All growers know that it pays to use diggers even on five acres—they save much valuable time and save all of the crop in good condition.
IRON AGE DIGGERS
No. 155 For Heaviest Conditions
Wheels, 32 or 28 inch, Elevator, 22 or 20 inches wide. Thorough separation without injury to the crop. Best two wheel fore truck. Right adjustment of plow, shifts in gear from the seat. Can be backed, turns short into next row.
Ask your dealer about them and write us for descriptive booklet.


BATEMAN M'F'G CO. Box 102D Grenloch, N. J.

$10,000.00 Backs This Drill
If this Hertzler & Zook Grain Drill does not satisfy you in every way, ship it back, and if we fail to return your money in full, paying freight both ways, we forfeit $10,000 which our bankers hold to protect you—you can't lose.
We make this big guarantee because we know this is the best drill on the market today—sows all kinds of grain, seed or fertilizer accurately and without waste. High, broad-tire wheels lighten draft. Extra large grain box. We also make a low down and plain seed drill. Sold direct from factory; saves you $10 to $20 dealers' profits.
Write for catalog and special offer.

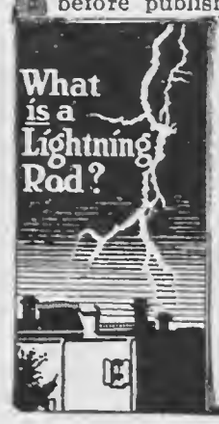
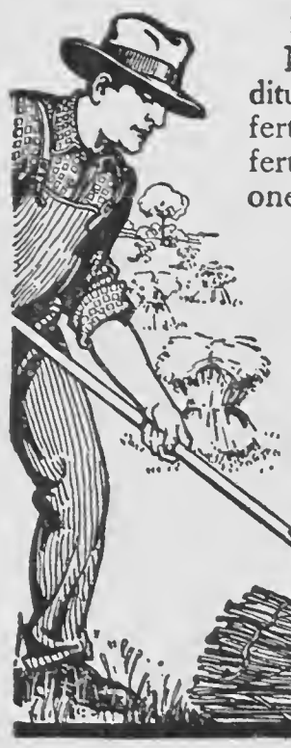
CBFR LIGHTNING ROD
65 years proof of lightning protection!
Positive protection is what your lightning rod investment should assure you. Lives cannot be replaced. You need protection—buy *the best* rod on its *record*.
Cole Bros. Franklin Rod
has been in continuous use for 65 years and not one penny's damage was ever done by lightning to any property on which the C B F R Rod was properly placed. It is the original Benjamin Franklin rod, perfected by the oldest, largest rod manufacturers in the world. Flimsy substitutes may cost a little less but they offer a whole lot less in wear and protection. Insist on the genuine C B F R rod.
Booklet Free!
Facts about lightning protection never before published; instructive, inside information you've long wanted. Here is a thoroughly reliable treatise on lightning and lightning rods written so anyone can understand it. 20 pages, 9 inches by 4, printed and profusely illustrated in two colors. Don't be in doubt; know what is truth and what is false about lightning rods. One copy free to property owners—extra copies 4c each. Write for our book today.



Cole Bros. Lightning Rod Co. 314 S. 7th St., St. Louis.

POTASH PAYS


Profit in Wheat
Wheat is profitable if the yield is good. A good yield is insured by using the right fertilizer.
No crop gives better profits for a small fertilizer expenditure provided intelligence is used in buying, and a fertilizer is used that is suited to the soil. Almost any fertilizer will increase the wheat crop, but why not get the one that will give the best profit? This is the kind in which the phosphate is balanced with
POTASH
Insist on 6 to 8 per cent. of Potash in wheat fertilizer. Some of the best growers use 10 per cent. If you have trouble in getting such brands buy Potash and add it yourself. We will sell it to you in any amount from 1 bag (200 lbs.) up. Write us for prices, naming amount needed, and for free book on *"Fall Fertilizers."* It will save money for you.

The Rural New-Yorker

THE BUSINESS FARMER'S PAPER

A National Weekly Journal for Country and Suburban Homes

Established 1850

Published weekly by the Rural Publishing Company, 333 West 30th Street, New York
HERBERT W. COLLINGWOOD, President and Editor.
JOHN J. DILLON, Treasurer and General Manager.
WM. F. DILLON, Secretary. MRS. E. T. ROYLE, Associate Editor.

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates, 60 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. We use every possible precaution and admit the advertising of reliable houses only. But to make doubly sure, we will make good any loss to paid subscribers sustained by trusting any deliberate swindler, irresponsible advertisers or misleading advertisements in our columns, and any such swindler will be publicly exposed. We are also often called upon to adjust differences or mistakes between our subscribers and honest, responsible houses, whether advertisers or not. We willingly use our good offices to this end, but such cases should not be confused with dishonest transactions. We protect subscribers against rogues, but we will not be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and to identify it, you should mention THE RURAL NEW-YORKER when writing the advertiser.

WE have a friend who is interested in farming at two ends of the country. Not long ago it was necessary to sell some live hogs on the far Western farm. The price was 7½ cents per pound. On the very same day another bunch of hogs on a farm in the Hudson Valley was offered to a butcher. These hogs were rather better than the others, and were 1,700 miles nearer the real market for finished pork. Yet the price offered was just the same—7½ cents per pound! On the same day people in New York City paid 28 cents per pound for roasting pork, and 30 for ham and bacon. The Dakota man secured just as much for his live pork as the man in the Hudson Valley, while we see what the consumer paid. In many cases a comparison of prices paid for live beeves would be worse yet against the Eastern farmer. Yet there are men in Congress who want a law compelling every farmer to raise at least two steers every year!

*

THE big live stock event of this Summer will be the meeting of the Connecticut Poultry Association at Storrs on July 29, 30 and 31. There will be full opportunity for studying the egg-laying contest, and of course there will be a full programme of practical poultry discussion. In addition to this, Tom Barron, the English breeder, will be on hand and make several speeches. We do not understand that Mr. Barron pretends to be an orator, but he will be right there with his Wyandottes and Leghorns on hand. If anyone thinks these birds are hybrids he can get right up and see if he can prove it. We understand that Mr. Barron comes prepared to open his records and explain everything he knows about his birds. We believe this will be one of the most interesting poultry meetings ever held in this country. Let us all go and see if we can learn how these English Wyandottes are able to pull the tail feather out of the American Eagle!

*

THEY have now found another factor in the success of Mr. Hitchings and others who have succeeded with sod orchards. Prof. Hedrick on page 887 states that the annual rainfall in Onondaga Co., N. Y., is 25 per cent. or more greater than in the lake counties where intensive culture of orchards is properly advocated and practiced. Thus in the Hitching's orchard, Nature supplies an extra amount of water, so that the grass cut and left as a mulch will hold this moisture in place. In the lake counties Nature is more stingy with the water supply and therefore man must work to hold as much of it as possible in the soil. That is one reason why sod mulch may be an ideal system in one locality while thorough culture is the only safeguard in another. It is astonishing to see how the annual rainfall may vary in localities less than 100 miles apart, and this variation will make all the difference in the world with crops and methods.

*

THE Utica (N. Y.) Observer prints a good letter from a New York man who went to the Far West after "cheap" land. Among other things he says:

I know something of farms in Central New York. But especially have I knowledge of farms in Oneida and Herkimer counties. I would dare wager that if one of your 10-dollar-per-acre farms of Oneida County was placed in any part of this "last best West" there would be 1,000 men clamoring for possession of it at a figure five times greater than is now asked for it.

There is no question about the possibilities on a piece of New York State land, but are there really any 10-dollar-per-acre farms in the State? We do not know where they are, and if you found them there would be something about the soil or situation which made them expensive at that price. It is a mistake to convey the impression that farms in New York are to be given away or sold at such ridiculous prices. There is no sense in locating strangers upon soil which never should have been cleared of timber. Any New York farm which is capable of supporting a family is worth a fair price and will command it.

*

THE Wisconsin Experiment Station promises a new test for acidity in soil, which is said to be superior to the use of blue litmus paper.

The new method consists of the addition to a sample of soil to be examined of zinc sulphide with small amounts of calcium chloride and water, and boiling the mixture in a flask held over a small flame, preferably an alcohol lamp. Commercial lead acetate paper, which can be purchased at the drug store, when held in the fumes of the mixture for a few minutes, will turn from light brown to a shiny black, according to the degree of acidity present in the soil. The natural color of the lead acetate paper is white, hence the discoloration can be plainly seen and will more accurately gauge the acidity in a soil than will the litmus paper test, now in use.

This ought to be a good thing for the county agent and for all good farmers. Our judgment is that at least 80 per cent. of the soil on our Eastern farms is acid. In our own case we know that some of the fields are far more acid than others. A cheap and accurate test therefore will be useful to all of us. We find that this new test and its apparatus are not quite ready for distribution.

*

MASSACHUSETTS has a good thing in what is known as the reforestation law. It was enacted five years ago at the suggestion of the State Forester, F. W. Rane. Any farmer who has run-out pastures, waste lands or lands unadapted to other agricultural crops may turn over an acreage of from 10 to 80 acres by transferring the title of the land to the State through the State Forester, whereby the State Forester may accept it and plant it to young trees. The original owner has a proviso in the deed whereby he may regain the property by simply reimbursing the State for the cost of the trees and the labor in setting them out any time within 10 years. This law is working well. The principle is correct, for the State benefits from tree planting, while the farmer does not lose the increased value of his land. The land used for the tree planting would have very little value anyway unless the State took hold of it, and the farmer is not obliged to take it back and pay for the trees unless he thinks it will pay him to do so.

*

I AM told that in a recent issue you say that the bankers, the manufacturers and the railroads are unable to produce prosperity and "good times." Is it possible you made any such statement? Do not these classes control the country's finances? Who else can make "good times" if they cannot? S. B. R.

We certainly made the statement and now make it again. If these classes could make "prosperity" we should have it with us now. Ask the bankers and the manufacturers if they consider business good today. They have been filling the papers with a tale of woe for more than a year. Ask the railroads if we are having "good times." They answer that business is so poor that they must have an increase of freight rates or fail! Now all these classes have had a chance to give this country "prosperity," yet with all their money and all their organization they confess that they have failed to bring it. They are all waiting for the farmers to buy their goods, borrow their money to "move crops" and raise a bumper crop so that the railroads and the handlers may be kept busy. This is all so evident to anyone who will give any thought that the question seems a childish one. If the money and the power of bankers, manufacturers and railroads could have made "good times" should we not have had them long ago? There is no answer to it except that these classes of business desired to give us all an "object lesson" in hard times.

*

ON the first page we give place to a signed statement by Dr. Beverly T. Galloway, who on August 1 will take up the duties of dean of the New York College of Agriculture. When we find a man who has for many years, successfully conducted a large enterprise, we like to ask him to tell us in a few words the most important things which he has found in this service. We put this question to Dr. Galloway:

After 27 years in the Department of Agriculture at Washington, I look back with pleasure on two things which I trust will remain as a permanent record of what may be obtained by a recognition of the rights of men who have consecrated their lives to the cause of agriculture. First, the bringing together of a corps of men in the Bureau of Plant Industry whose loyalty to and faith in the American farmer has never wavered, and who through team work and coöperation have made the bureau a power for good in the Department and in the country at large. Second, the bringing about of a spirit of coöperation and friendliness between the Department workers and those in the agricultural colleges and experiment stations which I trust will go far toward unity and harmony of action in all matters affecting the farmer in the future.

Now our suggestion to farmers, the Cornell agricultural faculty, and all others who are interested in trying to improve the condition of New York agriculture is to get right into line, loyally and with whole-hearted energy, and give Dr. Galloway a fair chance to make good.

*

THE Supreme Court has just given two important decisions regarding transportation and the rights of carriers. The western railroads have discriminated against certain cities or sections charging more for a long haul of freight than for a shorter haul. The Interstate Commerce Commission attempted to correct this by establishing certain zones inside of which definite rates should prevail. The railroads appealed to the Commerce Court, which overruled the Commission, claiming it had no right to make rates. The Supreme Court has now decided in favor of the Commission and declared it the final power, under Congress, to regulate railroad rates and traffic. This is in line with the recent decision which gave the National Commission power over the State authorities to regulate rates. The court also decides that pipe lines for carrying oil are common carriers and thus subject to regulation, the same as railroads, by the Commerce Commission. This is a direct blow at the Standard Oil Company which must open up its lines to competition. These pipe lines have long been regarded as private property, and most lawyers expected that the Court would declare it such. The decision that these lines must be regulated is the most advanced step in asserting the right of Congress to regulate private business that the court has yet taken.

*

WE never before had so many complaints about buying weed seeds in grass and clover. Again and again people send weeds for identification. These are taken from fields of Timothy, clover or Alfalfa, and they were never known before this year. They evidently came in seed purchased from seedsmen and supposed to be clean. This has come to be a nuisance and a great menace. The present New York law is not, as it stands, of any particular help to farmers. As Director Jordan of the Geneva Experiment Station points out, the fertilizer law requires a guaranty, and to that extent is a help. The seed law requires no guaranty of the amount of pure seed, but merely requires a label which is to be used if the seeds contain more than 3% of foul seeds. Even with the yearly bulletin giving the record of seed inspection, this law is of little value to our farmers. The Station therefore will try to help make the law more effective by making personal examinations of samples for farmers. Any farmer who expects to seed clover, Alfalfa, Timothy or Red-top this year should write to the Station and make arrangements to have a sample of his seed examined. Our advice is to buy no seed except upon an examination by the Station. It is folly to put anything the seedsman sees fit to send you into the soil without a thorough test. The Station does good work in helping you with this investigation. On the next page is a little picture showing the shape and general appearance of several of those foul weeds.

BREVITIES.

STAND by your beguns!

How many eggs have you under the water-glass hen?

THE cow that comes fresh in Winter may be a profitable Summer boarder.

Now it is reported that Kansas farmers are anxious to hire college students. It does not seem to be so in New York.

THE world seems to be growing together when dried beet pulp is sent from Spain to this country for feeding American cattle!

WHAT do you think of this proposition—that cows will make richer milk when they are fat and plump than when they are thin?

IN Cleveland, Ohio, school children receive free medical inspection, and in extreme cases free glasses are given those whose eyes are defective.

CURRANT growers make great complaint about their fruit "shelling." The fruit gets about half size and then falls off. The trouble is not due to worms, poor culture or a lack of fertilizer. It seems to be an imperfect pollenization. Bee keepers claim that a few colonies of bees will help.

THE demand for veal has increased so fast that baby cows never had such value before. It seems that thousands of beef calves which in former years would have been kept for feeding are now vealed. Formerly most of our veal came from dairy calves. All this seems to us to indicate an increased demand for poultry in the future.

CO-OPERATIVE INSURANCE AND THE NEW YORK LAW.

IN New York State there are a number of coöperative fire insurance companies. When properly handled these companies have been generally successful. In many cases they have saved the insured a great deal of money in the fees for policies. There may be some few exceptions to this general rule, but in such cases it will be found that outsiders have organized the companies and manipulated them for their own benefit. In the true coöperative companies, where farmers and home owners have organized and carried on the business, they have been economically managed and generally successful. They must be successful if they are managed economically, because in a true coöperative concern the members simply make up their own losses, and nothing more except the cost of economical administration. The companies which are run for capitalistic benefit would require a considerable profit in addition to taking care of actual losses. During the past year, however, there has been some complaint from farmers who belong to these coöperative companies. The complaint has been that some of these companies were asking for additional premiums, when the farmers thought that the premium they paid at the beginning was to cover practically all their payment. For the benefit of farmers who have asked these questions, and others who are not familiar with the subject, we give below a statement made by Mr. W. T. Emmet, Superintendent of Insurance of the State of New York. This covers the ground carefully, and explains why some of these companies are now forced by the new law to change their plans of assessment. They have no choice in the matter, as their officers are obliged to conform to the laws.

Statement from the State Superintendent.

The characteristic feature of these companies is that in lieu of the capital and surplus of stock companies, coöperative companies possess the right to assess all members. The statute classifies these companies into two groups, viz.: 1. Assessment corporations. 2. Advance premium corporations. These groups of companies transact business on different plans, and the statute makes special provisions applicable to each group.

Assessment companies charge, at the time of the issue of their policies, only trivial fees, which are calculated merely to defray the expenses of inspection and placing the business on the companies' books. From time to time, either in accordance with the express provisions of their by-laws, or to meet accumulated obligations, these companies levy and collect regular assessments. In this way the policy holders receive the benefit of insurance practically at cost, and, although the assessments referred to vary in amount, the members become accustomed to the payment of such assessments.

Advance premium companies, on the other hand, collect at the time the policy is issued a premium which is calculated to pay all losses and expense of the insurance for the full term of the policy. Should a company meet with excessive losses, or should the premium collected prove to be too small for any other reason, the company must assess its policy holders for the deficiency unless, of course, it already has a surplus on hand, over and above its unearned premium liability, to meet such a contingency.

Prior to July 1, 1910, advance premium coöperative companies were not required to maintain, and as a matter of fact did not maintain, an unearned premium reserve. Chapter 328 of the Laws of 1910, however, imposed upon this class of corporations the obligation of accumulating and maintaining such a reserve.

In the case of the Tompkins County Coöperative Fire Insurance Company in particular, this requirement of the law in respect to the accumulation of the reserve was unusually severe. The company had been collecting in advance a portion of the premium charged for its three-year policies; and at the expiration of the first and second years levying an assessment at a rate calculated upon the basis of the company's losses and expenses for the preceding year, for the purpose of making good the guarantee fund so established. Under this plan it was necessary to maintain a large reserve, unusual losses being met merely by an increase in the rate of assessment. On the passage of the law in 1910, however, all companies were required to become either advance premium or assessment corporations. The Tompkins County Company elected to discontinue its policy of annual assessments and thereafter transact its business wholly upon the advance premium plan.

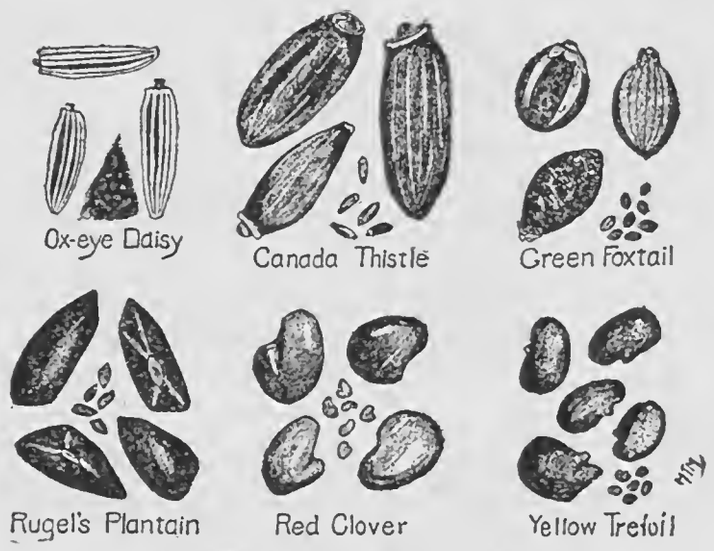
It thereupon became necessary for the company to accumulate the unearned premium reserve which, as pointed out before, was a radical change of policy. In 1911 the law was amended so as to allow advance premium corporations a period of seven years within which to accumulate the reserve. The law was further amended in 1912 with reference to the accumulation of such reserve. You will note that advance premium companies which did not possess the full unearned premium reserve on January 1, 1913, were required to make good the deficiency therein at the rate of 15 per cent. per annum. Upon failure to make the percentage of improvement required by law, the statute provides that "the Superintendent of Insurance may, in the absence of good cause shown why an assessment should not be made, direct such corporation to make good the entire amount of deficiency by assessment or otherwise within 60 days."

On December 31, 1912, the Tompkins County Company had a surplus of $79,422.05 and the unearned premium reserve to be accumulated amounted to $149,850.02. Had the company experienced a normal loss ratio it might possibly have accumulated the unearned premium reserve in the time allowed by law. For several years, however, the company's loss experience has been adverse, and by December 31, 1913, its surplus had decreased to $23,621.40, while the unearned premium reserve required by law amounted to $131,376.99, thus leaving a deficiency of $107,755.59 to be met.

By reason of the company's inability under the circumstances to accumulate funds from current premiums to make good the deficiency, we authorized the levy and collection of a single assessment of 35 per cent. for this purpose. The only alternative to this course would have been several smaller assessments at intervals, the expense of collecting which in small amounts from the company's 25,615 policy holders would have been much greater as well as more difficult, by reason of the insignificance of the amounts due upon the smaller policies.

We might add to the above statement that the purpose of the so-called "unearned premium reserve" is to protect the policy holders from the improvident use of premiums paid by them in advance. Whether the company is called upon to pay return premiums or fire losses, it is an essential of good business policy that premiums shall be applied or used only *pro rata* as the same is "earned."

W. T. EMMET,
Superintendent of Insurance.



FARM SEED IMPURITIES.

New York State News.

SUFFOLK COUNTY GRANGERS.—At the recent meeting of the Suffolk County Pomona Grange it was reported that premiums would be offered by the County Agricultural Society for Grange exhibits at the fair this Fall, three prizes of $100, $75 and $50. The movement to erect a Grange building on the fair grounds is getting under way and a resolution was adopted at the Pomona meeting to the effect that each of the 13 subordinate Granges in the county raise at least $100 for the purpose. It is expected that $5,000 will be raised by the Granges and through their influence. The September meeting of this Pomona will be held with the Port Jefferson Grange.

MEDICAL MEN DISCUSS MILK.—The eighth annual meeting of the American Association of Medical Milk Commissioners was held in Rochester last week. Nearly 100 delegates were present, among them being Dr. H. L. Coit, of Newark, N. J., who originated the certified milk system 20 years ago. Other noted men present were Dr. W. H. Park, director of the State Research Laboratories, New York City; Dr. T. C. McCleve, of Berkeley, Cal.; Dr. Henry Koplik, of New York City, and Dr. M. P. Ravenal of the University of Wisconsin. It is Dr. Ravenal who claims the essential sameness of bovine and human tubereulosis, and who opposed Dr. Koch's views in a controversy at the British Tuberculosis Congress in 1901.

FRUIT PROSPECTS IN WAYNE COUNTY.—Reports of a carefnl examination of the fruit orchards near Sodus by a party of 40 growers last week indicate that there will be a fine crop of apples, although the set has not been quite that indicated by the bloom. Kings and Baldwins never looked better, while Greenings are not quite so promising. Cherries and plums will produce well. Professor Herrick of Cornell has been making inspections for insects. Fire blight was found very prevalent on one farm, affecting both apple and pear orchards. The California apricot scale was found in one orchard, this being the second appearance that has come to the attention of the University this year. Very little is known of this scale, and Winter spraying is thought to be the best way to combat the pest.

STATE RECOVERS FOREST LANDS.—The Conservation Commission has recovered possession of 2,770 acres of forest lands in the Adirondacks as a result of decisions handed down last week by Hon. Irving Vann, official referee. These lands are located in Warren, Hamilton and Essex counties. The plaintiffs are given the right to redeem 880 acres upon the payment of approximately $5,000. Three other cases involving title to 600 acres are yet undecided, and 20 cases are yet to be tried.

FARM BUREAU WORK.—The report of the agent of the Allegany County Farm Bureau, submitted to the County Grange last week, relates some of the activities of the Bureau the past year. Among them are the organization of a cow-testing association at Fillmore, assisting in the organization of a Holstein breeders' ssociation, placed 75 to 100 carloads of lime at a saving to the county of the agent's salary, secured better rates on fertilizers, held six farm bureau institutes, made 481 farm calls, gave 73 lectures, planned 20 farms and 18 drainage systems, conducted 20 fertilizer experiments, renovated 12 orchards, and conducted several experiments in seed selection, Timothy fertilizing, testing value of ground rock prosphate, etc. F. C. Smith is manager of the farm bureau.

GRANGE LECTURERS TO MEET.—State Grange Lecturer F. E. Alexander, of Pulaski, has announced the dates for the meetings of the county and subordinate lecturers in various sections of the State. The dates follow: Aug. 11, Batavia; Aug. 12, Watkins; Aug. 13, Hornell; Aug. 14, Fredonia; Aug. 15, Batavia; Aug. 18, Cortland; Aug. 19, Oneonta; Aug. 20, Newburg; Aug. 21, Hudson; Aug. 22, Troy; Aug. 25, Watertown; Aug. 26, Malone; Aug. 27, Whallonsburg; Aug. 28, Fonda; Aug. 29, Syracuse. J. W. D.

Government Crop Report.

In the Southern Winter wheat sections the harvest is over. It is beginning under favorable weather conditions in the central part of the belt. The yield in Texas and Alabama was less than anticipated, but in other sections the favorable prospects were realized. Weather has been favorable for rapid growth in the Spring wheat regions.

Warm weather and showers in the corn belt have greatly improved the prospect, though there are still spots where the plant is suffering from drought.

Hay, oats and pasture are in good condition in the Western and Northern districts, but short in the Middle Mississippi and Ohio valleys and southward.

Weather in the cotton sections is the most favorable of the season. There have been good rains in both the Eastern and Western portions. Boll weevil very troublesome in Louisiana, Mississippi and Alabama.

In the Atlantic States there is severe drought, especially in Virginia, retarding corn and tobacco setting.

Foreign Crops.

Weather in northern portions of the Continent has been unseasonably cool, and this with drought in some sections has retarded the wheat crop. Spain, Italy and Portugal promise large grain yields. In France the area in wheat (16,045,000 acres) is less than the two preceding years, and present outlook is not favorable. Wheat harvest is finished in British India and Persia, yields being 313,000,000 and 14,000,000 bushels, respectively. European Russia is expected to have 297,041,000 bushels of wheat and 932,534,000 of rye. The total area under grain in Canada is thus reported: Wheat, 11,203,800 acres, or 188,800 acres more than in 1913; oats, 10,811,000 acres, compared with 10,434,000 aeres last year; barley, 1,604,000 acres, or 9,000 acres less than a year ago; and rye, 111,070 acres, against 119,300 acres in 1913. The condition of Spring wheat June 1 was 93, Winter wheat, 79.

Canadian Fruit Report.

The apple outlook is favorable, except in Nova Scotia, the Annapolis Valley being especially thin. In parts of Ontario tent caterpillar has reduced the crop. The Okanagan and Kootenay valleys of British Columbia will have a medium yield.

Pears are scarce in Quebec and Eastern Ontario. Nova Scotia will have about 50 per cent, and British Columbia very large.

Peaches are nearly a failure in Ontario, except the Essex Peninsula and a scattering in Lambton County. The Kootenay Valley will have no peaches.

Heavy plantings of tomatoes were made in Western Ontario to offset the peach shortage. The probability is that the supply will be exeessive.

Nova Scotia, the Niagara district, and southern and western counties of Ontario have large crops of cherries, Eastern Ontario is short.

The great grape section, the Niagara district, will have a large yield. In others parts of Ontario the scattering vineyards were considerably hurt by frost. Strawberries in the Dominion are below the average, owing to drought and Spring frosts.

Virginia Fruit Report.

Secretary Walter Whately states that Virginia expects to have a large apple crop, with the exception of Albemarle Pippins. The following percentages, based on full crops, are given for the various sections of the State:

PIEDMONT—POTOMAC TO JAMES RIVER: Pippin, 35 per cent; Winesap, 65; York, 52; Ben Davis, 70; Stayman, 55; M. B. Twig, 50; other Winter apples, 60; Fall varieties, 55; peaches, 65. James River southward: Pippin, 40; Winesap, 77; York, 52; Ben Davis, 55; Stayman, 65; M. B. Twig, 60; other Winter apples, 65; Fall, 55. Peaches, 60.

THE VALLEY: To south bonndary Rockingham county: Pippin 30; Winesap, 75; York, 80; Ben Davis, 82; Stayman, 78; M. B. Twig, 70; other Winter, 83; Fall, 82. Peaches, 70. South Rockingham county to southern boundary of Roanoke: Pippin, 33; Winesap, 75; York, 80; Ben Davis, 80; Stayman, 77; M. B. Twig, 73; other Winter, 77; Fall, 77. Peaches, 75.

SOUTHWEST VIRGINIA: South boundary of Roanoke county to North Carolina line: Pippin, 25; Winesap, 80; York, 75; Ben Davis, 77; Stayman, 65; M. B. Twig, 77; other Winter, 80; Fall, 80. Peaches, 80.

MIDDLE VIRGINIA: Pippin not grown; Winesap, 47; York, 25; Ben Davis, 35; Stayman, 25; M. B. Twig, 5; other Winter, 60; Fall, 35. Peaches, 50.

Woman and the Home

From Day to Day

The Voice of Peace.

Though now forever still
  Your voice of jubilee—
We hear—we hear, and ever will,
  The Bell of Liberty!
Clear as the voice to them
  In that far night agone
Pealed from the heavens o'er Bethlehem,
  The voice of Peace peals on!

Stir all your memories up,
  O Independence Bell,
And pour from your inverted cup
  The song we love so well.
As you rang in the dawn
  Of Freedom—tolled the knell
Of Tyranny—ring on—ring on!
  O Independence Bell!

Ring numb the wounds of wrong
  Unhealed in brain and breast;
With music like a slumber song
  Lull tearful eyes to rest.—
Ring! Independence Bell!
  Ring on till worlds to be
Shall listen to the tale you tell
  Of Love and Liberty!

—James Whitcomb Riley in The Reader Magazine.

*

A FAUCET cushion is a rubber protector that slips over the end of a faucet. It does not obstruct the flow of the water but saves breakage in dishwashing, for much of this loss comes by chipping against the faucets.

*

DO not forget that strawberry and pineapple is the most delicious of all preserves. Proportions are one quart of shredded pineapple, two quarts strawberry, three quarts sugar. Shred the pineapple and mix with sugar, let stand two hours, add the hulled strawberries, heat in the preserving kettle, and then let boil 20 minutes. Raspberries (red) may be mixed with pineapple in the same way.

*

COTTAGE cheese is usually quite plentiful on the farm, and we cannot have too many ways of serving it. One plan is to butter a platter, and press the cheese out flat like pie crust, after it has been mashed smooth and mixed with cream. It is then cut into squares with a sharp knife, and each piece lifted onto a salted cracker. A bit of olive or nut may be put on each piece, and the crackers arranged on a glass dish to serve with salad. Another method is to make the cheese into little balls, and press a nut meat or piece of stoned date into one side.

*

IF you should find among the old things stored away in attic or barn loft any of the old-fashioned lanterns made to hold candles, by all means revive them for use on the porch. We do not mean modern style with round globe, but the rectangular ones glazed with panes of glass. They are being imitated now in modern manufactures, largely to enclose electric lights; just such lanterns as one sees the Colonial watchman pictured with, and some of them carry their realism so far as to have panes of horn. A shabby old lantern may be rejuvenated by treating the metal with dull black paint. It will be noticed that city people of artistic taste make much use of candles in Summer homes among the mountains or by the sea, and any country housekeeper will find them a convenience. We do not use them to read or sew by, and often wonder how our grandmothers managed their dainty stitches by such dim light. We prefer stearic candles rather than paraffin, as they seem harder, and buy those called self-fitting, which have a tapered base that makes them fit different candlesticks. Candles are known as sixes, eights, twelves, etc., according to the number in a pound. Twelves are as thick as sixes, but only half the length, being intended for use in tall candelabra. We prefer eights, but very few dealers keep them. The sizes run all the way to forty-eights, which are tiny votive tapers. Ordinary candles are the same price whether sixes, eights or twelves, ranging in New York from 18 to 25 cents a pound. The most varied stock of candles is kept by grocers who have a large religious trade, or by dealers in church goods; many grocers do not keep them in stock at all.

The Rural Patterns.

When ordering patterns always give number of patterns and measurements desired. Prices of each pattern 10 cents.

8237 boy's suit with long or short sleeves. Cut in sizes 4, 6 and 8 years. Size 6 years requires 1½ yards for blouse and 1¼ yards for trousers, and trimming of 36 inch material. 8228 boy's box plaited suit. Cut in sizes 2, 4 and 6 years. Size 4 years requires 3 yards of 36 inch material and ⅞ of a yard 27 inches for collar, cuffs and belt. 8227 boy's one-piece bathing suit. Cut in sizes 4 to 12 years. Size 8 years requires

two yards of 36 inch material. 8249 child's rompers. Cut in sizes 2, 4 and 6 years. Size 4 years requires 2¼ yards 36 inch material and 1⅛ yards 27 inches for trimming. 7440 child's one-piece dress. Cut in sizes 2, 4 and 6 years. Size 4 years requires 1½ yards of 36 inch material for dress, and ⅞ of a yard for knickerbockers, with one yard of 27 inch material for trimming.

8288 ladies' plain blouse. Cut in sizes 34 to 40 bust measure. Size 36 requires 2¼ yards of 36 inch material. 8259 ladies' plain blouse. Cut in sizes 34 to 44 bust measure. Size 38 requires 2¾

yards of 36 inch material with ⅜ yard 27 inches for collar and cuffs. 8277 ladies' gown with tunic effect. Cut in sizes 34 to 42 bust measure. Size 38 requires 5¼ yards of 36 inch material with ⅝ yard 27 inches for chemisette and collar. 8239 ladies' one-piece straight skirt. Cut in sizes 22 to 32 waist measure. Size 26 requires 2⅝ yards of 36 inch material with 1¼ yards any width for circular ruffles. 7877 ladies two-piece skirt. Cut in sizes 22 to 32 waist measure. Size 26 requires 2⅝ yards of 36 inch material.

Asparagus Recipes.

WILL you print some recipes for cooking asparagus? O. S.

The customary method of serving plain boiled asparagus is to drain well, and then dress with hot melted butter or cream sauce. It is not cut into short lengths, though this is quite usual among old-fashioned American housekeepers, but left in the stalks, which may be laid on toast. We do not care for the toast, because it is either soddened or tough, and is thus wasted. At a luncheon recently, rings of toast were stamped out with a cutter, and each portion of asparagus stalks slipped through this ring, and then laid on an oval of toast, then dressed with hot melted butter. It gave the appearance of being in a toast basket.

Baked Asparagus.—Prepare the asparagus as usual for boiling, and boil until tender. Drain and cut in one-inch pieces. Arrange alternately in well buttered baking dish layers of the asparagus and layers of fine bread crumbs, pepper, salt and butter. Then add a cup of milk, in which one egg has been beaten, and a gill of cream, and grate over the top a generous amount of cheese. Bake a delicate brown in a moderate oven.

Cream of Asparagus Soup.—Wash, trim and scrape the stalks of one bunch, cut the "heads" one inch long and boil separately till done, then drain and set aside. Cut the rest into inch pieces, cover with 1½ pints of boiling water and cook until very tender, adding a pinch of salt and the juice of one small onion. Strain and mash through a sieve, add a pint of hot milk and half a pint of cream, thicken with butter and flour rubbed to a paste, add the asparagus heads, season to taste and serve with toasted croutons.

Asparagus With Egg Sauce.—Wash, trim and scrape one bunch of asparagus and tie into bundles of six or seven stalks. Cover with boiling water, add a little salt and boil evenly for 20 to 30 minutes until tender. Drain and arrange on buttered toast rounds on a platter or individual plates, and pour over an egg sauce made as follows: Place in a small earthen jug or pitcher the yolks of two eggs, one ounce of butter, a gill of cream, the juice of half a lemon, pepper and salt. Stand the jug in boiling water and whisk with a fork until the sauce is creamy.

Asparagus With Eggs.—Put boiled asparagus into a baking dish, season with butter, pepper and salt, then break eggs carefully and lay over the top as for ordinary baking. Season the eggs and put into the oven until the eggs are set. Another method is to prepare the eggs as for an omelet, or scrambled eggs, pour over the asparagus, and bake as before.

Asparagus Omelet.—Make a plain omelet, and when the eggs are firming lay over one-half of it boiled asparagus tips, hot and seasoned; then fold the omelet over them.

Asparagus and Green Peas.—This is a good way to serve asparagus when stalks are small, or when one has a limited dish of either vegetable. Cut the tips into small pieces and boil with green peas. There should be about equal proportions of the two vegetables. For one bunch of asparagus add half a cup of water and a tablespoonful of butter. This makes an excellent garnish for Spring lamb.

Canning Asparagus.—Straight-sided quart glass jars should be used for asparagus, so as to avoid breaking the stalks. Wash carefully, cut the right length to stand the whole stalk upright in the jar and pack in snugly, heads up; then pour in cold water slowly, until the jar is full to overflowing, and lay on the tops. Place straw or boards in the bottom of the wash-boiler, stand the jars on this, and pour in enough cold water to come half way up the jars; put the boiler over the fire, and when the water comes to a boil, boil steadily for three hours. Take up the jars, see that they are full to overflowing (if not fill up with boiling water) put on rubbers and screw or otherwise fasten the covers tight. Keep in a cool, dark place. Another recipe recommends boiling the asparagus for 15 minutes, then putting in the jar, and boiling in the wash-boiler for 1½ hours, but we think some of the stalks are very likely to be broken by this method.

Seen in New York Shops.

ONE famous glove shop, which has sold nothing but gloves for nearly half a century, makes a specialty of wedding gloves. For the bride's convenience, they will rip the seam of the ring finger in her glove, and resew it free of charge whenever desired. Their wrist-length gloves are $1.50, $2 and $2.25; eight button $2.50, 12-button $3, and 16-button $3.50 the pair. These prices are rather higher than the popular gloves of a department store, but they are of the highest quality, and of supreme excellence in cut; they are of course, made in France. Silk gloves at the same shop are 50 cents for short and $1 for long ones.

Snapping mottoes modeled after the absurd "Katzenjammer Kids" are shown among new favors. They are dolls about eight inches high with papier-maché heads, and clothed in red crape paper; each one contains 12 favors. They cost 39 cents each. Little "Kewpie" favors cost from 10 cents up, and include a great many different attitudes.

Some of the new furniture for Summer homes is painted pale gray; this is newer than white. This idea is worth copying when rejuvenating old furniture with enamel paint. Cretonne or chintz cushions in all colors are used with the gray furniture, a very cool effect being given by pale gray cretonne with shaded heliotrope flowers forming an irregular pattern. This furniture was placed upon a woven ragstyle rug of pale gray and heliotrope. Soft pink or old blue looks well with this gray furniture. Rather odd are black and white rugs, in large checks like marble tiling, and there are also black and white borders to some of the curtains, and black stripes in colored chintzes and cretonnes. Glazed English chintz is being used for window shades, such as narrow stripes of pink and white, green or blue, or even little wreaths and sprigs.

Horsehair braid, hand sewed, is being used in some of the newest hats, which are a little wider in brim than the hats of early Spring. One plain but very smart hat had a crown of white satin, slightly gathered at the top, and a brim of white braid, faced with satin. At either side of the crown was a bunch of bright red cherries.

A good many linen one-piece dresses are made with skeleton bodices, which, while a reminiscence of the discarded "jumper waists," are very different from them. In some of these the back of the skirt runs up to form part of the waist, meeting shoulder straps or close bretelles; others have a kimono effect. Of course a blouse of thin white material is worn underneath. Some of the one-piece linen dresses have a coat also, thus forming a jacket suit, the little kimono coat being very short, and cut away in front.

"Tiffin tables" from Hong-Kong have collapsible stands of basswood, stained brown, supporting two trays of split bamboo, one tray on top, one near the ground. They are very Oriental in appearance, and delightful for serving refreshments on the porch; they are very light, and may be folded up out of the way. Tables with 27-inch trays are $5; with 32-inch trays $6.

Lamb's wool quilts covered with Japanese silk in a great variety of shades are $12.50 each. They have the advantage of being extremely light, as well as warm. We have often thought that wool-filled comfortables of various grades might prove a salable product for sheep-keeping farms.

A wonderful little frock of white dotted swiss, which was priced, as an imported model, at $50, was quite simple enough for a very modest purse. The waist was one of the shirred models gathered along the edge of the V-neck; the sleeves, which were wrist length, were all in one with the waist, and were trimmed with a row of small jet buttons all the way from the shoulder to the wrist, which was finished with a net ruffle. The plain skirt was trimmed with a serpentine ruffle of the swiss, bordered with a narrow band of black net. The ruffle, which started at the waist line on one side, curved down across the front to the back, sweeping round to the middle of the front about a foot above the hem, where it was finished with a large black velvet bow.

Jelly Making Simplified.

THE new housewife usually hesitates about attempting making jelly. Even some older housewives do not know the scientific method of jellying. It is true that some things will "set" easier and better than others, but nearly all kinds of fruit can be made to jelly, provided the pectin, jellying principle, is present, and if it is not, no amount of sugar or cooking will make the product jelly. Currants, apples, quinces, and citron all contain pectin in large degree, and these may be combined with other fruits lacking this jellying quality. Not that the fruits mentioned are all that will jelly alone, by any means. Grapes are rich in pectin, and especially green or not very ripe ones. The green grapes' juice may be combined with other fruits as an aid to clear, solid jellying.

Now to take up a concrete example of jelly-making. We will begin with currant jelly, which is one of the most popular varieties, most delicious, and really very easily spoiled by long cooking. Do not be tempted to use the currants with the stems on. Some very good jelly makers advise that method, but I know by actual experience that the jelly made that way has a less delicate flavor and a much darker color. It does not take long to stem currants, and it pays in jellying. In selecting currants choose those that are a little green, although ripe ones will be all right, those that are at least a third green will jelly sooner, and make a better flavored, more beautiful colored jelly than those thoroughly ripened. Over-ripe fruit of any kind is not suited to jelly-making. Having stemmed the currants, put them into a granite or porcelain vessel and cover with water, that is not alkaline. In many districts the water is so alkaline it counteracts the acid in the fruit and jelly making is rendered difficult, if not impracticable. Rain water answers very well in case such water is the common household product. Do not make the mistake of using too much water, as the extra amount will have to be cooked out, and long cooking spoils the color and takes away the delicate, fresh flavor of the jelly.

Heat the currants rather slowly, and crush with a wooden potato masher, when well-heated so that the pulp is soft and juice exudes freely. Remove from the fire and pour into a jelly bag. A square of cheese cloth, sewed up diagonally makes a very good bag. Hang or place somewhere, where it can be held stationary and let the juice drain out. If your object is the very highest product then do not press or squeeze, but if you want the most jelly for the amount of fruit used, then press and squeeze until all the juice is crushed out. This might make the jelly a little cloudy, but if it is strained again through a thick bag, like flannel, it will be just as clear and transparent as that made from the liquid that merely drips out itself. In fact I have found that the jelly stiffens better if the fruit is pressed. It seems to be the pulp part that holds the greatest balance of the pectin. Having the juice extracted, measure and put over the fire. Measure an equal quantity of sugar and place in the oven. Do not let it get too hot, so that it either scorches or melts, but if such a thing should happen, do not let it worry you, because if it is candied or scorched it will merely rise on top of the jelly and can be skimmed or strained off. The sugar should get real hot however. Let the juice boil 20 minutes, no longer, then add the sugar, it will strike the boiling liquid with a hiss, and will dissolve almost immediately. When the sugar is dissolved skim the jelly till clear, then turn through a bag into the jelly glasses, or strain, and put in glasses after the straining. Do not let the jelly cook more than three minutes after the sugar is added, as it soon turns dark and the flavor is impaired.

To put this whole thing in a few words, wash and stem fruit, cover with cold water, bring to a boil, and mash, turn into a jelly bag and drain, measure your juice and the same quantity of sugar. Put the juice over the fire alone, and the sugar into a warm oven to heat. Boil juice just 20 minutes, add the sugar, and boil two minutes, skim well, and strain. Put in glasses. That is the recipe in a nutshell, but the explanations are needed by the unaccustomed jelly-maker. One need not worry, or test the liquid. It will jelly without any such bother. Frequently the jelly jellies on the spoon and edges of the utensil used, but even if it does not, do not cook longer than the time specified. Do not be tempted to use more than enough water to cover the fruit. If you want to experiment, then do so, but if you want jelly without experiment and with sure success try the above. I tested it more than 20 years ago, a little doubtful of the result, but the rule has been followed in all the succeeding years, and it does not fail. If the jelly does not solidify at once do not let that disturb you. In this case, put it in a sunny window, and cover with thin cheese cloth, to allow the action of sun and air upon it. Finally cover with melted paraffin. You will have a jelly the finest flavored, and something that will keep indefinitely, without crystallizing or moulding. The paraffin seals it tight, unless it is disturbed and loosened. Currant jelly can also be made without cooking at all. Currants are crushed and juice poured, or strained or pressed off. Add an equal amount of sugar, put into rather shallow glasses, cover with cheese cloth, and place directly in the sun and air. This will eventually form a jelly of the most ambrosial type. It should not be kept in too warm a place save for the action of the sun.

It is a good plan to can some currant juice to mix with other fruits later. Strawberries, not too ripe, even a little green, make a delicious jelly, but may be combined with a little currant juice to the betterment of the same. Let me say in passing that white currants make a jelly just about the same color as the red ones. Red raspberries make a fine jelly, and may either be used alone or with a little of the currant juice. Gooseberry jelly is made identically the same as the currant jelly, and I prefer the berries quite green. Pieplant is something that is difficult to jelly, but with a little pectin from some other fruit it jellies all right, and there is a time when it will jelly itself, alone, but this time is in August when the stalks are well-matured. Always select well-matured stalks of pieplant for jellying. Black raspberries, black currants, and blackberries all make delicious jelly but are used more for jams. The jellying is done by the first rule given, but in nearly all the Summer fruits a little of the currant juice adds piquancy and acidity and aids the jellying.

Pineapple juice does not jelly readily, but if this is canned in the season, and made into jelly with tart but very slightly flavored apples, it makes a jelly a little unusual. Wild plums, wild grapes, the buffalo-berry, all make fine jellies. Tame plums should be jellied while a little green, so also should tame grapes. Peaches will not jelly, nor apricots, but will form a most delicious product, combined with apples.

To make apple, or crab apple jelly, merely wash and cut up the fruit, excluding the seeds, cover with water and cook tender, press out the juice, and follow the regular rule as to time of cooking and amount of sugar used. These all jelly readily and look beautiful. Quinces, hold a large amount of pectin, and may be jellied alone or with apples. Usually the apples cost less, and the quince flavor is strong enough to supply half its own bulk of apple with the regular quince flavor. In using quinces for jellying, it is an economical plan to use the body of the fruit for preserving with sweet apples, and only the peelings for the jelly. Every seed must be excluded, as the seeds form a viscid, sticky substance which will never jelly, and is really unsuited for food. We usually use the peach skins the same way, for peach jelly. Some use the juice from canned peaches, but it is a poor plan, because one never knows just how much extra sugar to supply, and another thing, it is well to use only sufficient water or syrup to can the peaches properly, and fix your jellying liquid according to the right rule.

ROSE SEELYE-MILLER.

IT is better to admonish than to reproach; for the one is mild and friendly, the other harsh and offensive; the one corrects the faulty, the other only convicts them.—Epictetus.

Homemade Yeast.

HAVE you ever printed any recipes for homemade yeast, and will you repeat it? M. A. R.

The following recipes were given in THE R. N.-Y. several years ago, and have been tested with satisfaction by many readers:

HOMEMADE YEAST.—Pare and boil four good-sized potatoes; when done, mash them fine. Put half a cupful of dried hops into one quart of water, and boil 15 minutes. Put one pint of flour into a bowl, strain over it the boiling hop water, add the mashed potatoes, and beat until smooth, then add half a cup of sugar and two heaping tablespoonfuls of salt. Turn into a stone jar or bowl, and let it stand until lukewarm, cover and ferment three or four hours, stir it down every time it comes to the top of the vessel, then put it into a jar or large bottle, or something you can cover tightly, and stand in a place where it will keep very cold, but not freeze. It will keep two weeks. Save one cupful of this yeast to start with next time.

VIRGINIA DRY HOP YEAST.—Take as many hops as you can grasp in your hand out of a sack (or a few more won't hurt), put in a porcelain or granite pan, then add two quarts cold water; boil briskly for one-half hour; have boiling water ready to fill up pan as full as before boiling. Then have ready a gallon jar with 1½ cup wheat flour, one large spoonful of sugar, one teaspoonful of salt; mix all together and strain the hop tea in jar. Stir all lumps out, set away to cool. When lukewarm add a good yeast cake or any good raising to start it. Then let it stand one day and night, stir down once or twice during this standing; then pour in pan, take one part wheat flour, two parts cornmeal, make as stiff as dough for light wheat bread. Make in small cakes like those you buy; put on floured cloth on a board and dry, turning till real dry. Put in paper sack, keep tied tight. Keep where it will not freeze. This will last a family of seven or eight for five months.

More About Rose Beads.

ON page 800 you print an article on rose beads. The using of an old rusty kettle is very offensive to me, and I send you directions from "Young Folks," from which we made hundreds of beads last year of all sizes. We used the petals of the roses ready to fall, gathered them every morning and used a peck measure, pressed full of petals for one batch; added no perfume, their own fragrance is at the end of the year still scenting my bureau drawers. We used a new thin, black pan, the five-cent quality; I think they are called sheet iron, and can be purchased at any of the five and ten cent stores. Our beads have been greatly admired. This year we are going to make up all the rose petals we can gather. For uniform size we measured each one, by different size spoonfuls of pulp and rolled them between glass when partly dried, which made them glossy; do not use oil.

A large quantity of rose petals is required, even for a single string of beads. The petals may be of any or all kinds and colors, but care must be taken to remove all the stems, dried petals, leaves and other foreign substances. The petals are then ground to a fine pulp in an ordinary food chopper. It is necessary to run the pulp through the food chopper six times, so that it may be as fine and smooth as it is possible to make it. A surprising quantity of juice runs from the petals as they are reduced to pulp, but all of this is saved and well mixed with the mass.

The pulp is a dirty white or pink color. It is spread in a thin layer on sheet iron pans, when it soon begins to blacken by the oxidation of the iron. Every few hours it is turned and stirred, in order that the entire mass may become uniformly black. The blackening process may be greatly hastened by adding a few drops of tincture of iron. As a rule, a very little attar of roses is added to the pulp, so that the beads may be appropriately perfumed.

The next step is to mold the beads. As soon as the pulp has dried sufficiently to work easily and hold its shape small quantities are taken in the hands and rolled between the palms until perfectly round. Of course, the balls are made much larger than the finished beads are desired to be, as they shrink in drying to about one-third of their original size. Then they are placed upon plates or pans until partly dried, when they are again rolled to correct any irregularities of shape. Then they are pierced with large pins, and left upon these pins to dry. Those who are particularly skilled at bead making sometimes ornament each bead in any manner suggested by the individual taste and ingenuity. A. L. S.

HOME COMFORT

A Good Percolator is a necessity in every household. We will send you the percolator described below, delivery charges prepaid for

Three (3) New Yearly Subscriptions or Six (6) Renewal Subscriptions

(One of these may be a renewal of your own subscription.)

Percolation is the automatic process of pumping hot water up the tube and over the coffee grounds extracting only the good of the coffee, leaving the coffee free from any muddiness or bitter taste—a perfectly clear, delicious, full strength beverage, wholesome and always uniform. This Seven-Cup percolator is made of the best grade Lake copper, handsomely nickel plated; aluminum basket; rosewood handle—handsome pattern. The percolator is of simple construction; no complicated mechanism to get out of order; easy to operate; easy to clean; absolutely sanitary.

The percolator "pays for itself in the coffee it saves." The retail price of this percolator is three dollars.

If your neighbors are not subscribers to the Rural New-Yorker, get their subscriptions. If they are subscribers, get their renewal.

Rural New-Yorker, 333 West 30th St., New York.

Live Stock and Dairy

Corn for Grain and Silage.

IT might be interesting to H. S., Union, N. Y., to know how farmers here meet the same problem which he has to solve. Most of us keep cows, and also need corn to feed to hens as he does, so we grow field corn of a flint variety, let it grow until the ears are well glazed, then break them off, throwing four rows together in small piles. The stalks are then cut by hand and put into the silo. If a harvester was used the corn would be crushed. We usually begin to husk on the broken-off ears right away, as I feed the softest ears at once, running them through hay cutter which shells some and cuts the soft cobs up so that the hens eat quite a little of it. It is usually quite late before all is husked but it keeps well in the husk and dries out quickly in the crib after husking. Of course it is not equal to grain that is ripened on stocked corn and stalks with good ears should be cut out while the corn is being picked off and stocked for seed corn. A corn husking crew operated in this section a few years ago, and a good many stocked their corn, had it husked by machine and the shredded fodder put into their silos; except where quantities of water were run into the silo with the fodder it was a failure as far as good feed was concerned.

Massachusetts. MRS. ELLA E. LUKE.

Building an Octagonal Silo.

WILL you give the specifications for building an octagonal wooden silo, large enough for a dairy of 24 cows? Would chestnut lumber be suitable for the same? I can get it sawed from my woods at a moderate cost. Would it need to be planed? E. A. P.

Chatham, Pa.

For some time there seems to have been very little inquiry about octagonal silos, the building of both cement and round ones having seemingly monopolized the inquiries. I think there is such a silo put out by a St. Paul firm, an iron frame in which the sides are held firm, and can be replaced when decayed. The octagonal silos about here, are built by half lapping 4x6 inch stuff at the ends, and as each layer is added, spiking them to the layer below with 30-penny nails. Chestnut lumber would be very durable, though it would take a large amount of lumber to erect a silo 60 feet in circumference, and 30 feet in height. For the size of silo you want, you will need to cut the pieces nine feet in length, so when half lapped at the ends, it will give you a clear eight feet to the inside. It will be better to have the stuff sized—not edged—so that in laying, you will not have layers of different thicknesses, as this would invite ingress of the air. Be sure to have the inside face perfectly true, so as to offer no obstacle to the settling silage. Between each layer, have a good liberal "streak" of gas tar to insure an airtight joint, and be sure to have enough at the joints of the half laps. About each seven feet you will want a man-hole in the side. One 18x30 inches will be ample. Better have a frame doorway with jambs, so the little doors will fit it snug, and the pressure of the silage will hold it in place. Possibly if the whole interior of the silo was painted with gas tar and gasoline, it would be a good thing, but do not paint the outside, as that would not let the timber dry out. A friend suggests when the silo is finished, that these little corners be rounded with a little good cement mortar, and then painted. One thing is certain; with such a silo. there will be no shrinking of staves, hoops dropping off, and collapses of the structure, or rats gnawing through the walls. JOHN GOULD.

Ohio.

Bull Beats the Hired Man.

THIS is not a joke, nor a newspaper fake; but a fact, and an unpatented idea which any dairyman is free to utilize. To J. W. Berry of British Columbia, an economist of local celebrity, is all credit due for this original idea, practically demonstrated. Mr. Berry is the owner of a 16-months-old bull of best "Bred in British Columbia" stock. The animal needed daily exercise, also shoulder development; so Mr. Berry set his wits to work on physical culture exercises for growing bulls, along lines which should prove both efficient and remunerative. A tread mill was constructed, and for one hour, night and morning, the young bull exercises therein. As he treads his endless path, shafting revolves, pulleys turn, and belting conveys power to the milking apparatus, and the herd of 40 cows is milked at no extra cost for labor. Mr. Berry says the exercise is a benefit to the health and development of the bull, and that he is laying on a pair of shoulders that will score points at the prize competitions at the Fall fairs.

British Columbia. E. R. C.

Hard Churning.

MY cream is hard to churn. It takes me from two to two and a half hours to do it. The cows have fresh pasture, part woodland and part open, fresh running water. They get plenty of salt, for it is in their manger all the time and we feed them mixed chop. We separate our milk with a hand separator and do not mix our cream until thoroughly cool, using a barrel churn which turns over and over. We have the Holstein cows and none has been milking long. I. S. K.

Batavia, N. Y.

I see nothing wrong in your treatment of cows or cream, so far as your information goes. The cream should be ripened as quickly as possible by the use of a starter, when ready to churn. Sour cream or buttermilk is all right for this purpose. A fairly sour cream churns better than one not thoroughly ripened. Too low temperature may also give trouble, though at this time of year the cream should not ordinarily be above 65 deg. Thick cream also churns better than thin. C. L. M.

Bacterial Content of Certified Milk.

PLEASE let me know what bacterial count is allowed in certified milk for New York City, Boston, Philadelphia and Washington. G. D. B.

Pennsylvania.

The New York, Boston and Philadelphia standards for certified milk require that the bacterial count shall not exceed 10,000 per cubic centimeter; with regard to Washington the health officer of the District of Columbia states:

I regret to advise you that there is no certified milk sold within the District of Columbia. A number of years ago a committee was appointed from the Medical Society of this jurisdiction to prepare rules and regulations governing the certification of milk products but, so far as I am aware, no such milk product has ever been certified by them nor have they any modern rules and regulations governing such certifications. My last information from the Secretary of the Medical Society was to the effect that this committee is not now in existence.

W. C. WOODWARD.

FEEDING QUESTIONS,

Dairy Ration.

WITH good mixed clover and Timothy hay, considerable Alfalfa, sufficient silage to give each cow 35 pounds per day, what in your mind, is the best of the following feeds to use, and best mixture of grain? Sugar feed $26 per ton; molasses feed $23; bran $29; corn chop $31; cottonseed meal $1.65 per cwt.; brewers' dried grains $23 per ton; gluten $30. W. B. G.

Pennsylvania.

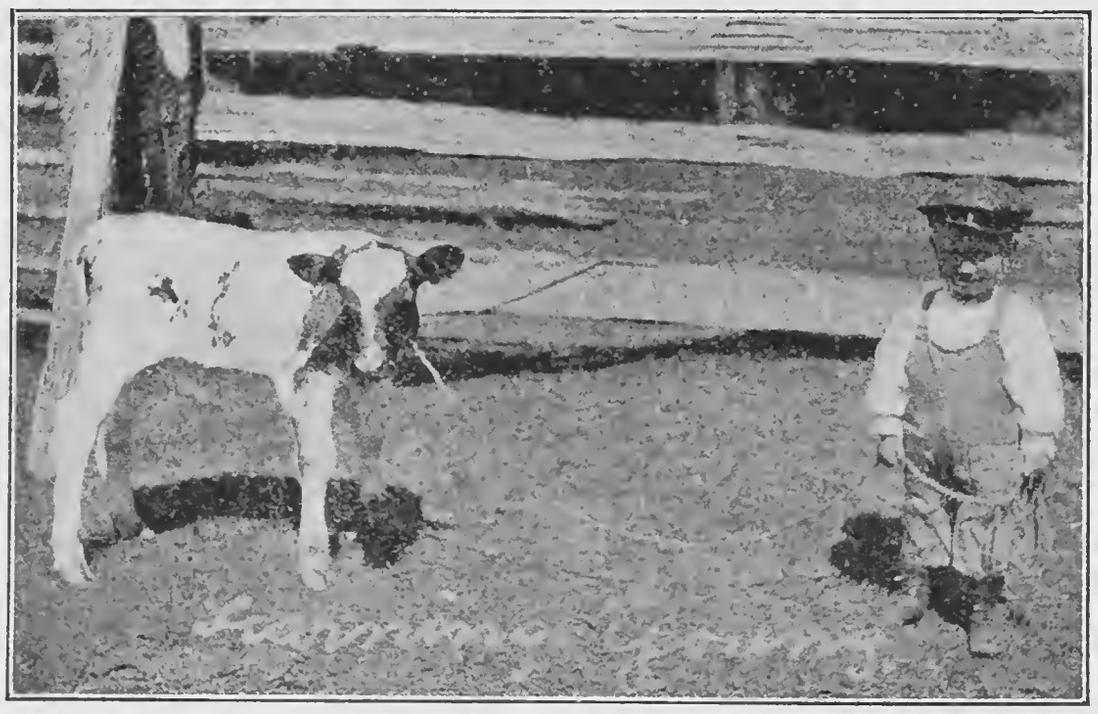
From the feeding stuffs mentioned I would select the following ingredients for milch cows: Five pounds dried brewers' grains; two pounds cottonseed meal; two pounds corn chop; one pound wheat bran. This will make a well-balanced ration which will be readily eaten after your cows get accustomed to it. This change, however, should be made gradually, extending over a period of a week or 10 days at least, as any sudden change in the composition of a ration is very apt to produce undesirable results for a short time. C. S. G.

Decreased Milk Flow.

WE have a Jersey cow, calved three months ago, and at present giving 16 quarts of milk. She is decreasing in the milk flow and by scientific feeding I expect to increase it again. Can you give me a balanced ration from the following feeds? Gluten, bran, cornmeal, middlings, and brewers' grains. Should this be fed wet or dry, before or after milking? How much should I feed at a time? The cow is let out on the pasture all day and after milking except in bad weather. J. A. L.

New York.

A mixture of equal parts of gluten, cornmeal and brewers' grains will help you to keep up the milk flow. This should be fed dry, twice daily, and preferably when you let the cow into the stable, though this is not of particular importance. Probably two or three pounds at a feeding will be sufficient at present, though as the pasture deteriorates you will have to increase the amount. C. L. M.



BEGINNERS IN THE DAIRY BUSINESS.

Ration for Freshening Cow.

WILL you give a well-balanced milk ration from following foodstuffs? Cow is about to calve. Cornmeal, bran, middlings, ground corn and oats, gluten, cottonseed meal, and hay for roughage? G. L.

For a warm weather ration the following will be excellent: Bran, two pounds; cottonseed meal, three pounds; corn and oats, two pounds, and gluten one pound. This is an average ration, the amount of which you may vary according to the production of the cow. For a cold weather ration add one or two pounds of corn meal. C. L. M.

HE: "You'll be sorry some day that you didn't marry me." She: "Well, I'd rather not be married and be sorry I wasn't married than be married and sorry I was married."—Judge.

BENEVOLENT OLD GENTLEMAN: "Don't you think fishing a cruel sport?" Fisherman: "I should think it was. I've been sitting here five hours and never had a single bite, I've got three wasp stings and been eaten up with flies, and the sun's taken all the skin off the back of my neck!"—London Farm and Home.

KERRY CATTLE AS ECONOMICAL PRODUCERS.

BREEDERS of other than Kerry cattle question whether this little Irish cow, hardened through centuries of foraging on meagre pastures, will become a producer of such efficiency that she will prove profitable on the average American dairy farm. For economical use of feed she has a competitor in the Ayrshire, which has outdistanced the Kerry cow in numbers in America. The Ayrshire is a larger cow, has many champions in the United States and is being well advertised. There are scarcely more than two or three dozen breeders raising Kerry cattle, and these men are enthusiastic, regarding this as a breed which will afford efficient service on barren pastures and rocky hillsides.

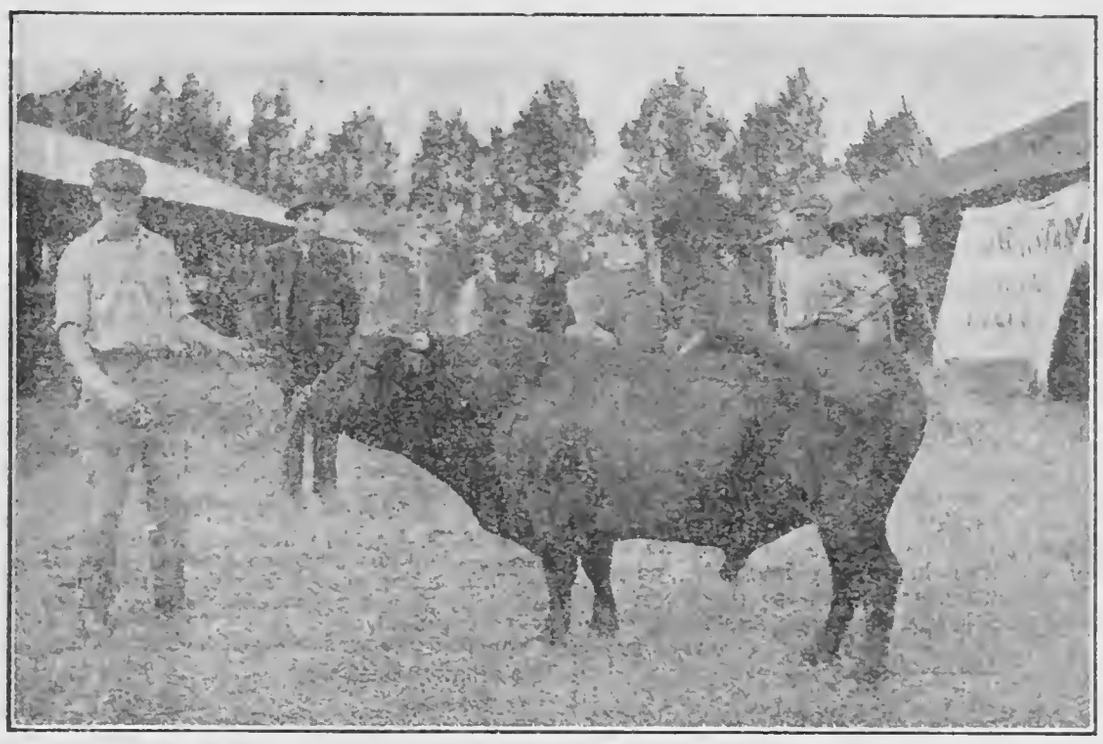
According to British ideals of the Kerry cow, she should not weigh over 900 pounds when in breeding condition, and the Kerry bull is allowed 1,000 pounds weight. This places her as to weight on the average with the Jersey, and from 500 to 600 pounds less than a mature Holstein cow. The English Kerry and Dexter Herd Book gives the following description of the cow: "She should be long, level and deep, her color black, her head long and fine, her horns fine at base, mottled or white tipped with black, upright and cocked, her eye soft and prominent, her bone fine, her coat in Summer like satin, in Winter long and thick, her udder should be soft and large, but not fleshy, protruding well under the belly, teats being placed square and well apart, the milk veins prominent and large, the tail should be well put on and have at the end long fine black hair. A small amount of white on the udder and underline need not disqualify. The bull should be whole black without a white hair, should have a long head, wide between the eyes, of masculine character, throat clean, horns medium length, mottled or white with black tips, turning backwards; withers fine, back straight from withers to setting on of tail which should be long, fine, tipped with black hairs."

There has been little systematic effort in the United States to ascertain the economy in milk production in the breed. In Ireland and England there are many herds, and very satisfactory results seem common. An Irish breeder says the average quantity is about 12 quarts daily while many cows producing 20 and 22 quarts are familiar to breeders. One Kerry produced 1,100 gallons milk in a year. This is about three times the amount produced by the average American farm cow. The Kerrys test from 3½% to 4½%, and some as high as 5%. A New York breeder stated several years ago that his Kerrys yielded 15 to 20 quarts daily and that none tested under 4½% fat.

The organization of the American Kerry and Dexter Cattle club four years ago was effected through correspondence. Prof. C. S. Plumb of Ohio State University started the movement. Any animal, according to the article of association, imported from Ireland or England up to January 1, 1912, from ancestry registered in the Royal Dublin Society's or the English Kerry and Dexter Cattle Society Herd Book, any American or imported animal from purebred unregistered ancestry, was accepted for registry until January 1st, 1912. Although the Kerry and Dexter cattle are registered by the same association they are separately classified, and no cross of Kerry and Dexter shall be registered.

In Britain the Ayrshire is termed the poor man's cow, the Kerry is considered the poor poor man's cow. The Kerry will even thrive on poorer land and on scantier pasture than the Ayrshire. The Kerry will produce results on poorer feed than any other breed, and with less care. She will withstand rigorous weather conditions which would deprive any cow of producing ability. The Kerry possesses abilities which in all probability would recommend her to the farm in cold locations, or on hilly and mountainous farms with scant vegetation and subject to extreme weather conditions.

W. J.



A WELL-BRED SPECIMEN OF THE KERRY CATTLE.

Azoturia.

I have a horse six years old that I use double for all kinds of hard work. Last week after standing in the barn five days I took him out; after driving for about half a mile he began to sweat and trembled so that I had to take him from the pole. By the time he was clear he went down three times, one after the other. I called a graduate veterinarian who called it black water. By the second day he seemed to be getting better, by the third day he was so stiff in his front legs that I could hardly get him out of the stall. I called the veterinarian again, who left me some medicine, but the horse does not get any better, lost all appetite and appears to be very lame in front legs; not able to get up alone. What is the trouble and what will cure him? F. F. F.

Massachusetts.

Azoturia (black water) certainly was to be suspected as the cause of the symptoms noted. It comes on after a period of one or more days of idleness in the stable. No horse ever should stand for a single day idle in the stable, and feed should be greatly reduced in amount of richness when there is no work for the horse to do. Support the horse with slings. Feed light, laxative rations. Rub liniment upon the affected parts once daily. Let the veterinarian give nux vomica in increasing doses. Azoturia sometimes affects the fore legs; but commonly the hind legs are attacked and often the muscles of the thigh waste away.

A. S. A.

Abnormal Breathing.

I have a bay horse seven years old that was very sick when he was brought here from the West about two years ago. Since that time he has breathed quite hard; has no cough or discharge from nose, but blows his nose very frequently. Can you advise me what to do for him?

B. M.

Have a graduate veterinarian examine the nostrils, as one of them may contain a tumor (polypus) which may be removed by means of an ecraseur. If no growth is there the lining membranes of the nose may be thickened, and for that there is no specific remedy. It is purely a case for treatment by the local qualified veterinarian, as we cannot prescribe confidently without making an examination. If the animal is a "roarer," from laryngeal hemiplegia (paralysis) the veterinarian will have to operate on the larynx.

A. S. A.

EMPLOYER: "Good morning, Robert. I hope all your family are well this morning." Office Boy (unsuspectingly): "Yes, sir, thank you." Employer: "I'm glad to hear it, Robert. There is to be a baseball game this afternoon, and I was afraid it might have a fatal effect on some of them."—Boston Transcript.

DORSET SHEEP AND HOLSTEIN CATTLE

Choice stock for sale. Either sex, at prices you can afford to pay. Write for particulars, stating what you want.

TRANQUILITY FARMS
ARTHUR DANKS, Mgr. Allamuchy, N. J.

HORSES

YOUR BOY

Does he love horses? Then give him a chance. Set him up in business *at home on the farm.* Loan him the small capital required to buy a good yearling draft stallion and pair of fillies. In two years his fillies should yield two colts by his stallions, and the five should mature worth $3,000 or more. The gradual development of foundation stock, the increasing number and sale of surplus colts, and the steady income from service fees would soon establish for your boy an honorable and profitable business whose normal growth under good management should make of him a useful, prosperous and happy man. Write today for further details. ADIRONDACK FARMS, 57 Maple Street, Glens Falls, N. Y.

REX O. CHURCH, R. F. D. 3, Augusta, Me.

REGISTERED HOLSTEIN YEARLING BULLS

Sired by Colonel Korndyke De Kol, one of the best sons of Pontiac Korndyke. Also 4 grandsons of the King of the Butter Kings, from choice heavy-milking dams, at popular prices. Write me what you want. Donald F. McLennan, Syracuse, New York

Buy a Bull on Easy Terms

Long Time and 4 Per Cent Interest

Holstein bull calves, sired by a SON OF KING OF THE PONTIACS, whose dam has a record of 29.57 lbs. butter in 7 days and 113.96 lbs. in 30 days, and out of A. R. O. DAMS. WRITE AT ONCE for breeding, prices, and particulars regarding our terms.
JUSTAMERE FARM, Middletown Springs, Vt.

East River Grade Holstein Cows For Sale

100 cows served to calve in August, September and October, all served to registered bulls. STRICTLY DAIRY TYPE AND GUARANTEED. 60 yearling heifers. 40 two-year old heifers all sired by pure blooded bulls from high producing dams. 10 extra well-bred registered bulls, PONTIAC BREEDING, from A. R. O. DAMS. If you are looking for extra good dairy cows, visit the EAST RIVER HOLSTEINS. Special price for the next 30 days. WE TUBERCULINE TEST. JOHN B. WEBSTER, Dept. Y, Cortland, N. Y. Bell Phone 14, F. 5.

HIGH GRADE HOLSTEINS

The best are the cheapest. Why not have that kind? We have 200 large, well bred cows that are heavy producers. Some fresh and others due within 60 days. Tuberculin tested. Come and see them.
F. P. SAUNDERS & SON, Cortland, N. Y.

Purebred Registered
HOLSTEIN CATTLE

Large sums are put into land, buildings, horses, machinery and labor in order to maintain cows that are utterly unable to return a profit.

On a dairy farm the efficiency of the herd should be the first consideration. With good purebred Holsteins you are sure to earn a generous profit on any intelligent investment of your money, time and labor.

After the cost of her feed is deducted a good Holstein will return a profit of $60 to $100 per year in addition to a valuable calf.

"A CHICKEN-MAN'S HONOR."

What Should He Do? Mark the Eggs.

MR. COSGROVE'S letter on "A Chicken Man's Honor" is interesting. His problem has been faced by most of us who sell hatching eggs. The only fair and square and sure course it seems to me is this: Mark every egg in some individual manner. Then notify your customer that you will make good every infertile egg that he returns to you. The mark must be something that a dishonest customer cannot copy, or he will send you back his own virgin eggs with your mark on them. But there are many ways of marking eggs so that nobody can fool you. W. E. KEYES.
Massachusetts.

Infertile Eggs Returned.

IN passing opinion on your article "A Chicken Man's Honor," page 790, you state "None hatched; all infertile." If the eggs were infertile they should not have been incubated longer than seven or eight days and returned to seller. The seller cannot guarantee any hatch, all he can do is to guarantee the fertility which he should do. He is certainly responsible for the eggs until they reach the customer and no matter how the loss, should there be any, should make it right. He should make a statement that eggs not fertile should be returned before 10 days (he can put some small mark of recognition on shell). He then has evidence of the state eggs reached customer if they are returned to him, at least in most cases it would be so, but how can a man be responsible for eggs that are put in an ice box or an oven or anything else that does no better for 20 days and do not hatch. FRED CARTER.
New York.

Duplicate the Eggs.

LET me suggest to Geo. A. Cosgrove that the fair thing to do with a customer who complains of a bad hatch, is that you stand ready to duplicate every egg returned to you, transportation prepaid. Any honest customer will be glad to pay the express both ways if you are willing to make good every bad egg. That is to say, if the hatch comes perilously near being a complete failure.
Vermont. J. H. LIVINGSTON.

Make Good and Say Nothing.

I THINK I am well qualified to answer this from both sides. I have shipped this season some 20,000 eggs for hatching to about 1,000 customers, and have had complaint of every egg infertile when I know positively that the eggs left my place highly fertile, as we are hatching from every mating the season through in a mammoth incubator, and know every week just how the eggs from every mating are running as to fertility and hatchability.

My practise is to duplicate the shipment without query, as I prefer to retain the customer's good will even if my eggs were not at fault. So many things can happen to fertile eggs after they leave my hands that the customer may be right; the eggs appear infertile to him and I hope by duplication to keep the customer for the future and also to do my part in seeing that he gets something for his money. Of course there are a few who deliberately swindle and ask for a duplicate setting when they had good results from the first, but I figure that such cases are so few as not to cut any figure in the year's business. I have investigated several complaints of every egg infertile and invariably found that the customer was a novice, and had set the eggs under a hen in the regular henhouse in the nest where she was accustomed to lay, and no wonder the eggs did not hatch. I have told the customer what the trouble was and how to get a good hatch, and to prove my statement have made him a present of a second setting, and invariably have received a good testimonial as the result.

From the buyer's side I occasionally purchase eggs for hatching, and at this moment have hens sitting on eggs that have cost me $10, $15 and $30 per setting respectively. I certainly expect to get my money's worth out of the investment, and if I do not get a 50 per cent. hatch from each setting I shall make complaint, as my customers make to me when they do not get a fair hatch. I sell hatching eggs to my customers expecting them to get a two-thirds hatch or better, and when they don't get it I invite them to let me know. I invariably make good to them with additional eggs. I calculate on a certain percentage of such claims every season. F. M. PRESCOTT.
New Jersey.

A Buyer's Experience.

I AM keeping S. C. White Leghorns, but my little boy wanted a few chicks "different from mother's," so I sent for 30 Mottled Ancona eggs for him. When the eggs arrived I was not pleased with them; they were not uniform in size, color or shape. However, I placed them in the incubator with some of my own eggs. At the first test (five days) 15 tested out infertile. At second (15 days) only six were left in the incubator and even these failed to hatch, so my little boy, to his great disappointment, did not get a single chick. It could not have been the fault of the incubator as my own eggs hatched 70 per cent. We wrote to the seller stating these facts, and he had not even the courtesy or business sense to answer our letter.

I offer a plan which I think is a solution, although perhaps older and wiser breeders than I may say it is not feasible. It is this: Every breeder should stamp with a small indelible stamp his name and address (or name only) on every egg he sends out for hatching, enclosing with them a card stating he will replace infertile eggs only if returned to him. Should a customer claim that the eggs are all "infertile," he must ship them back to the seller, who should pay all transportation charges if the eggs are as stated. In this way the seller can test the eggs himself and make sure the buyer has not mistaken (?) dead germs for infertile eggs. This seems to me to be fair to both sides. If the buyer should be so unfortunate as to get "all infertile" eggs, it would be very little trouble for him to replace the eggs in the case they were sent out in and ship back to the seller on the sixth day. The seller would, or should, be perfectly willing to replace such eggs and not have the uncomfortable feeling that he probably has been cheated. Of course everyone expects a certain percentage of infertility, differing according to the earliness or lateness of the season. EDITH GRATIAS.
Pennsylvania.

A TALK ABOUT BOSTON MILK.

A FEW truths spoken by Dr. Blodgett of Boston before the Medical Association a short time since are well worth noting. Pure milk, fresh and promptly delivered, is what the consumer wants; it should be and usually is what the middleman or contractor wishes to handle; it also should be and often is what the farmer wishes to produce. The farmer ought to understand that the consumer has a right to demand pure milk at a reasonable price which would properly pay the producer for his pains and trouble in producing this article under good conditions, which will satisfy the user. As the consumer loses confidence in the quality of his milk supply, his consumption decreases. Thus the farmer's business is injured as a whole by dirty milk from a few. The non-increase of milk consumption during the past five years, according to growth of population, is largely due to people's loss of confidence in the milk supply.

This loss of confidence has been caused by stories that milk four days old is delivered in Boston, also that milk from diseased cows and in some cases filthy barns is delivered, and also stories of epidemics due to use of milk from improper sources or where proper care and precautions were not used. For some of these complaints the farmers have been responsible, for others the contractor has been responsible, for still others mere rumor or some so-called investigation has been responsible. I believe I am safe in saying that if by some miracle, everybody in this city should suddenly become sure of receiving pure milk not over 24 hours old, the consumption of milk would increase enormously.

I believe the farmer who produces dirty milk or knows where such milk is produced and does not report the same, is hurting his own business, and also the business of others. Also the contractor who does not see that his milk is properly handled and promptly delivered, is injuring his own business and that of others. So important are these facts that certain associations of producers have been formed, and no producer can belong whose product does not come up to the required standard of purity. It is believed this policy will win back the confidence of consumers and increased demand for this product will follow.

The farmer's position is this: He is in most cases paid an inadequate price to produce first-class milk. His living depends on this product; he has too often found he gets the same price for a poor product as a good one; that is, no premium for improved quality. Every six months a dispute arises as to price to be paid for the coming six months. This lasts perhaps a month before he knows what he will get, a price below cost of producing a reasonable product. What can he do? In many cases all his property is the cows and equipment for milk production, no cash capital to try other lines, so he worries along for six months or more hoping conditions will change and price be better. Under these conditions, who can blame him for producing as cheap a product as possible? Can you blame him for not seeing the justice of some inspector's demand for improvement in conditions? At present less than one per cent. of the milk sold in Boston is a certified product. The rest is just milk, some produced under sanitary conditions, some not, all mixed together in many cases and sold as milk.

There seems nothing is gained by the farmer who produces a first-class article, except the self satisfaction that he is doing right; he generally receives no other reward. Under these conditions a man's conscience must be superior to the ordinary man's if he continues trying to supply a good article when his neighbor gets just as much for supplying a poor one. Further, the conscientious man is the more likely of the two to discontinue business and try something else, which does not improve the percentage in favor of the better supply; it works the other way. Almost any other commodity in the world is sold on its merits, different grades, different prices. Milk is sold mostly as one grade yet it varies greatly. In the city today you receive some of one man's, to-morrow some others, or two or three mixed as it happens, you do not receive your supply right along from the same dairy, unless in exceptional cases, yet at the month's end you pay the same price for all and the grade of supply may have varied greatly. Many producers do not know how to produce clean milk economically. Also, few physicians, boards of health or even bacteriologists, know as much about practical production of milk as many farmers do. Can the farmer be blamed for not obeying many of the foolish rules issued by this class? As the rule fault is found, but no practical suggestions are offered to remedy it.

The State inspector says unless some plan is found to encourage production in nearby New England territory, the present policy of extending the distance for obtaining the necessary amount must continue, and no improvement of supply is likely to result from the extension policy. There should be three grades of milk sold in Boston: First, pasteurized or cooked milk, which is perfectly good for cooking, can be used for drinking, and is sold frankly as milk not suitable to be used when raw, but which is rendered harmless by cooking. Second should come the great bulk of milk costing one cent per quart more and produced on a plan similar to Dr. Worth's idea of a central sterilization plant. Third, certified milk of high fat content, to be sold at extra price. The policy of financial encouragement for a good product instead of price and other punishment for a poor product, should be the policy to improve conditions and product. There has been over $100,000 spent on inspection each year in this State. Use half or more of this for premiums to producers who improve and supply a higher quality and the results would be more satisfactory. Some small dealers are now using auto trucks to collect milk and pay up to 10 cents per can extra for good quality fresh milk, and sell the same in two classes, a good quality at nine cents per quart, the other guaranteed to be not over 24 hours old at 10 cents per quart. The demand for the latter sometimes exceeds the supply.

Most producers are glad to adopt an innovation if a good reason is shown for doing so, or an increased price is the reward. There always will be some milk produced not fit to use in raw state, such must be properly treated before selling. The proposal put forth by some to sterilize all the milk supply is foolish, as that which can be safely sold as raw milk should be as this is much more beneficial to digestion than the cooked milk, as the latter process kills the bacteria which are beneficial and an aid to digestion as well as the kinds that are harmful.
A. E. P.

THE pupils in an Alabama school were asked to construct a sentence containing the word "amphibious." Quick as a flash the son of a local preacher gave the following: "Most fish stories am fibious."—Woman's Journal.

The Powerful Smalley Cuts Silo-Filling Cost!

The day of the old slat-apron silo filler is gone. No wise farmer is going to use one when he can get a money-saving, grip-hook, force-feed SMALLEY, that does the work quicker, easier and at less cost. It handles silage, cow peas or alfalfa in a hurry. Cuts it fine and uniform. Packs silage tighter—gives more tonnage.

No Power Waste

One pulley and chain-drive on blower outfits replace power-wasting idlers.

1914 Carrier

A 5 H. P. Engine will run a No. 12 force-feed and our 1914 enclosed carrier. Special alfalfa grinding screen furnished extra, protected by screen patent No. 721,246. Make your own meal.

Send postal today for latest Smalley catalog.

The Henyard.

THE EGG-LAYING CONTEST.

Just 100 more eggs were laid in the thirty-third week than in the thirty-second, the output for the week being 3,309. Tom Barron's White Leghorns take first place for the week with a score of 61. Twice before this pen has scored 61, the highest number yet laid. Chas. N. St. John's pen ties with the pen of Geo. A. Cosgrove for second place, each scoring 57. If this last pen had laid one more egg on the thirty-first week it would make 57 each week for five weeks in succession. This is pretty even laying.

Three pens tie for third place with scores of 55 each. They are Glenview Poultry Farm, Manor Poultry Farm, and P. G. Platt's pen from Pennsylvania. Frederick M. Peasley's pen laid 53, as did the pen from Branford Farm, Conn. All the above winning pens are White Leghorns. The prospect of the White Leghorns winning the contest is very good. The "sour milk" pen from Storrs Agricultural Station is now only 43 eggs behind Barron's White Wyandottes. The Storrs pen is one of the "experimental" pens, and is not competing for the prize; but the pen of Francis F. Lincoln is only 67 eggs behind the White Wyandottes, and stand a fair chance to come out on top. The weekly record is below:

GEO. A. COSGROVE.

Possible Limberneck.

I LOST five hens out of 170 hens in May. Their combs turned blue and necks got twisted, and next day I found the hen dead in the morning. Is there any remedy for it? E. V. A.
New York.

Your description of symptoms is not sufficiently complete to enable one to make a positive diagnosis of the disease from which your hens died, but the twisting of the neck which you mention often accompanies serious digestive troubles or possibly the eating of spoiled or putrid food of some kind. I would suggest giving any fowl which shows signs of this trouble a full dose—two teaspoonfuls or more—of castor oil and after its operation feeding the fowl upon soft, easily digested food until recovery; or death.

M. B. D.

Bumblefoot.

WHAT ails my birds? Last week I killed one cockerel similarly affected and this week another has developed the same trouble, but because it is a valuable one I wish to save it if possible. The toes begin to swell, beginning at the nail, and progressing until the whole toe is swollen and hard. It is due to parasite or is it a disease, and what is the cure? M. N. G.
Brooklyn, N. Y.

The inflammation of the toes which you describe is probably due to infection through some abrasion of the skin of the foot. If continued, it may result in abscess of the foot, or bumblefoot. Soak the affected foot for a half hour in warm water and clean it thoroughly, remove any sharp splinters or other foreign matter that may be detected, if pus has formed, open to it with a clean sharp knife. Keep the foot anointed with five per cent. carbolized vaseline after having bathed it with a solution of carbolic acid in water, one teaspoonful to ten of water. Then keep the fowl upon clean soft grass or clean soft litter which will not irritate the foot. M. B. D.

Feather-eating Hens.

MY hens are eating their feathers, they are entirely nude under the neck. I have lost three in one day. I feed cracked corn, wet oats and scratch food, oyster shell, charcoal, plenty of water. They are getting thin and do not look well. Do you think they are fit to kill for table? What do you think I ought to do? When they see a feather they seem to crave for them as they run wild after it. F. R.

Feather-eating is the result of a depraved appetite, usually the result of close confinement and an insufficient variety or improper quality of food. When fowls have contracted the habit they should be given as much liberty as possible, and if the worst offenders can be detected they should be removed from the flock. See that they do not lack for grit, supply some animal food, such as meat meal, beef scrap or skim-milk, give green stuff if their yards are bare, and look carefully about the perches and nests for red mites which may be sapping the vitality of the fowls by the irritation and loss of blood which they cause. If mites are found, clean their quarters thoroughly, whitewash the interior, paint the perches, nest boxes, etc., with kerosene to which one-fourth its bulk of crude carbolic acid has been added and see that the fowls have opportunity to take dust baths to free themselves from large body lice. The habit of feather eating would not render the fowls unfit for the table.

M. B. D.

Dysentery.

WILL you give me a remedy for dysentery in chickens? We give them clean grain of various kinds, also plenty of pure water, and the coops are cleaned every day. M. H. V.
New York.

See that the fowls do not have access to spoiled food of any kind or an opportunity to drink stagnant, impure, water. Add sulphate of iron, copperas, to their drinking water; a dram to the pint. As individual treatment, if desired, give each fowl a teaspoonful or more of castor oil and feed soft easily digested food for a time to relieve the intestinal irritation causing the watery discharges. M. B. D.

Variation in Feathers.

I HAVE a dark rich-colored male bird of the Partridge Rock variety that has small splashes of white in his cycle feathers since molting—none until after molting. Can you give the scientific reason for white appearing with new feathers? T. O. M.
Bridgeton, Ind.

This is a very frequent occurence with poultry. The same is true with feathers on the legs. I have known of a pullet that won first prize and a special as best female in the whole show to develop feathers on the legs the second year and be disqualified the second show season. These are inherited characteristics. If T. O. M. desires to use this male bird in breeding pen he should place only such females with this male as do not show any signs of white anywhere, and so hope that the solid and partridge color patterns will predominate so strongly that the offspring will not inherit this tendency to throw white the second year. There are many such changes which occur in fowls as they age. Mediterranean males are likely to show white in the face, buff colored birds fade to lighter shades as they grow older. Breed and strain characteristics as established by inheritance are responsible. A. L. C.

WHEN you write advertisers mention THE R. N.-Y. and you'll get a quick reply and a "square deal." See guarantee editorial page. : : : :

PUBLISHER'S DESK

Last May I sent Jos. Blum & Co., Chatfield, Ohio, an order for 300 day-old chicks and enclosed check for $33, payment in advance for same. A few days thereafter I received acknowledgment and advice chicks would be shipped the latter part of the month. They did not come. I telegraphed asking what I could do to help trace them from my end, as I assumed they had been sent. I have never received any communication from them in any shape or form to this date. Will you look these people up and let me know what I can do to have my money returned? C. G. W. G.
New York.

In reply to our inquiry Blum & Company wrote us a sarcastic letter intimating they would take the matter up with the subscriber direct. This they did, sending him chicks the last of June. These chicks were in very bad condition, over a hundred dying. By the end of Summer just 10 chicks survived. This is the history of this subscriber's transaction. We had a similar report some time ago, and making late shipments seems to be the record in both cases.

It is with great pleasure that I enclose check for renewal, as I consider that you have saved me more than that by your exposure of that much-advertised remedy Sanatogen, as I had it in mind to give it a trial when I read the article in your "Publisher's Desk." Also I often meet old acquaintances there, such as Geo. F. Cole of Boston, who has solicited strawberry consignments in this vicinity. Your paper is worth more than the subscription price, for that one department alone. W. R. H.
Massachusetts.

The above letter came when we were paying out expense for the investigation of some crooks, and for the defense of some libel suits. It made the burden just a bit lighter. We would not wish to be misunderstood. We are human. Possibly we have our human vanities. Anyway we confess that we like a word of praise and approval of our work or efforts; but mere praise or approval, no matter how skillfully or ardently expressed, could not induce a continuation of this work, which involves hard careful work, and much expense. Besides we would not want publicly to criticise any man, no matter how bad he may be, except as a duty. But when this correspondent and others like him remind us of the service the work is to him we have in this service abundant justification for the criticisms, and no little compensation for the work and expense.

I have read with great interest in THE R. N.-Y. concerning the system of Land Banks to handle farm mortgages in New York. Now can you tell me if anyone is doing anything in this line for New Jersey? I am an experienced farmer and desire to own a farm, but as things are now, very hard to get any kind of a mortgage. Of course I could go into a building and loan association and get all the money I want, but the great trouble of a building and loan association of New Jersey is you are compelled to pay interest and principal every month, hence this keeps a farmer continually handicapped, as every month, instead of holding on to what little I take in on a farm, and turn it back on the farm, I mean money in form of receipts, I have to put in into a building and loan association. Hence how can an aggressive young farmer ever get started? If I could borrow money at 5% and pay interest every six months that would be O. K. But to pay both principal and interest every month keeps many farmers from owning or buying a farm.
New Jersey. W. P. A.

Building and Loan Associations have prospered nowhere more than in the State of New Jersey. Heretofore like other sections, they have been largely confined to towns and cities where steady weekly or monthly income make monthly payments desirable. In New Jersey they have yet no central association or Land Bank; but this will probably come later as their success in New York and other States is demonstrated. With a Land Bank connection the local associations could easily provide for semi-annual or yearly payments, but until that convenience comes, you might overcome the difficulty by arranging to pay the first quarterly dues in advance and then make the quarterly payments regularly thereafter. The rules of the savings and loan associations are elastic enough to cover any requirement, provided the money is available and the security sufficient to cover the loan required. The Land Banks, when established will supply the funds. The borrowing member must furnish the security.

I am sending you a communication I have received from the Lexington Chocolate Co., of Brooklyn, which explains itself. This is the third of the kind I have received, but this time the stock price is cut $2 per share. I seem to be fortunate in being one of 50 to 100 who has been selected to share in their wonderful prosperity. My wife is another. I am not thinking of buying any of the stock, but, what do you think of it?
Rhode Island. W. W.

These people are sure, so they say, that they can make 50 per cent. for you on your money. Why they select only 50 or 100 persons to so favor is more than we know. We do not even know why they should select even 50 or 100 strangers to so favor. We do not even know why they should need anybody's money. If we were so dead sure of making 50 per cent. on capital, we would not let man, woman or child, friend, foe or sucker, in on our sure thing. The only thing we are sure about in the proposition is that we would never expect again to see any money put into the alluring stock; and the further fact that we will not put any money into it.

I take a good many magazines and papers, but I always find time to read everything in THE R. N.-Y. Besides the great practical good it accomplishes it has such a pleasant, cheerful, personal way about it, that when I put out my hand to take it each week it seems like shaking hands with one of my best friends. H. C. M.
Michigan.

This has been our purpose and wish. It is gratifying to know that some one has caught the spirit of the paper Some one has said that other papers have done more for agriculture but that THE R. N.-Y. does most for the farmer. Whether this is true or not it expresses our ideal. Give the farmer a fair show and he will take care of agriculture.

On March 4, 1913, I mailed a check for $11 to the White Lily Poultry Farm, Minersville, Penn., for 200 eggs for hatching. The check has been cashed, signed by Paul Landeman, proprietor. No eggs have been shipped and no attention has been paid to several letters regarding the order. If there is anything you can do to procure a return of the amount it will be greatly appreciated.
Pennsylvania. H. M. C.

We could not collect this account. Our advice was that effort or money spent to collect the account through legal methods would be time and money wasted.

We have had an unsatisfactory dealing with the Acorn Refining Company of Cleveland, Ohio, having purchased in October, 1911, something over $112 worth of cement paint, guaranteed for five years, and proof against acid and water. We had this paint applied as per directions at a cost of over $100, and in a very few months it started to peel off. We have repeatedly written the home office, and, after much correspondence, receive only evasive replies. W. A.
Massachusetts.

We have been unable to get any redress for this complainant. It is evident they intend to ignore the five-year guarantee of their paint. Their commercial rating would indicate that redress might be secured through a suit; but a resident of Massachusetts does not want to go to Ohio to prosecute a claim for $250. There is, of course, one way to avoid the annoyance; that leads to the suggestion not to use the paint.

I should long ago have enrolled in Dr. Ulman's Anti-Fake Club. Please put me down now. DR. W. C. D.
Connecticut.

It looks now as if the Anti-Fake Club was sure to be organized. We have an exceptionally strong and intelligent list of charter members, and expect to make quacks, charlatans, and general rogues take notice when we are once open for business. Publishers who conspire with fraudulent advertisers will receive their just share of attention.

Enclosed find check for $1 for one year's subscription to THE R. N.-Y. Received check May 19 for case of eggs lost by Adams Express Company on October 7, 1912—one year, seven months and twelve days. L. Q.
New York.

It is freely admitted by railroad men that their delays are usually made to tire out the complainant. They attempt to justify it on the ground that sometimes they are forced to pay unjust claims; and they want to even up so the small shipper suffers. We hope to change this custom at least where our shippers are concerned. J. J. D.

Weak Horse.

Recently I purchased what I thought a fairly good big horse, eight years old, in good condition. I could not find any fault with him when receiving him, but the next day when he walked he acted as if going to sit down. At times he seemed as though he would sink to the ground with his hind parts. I have the privilege of returning him in 15 days if unsatisfactory. Can you tell me what is the matter? He has a good strong back, has no swelling and does not flinch when trying to find the trouble. What can I do for him to get him ready for Spring work, or is it incurable?
New Jersey. W. B. R.

The horse apparently is affected with what dealers term "jig back," which is a permanent condition; but it is possible that the trouble is azoturia, due to idleness and heavy feeding. If the latter disease has been the cause of the symptoms noted the urine would be dark brown at time of the attacks and if so the horse will be likely to recover in time if steadily, but lightly worked every day and not heavily fed on oats. If the urine was not dark in color better trade the horse back to the dealer. A. S. A.

Indigestion,

I have a calf seven weeks old. He will not eat any dry feed, and no grass or green clover; eats very little salt or fresh hay. He does not seem to be well, stands and lies around all day. Tries to eat boards. It was the first calf and is very small. Can you tell me what to do for him? R. R. W. S.
New Jersey.

Give the calf two ounces of castor oil shaken up in milk and repeat the dose in 10 days if seen to be necessary. If two ounces does not purge freely give a larger dose the second time. Afterwards feed whole oats in addition to other feed.
A. S. A.

Quinsy.

About March 20 I bought a hog weighing about 300 pounds, due to farrow the 8th of April. She had 11 pigs and seemed all right. A week later she refused food, and we noticed a swelling on both sides of her neck. After a day or two there was a discharge from the nose. After three weeks she died. Upon examination we found the throat inflamed, but the liver, lungs and intestines seemed all right. I do not think it was cholera, but a number of swine in the neighborhood are sick also. N. W.
New York.

The symptoms indicate sore throat (quinsy) rather than cholera, and it is an infectious disease. The throat should have been rubbed with turpentine or kerosene and lard daily, and internally sprayed with a one per cent. solution of permanganate of potash. Chlorate of potash in 10 grain doses might have been given two or three times a day in milk or water. Clean up, disinfect and whitewash the place occupied by the sow.
A. S. A.

DE LAVAL SEPARATORS
Used exclusively by 98% of the World's Creameries

TEN YEARS AGO THERE WERE a dozen different makes of creamery or factory separators in use. Today over 98 per cent of the world's creameries use De Laval Separators exclusively.

IT MEANS A DIFFERENCE OF several thousand dollars a year whether a De Laval or some other make of separator is used in a creamery.

EXACTLY THE SAME DIFFERences exist, on a smaller scale, in the use of farm separators. Owing to the fact, however, that most farm users do not keep as accurate records as the creameryman, or test their skim-milk with the Babcock tester, they do not appreciate just what the difference between a good and a poor separator means to them in dollars and cents.

NOW, IF YOU WERE IN NEED of legal advice, you would go to a lawyer." If you were sick you would consult a doctor. If you had the toothache you would call on a dentist. Why? Because these men are all specialists in their line, and you rely upon their judgment and skill.

WHEN IT COMES TO BUYING A separator why not profit by the experience of the creameryman which qualifies him to advise you correctly? He **knows** which separator will give you the best service and be the most economical for you to buy. That's why 98 per cent of the world's creameries and milk dealers use the De Laval exclusively.

THERE CAN BE NO BETTER recommendation for the De Laval than the fact that the men who make the separation of milk a business use the De Laval to the practical exclusion of all other makes of cream separators.

Your local De Laval agent will be glad to let you try a De Laval for yourself on your own place. If you don't know the nearest De Laval agency simply write the nearest main office, as below.

The De Laval Separator Co., 165 Broadway, New York, 29 E. Madison St., Chicago

Products, Prices and Trade.

Wholesale Prices at New York,

Week Ending June 26, 1914.

MILK.

The Borden milk schedule to producers for the six months beginning with April is as follows, compared with last year. This is per 100 pounds in the 26-cent zone. For the 29 and 32-cent zones the schedule is 10 cents less for all months:

	1914	1913
April	$1.40	$1.50
May	1.15	1.25
June	1.10	1.10
July	1.25	1.35
August	1.40	1.45
September	1.50	1.55

Figuring 86 pounds to the 40-quart can the per quart price is as follows: April, 3.01 cents; May, 2.47; June, 2.36; July, 2.68; August, 3.01; September, 3.22.

Wholesale prices paid by New York dealers are running $1.41 and $1.31 for B and C. Hotels and restaurants using two to three cans per day are paying 4½ to five cents per quart.

BUTTER.

But little speculative business is noted. The price asked for grades desirable for storage is too high to make a safe risk. In lower grades there is considerable accumulation. Poor butter is harder to sell than formerly, when practically all cheap restaurants used strong butter.

Creamery, extra, lb	27	@	27½
Good to Choice	23	@	26
Lower Grades	20	@	22
State Dairy, best	25	@	25½
Common to Good	18	@	23
Factory	16	@	20
Packing Stock	15	@	17½

Elgin, Ill., butter market 27½ cents.
Philadelphia, western creamery, 27½ cents.

CHEESE.

Prices are one-eighth to one-fourth lower, business during the week being somewhat improved at the reduction.

Whole Milk, fresh, specials	14¾@		15
Average fancy	14½@		
Under grades	12½@		14¾
Daisies	15¾@		
Skims, specials	11½@		12¾
Good to choice	10¾@		11¾
Poor to fair	5	@	9½

EGGS.

Although receipts have been less, the accumulated stock has been sufficient to prevent an advance in price. Great complaints have been made about the Trunk Line Association's methods of handling egg damage claims. The Lackawanna Railroad is withdrawing from the association in this particular, and will make its own inspections and adjustments on eggs handled over its lines. Other railroads are considering the same move, with the purpose of lessening dissatisfaction with this branch of their business.

White, choice to fancy, large	25	@	27
Common to good	20	@	23
Mixed colors, best	24	@	25
Common to good	17	@	20
Western fresh, white	20	@	21
Lower grades	15	@	18

FRESH FRUITS.

The few apples remaining are selling slowly. Arrivals of Southern peaches are larger and quality much improved. Strawberries in excessive supply and prices very irregular, the proportion of fancy being small. A good many berries have dried up instead of ripening naturally, and others are very sandy from dashing rains in unmulched fields. Cherries are in surplus and lower, except on some stock shipped in strawberry quarts arriving in better condition. Supplies of currants are larger, but prices stay fairly high—10 to 13 cents wholesale. Muskmelons very plentiful and low.

Apples—Russet, bbl.	2 25	@	2 50

HOPS.

The crop outlook on the Western Coast is favorable, but growers are holding for high prices because of the poor prospect in Germany and England. A California expert figures that the State will get about $3,000,000 from the crop this year.

VEGETABLES.

Old potatoes are higher, some selling up to $3.50, but the advance has come too late to help many producers; new stock running better in quality and high. Cabbage and lettuce in surplus and lower. Peas and string beans running better in quality and in good demand. Onion trade active and prices high except on some nearby stock, which is small. The Erie Railroad, handling from one-half to three-fourths of the domestic onions sold at New York, is removing its onion market from Piers 19-20, on the New York side, to the Pavonia avenue yards in Jersey City.

GRAIN.

This country had in storage the last of June: 7,921,000 bushels of corn, 18,933,000 wheat, 7,407,000 oats, rye 492,000, and barley 1,386,000 bushels. European interests are now buying heavily of American wheat, which is the lowest in eight years. Crop conditions in Europe are not favorable, and buyers are disposed to take the bargains at present available rather than risk waiting for further declines, which may not come. Steamer space for three and one-fourth million bushels has already been engaged, and nearly two million bushels more have been sold for shipment to England and the Continent. One thing made clear by this active foreign buying is that our apparent surplus is wanted in other parts of the world, and that there is no real basis for the "75-cent wheat" which newspapers with their "immense crop" stories have prophesied.

*

The goods in bonded warehouses at the Port of New York, June 1, were valued at $62,196,139. Tobacco exceeded $25,000,000. Next came cane sugar, $4,278,000; wool manufactures, $3,373,295; and linens, $2,518,824.

*

Railroad and industrial paper maturing July 1 amounts to $114,370,000, or more than $80,000,000 in excess of last year. The largest items are the $30,000,000 note issue of Chicago Elevated, and $20,000,000 Baltimore & Ohio notes.

*

A cargo of dried beet pulp for cattle feeding, about 1,000 tons, was shipped from Almeria, in Southern Spain, to Boston the past Spring. This part of Spain formerly grew large quantities of beets for sugar, until the small mills were closed up by the large sugar interests.

*

The measurement of ships that intend to use the Panama Canal is now being done at New York and other domestic and foreign ports, having officers authorized to do this work and issue the proper certificates. Ships not thus certified will be held at the Canal while the work is done. Measuring a ship requires from one to two days for two men familiar with the work. The canal toll for vessels carrying passengers and cargo is $1.20 per 100 cubic feet of actual earning capacity.

W. W. H.

We had a wet late Spring followed by drought; have had but one shower in the last six weeks. Pastures drying up, meadows short, oats almost a failure; potatoes suffering, all berries and truck crops short and outlook discouraging. Many factories running on short time; quite a lot of unemployed men.

Blue Ash, Ohio. W. F. K.

June 16. The set of apples is worse than expected; Gravensteins badly cut, Starks decimated, and other apples cut off. Total crop may be 800,000 barrels and of this export may be 500,000 barrels. Every day the reports grow worse. Happily there is a hope that the Nova Scotian Ben Davis is badly struck from frost injury. I detest our prolific Ben.

Berwick, Nova Scotia. J. B.

Sore Neck.

My mare is afflicted with sore neck. Just as soon as she commences to work in the Spring, her neck gets sore and remains sore all Summer, or as long as she is being worked every day. It breaks out in pimples or bunches, and if the scab is picked off leaves little holes in her neck which sometimes bleed; the top of her neck cracks. I have tried healing powders, salt washes, pads, soft collars, etc., without effect. This sore neck causes her to kick while at work, and makes it very disagreeable for both of us. Could you advise a cure or preventive? T. R. K.

Ohio.

In such cases one sometimes finds patches of dead, horny skin present. These are called "sitfasts," and have to be cut out before permanent healing will take place. Twice daily wet the parts with a lotion composed of two ounces of turpentine and six ounces of extract of witch hazel. If they do well apply a little benzoated oxide of zinc ointment twice daily. It is a mistake to clip off the mane when the neck becomes sore. The short hairs are forced inward and aggravate the condition. Keep the collar clean. Adjust the draft so that the neck will not bear so much weight.

A. S. A.

Breeding an Old Mare.

Is a mare of about 14 years too old to breed? The mare is in good condition and weighs about 1,000 pounds. I believe she has had a colt, but do not know when. I am told that it might be unsafe to breed on account of age. W. G.

New York.

A mare should be bred when two or three years old and then bred yearly. While the old mare may breed she may have trouble at foaling time; but there is nothing certain about either. There is some danger in breeding the mare, but no one can predict the result. A. S. A.

HUSBAND: "Is this butter perfectly fresh?" Wife: "The dealer told me it was just from the creamatory."—Birmingham Age-Herald.

Subscribers' Exchange

Complying with several suggestions received recently, we open a department here to enable RURAL NEW-YORKER readers to supply each other's wants. If you want to buy or sell or exchange, make it known here. This Rate will be 5 Cents a word, payable in advance. The name and address must be counted as part of the advertisement. Copy must reach us not later than Friday to appear in the following week. No display type used, and only Farm Products, Help and Positions Wanted admitted. For subscribers only. Dealers, jobbers and general manufacturers' announcements not admitted here. Poultry, Eggs and other live stock advertisements will go under proper headings on other pages. Seed and Nursery advertisements will not be accepted for this column.

MAPLE COVE FARM—Products direct to Consumers. ROUTE 24, Athens, Pa.

SEVERAL CYPHERS 400-EGG INCUBATORS to sell for want of use. C. T. HAMILTON, Greenlawn, N. Y.

WANTED—Four International Hovers. State condition and lowest price. JOHN H. GASSER, Bethel, Conn.

FOR SALE—Brand new "New Way" gasoline engines; one 1½, one 2½ H. P.; half price. D. J. MASON, Lowman, N. Y.

HORSES THOROUGHLY AND CAREFULLY broken to saddle for the road or field; distance no object. L. HOWARTH, Mt. Freedom, N. J.

FOR SALE—Matched pair chestnut geldings, weight about 2,800. Also 110-acre farm, fully equipped; good sugar place, 1,100 buckets. Price reasonable. CHAS. WESTON, East Fairfield, Vermont.

TIMBER LOTS AND POULTRY FARM for sale. M. W., care R. N.-Y., 333 West 30th St., New York.

FOR SALE—$2,500 new house, on shore of Fore River; or exchange for farm. LEWIS T. HOWE, Glendale Road, North Weymouth, Mass.

FINE VILLAGE AND RIVER FARM FOR SALE—Fine house, water, fruit; good barn; keep 25 cows; 1½ miles to depot. BOX 24, Rockland, N. Y.

FOR SALE—$4,000 244-acre improved farm for stock raising or general farming; good water, healthy climate. J. F. TORRENCE, owner, Rt. 4, Louisa, Va.

FOR SALE—Choice farm of 100 acres. Another of 50 acres. Near Wolcott, N. Y.; plenty of fruit. Come and see, or write to A. H. CREQUE, Wolcott, N. Y.

FOR SALE—Two farms; one up-to-date chicken farm, 30 acres; buildings for 1,000 hens. Also a sheep and dairy farm of 150 acres. Five camp lots on Otsego Lake. K. E. WHITE, Cooperstown, N. Y.

FRUIT, TRUCK, POULTRY FARM FOR SALE—36 acres, excellent location and market; good buildings; all kinds fruit; strong soil; with or without stock, etc.; buy direct, saving commission. HOMER TWEED, Quakertown, Pa.

FOR SALE — Fruit farm; 3,500 trees—apple, peach, pear, quince, cherry; 3 acres strawberries; all tillable; 10 minutes' walk to railroad station. Price, $7,500. E. D. HUFFMAN, owner, Marshall's Creek, Monroe County, Pa.

FOR SALE—Fruit and dairy farm; 140 acres; nine-room slate roof house; running water house and barns; good sugar orchard; 600 barrels apples last year; prospect as many this year. Price $4,000, including two acres corn, 1¼ acres potatoes and garden. C. G. ADAMS, Colerain, Mass.

FOR SALE—Poultry, fruit and truck farm; 65 acres; 1,000 fruit trees; half acre strawberries; new poultry house, for 1,000 layers; fine 12-room house; large barns, etc.; running water throughout; granary, garage, etc.; would make a fine gentleman's place; 1½ miles from station. BOX 48, Mountainville, N. Y.

FOR SALE—130 acres: 110 tillable, 50 suitable for gardening; 9-room stone house, remodeled with screened porch, 12 by 50 feet; good barn; 1½ miles from two stations; two miles boating and fishing; beautiful scenery. Will be sold with 40 acres of crops and immediate possession given if desired; photographs. W. G. KANE, Kyserike, Ulster County, N. Y.

FOR SALE—Boarding house, established fifteen years; accommodates fifty guests; with 128-acre dairy farm; will keep forty cows; milk station on farm; everything in first-class shape. Price, including growing crops, $11,000. Immediate possession; easy terms; photos and particulars on application. Address WILLOW BROOK COTTAGE, Wallkill, N. Y.

FARMERS' SECURITY BUREAU, NEW YORK Agency Famous for Reliable Farm Help. No Branch. **SIDNEY SULLIVAN, Expert, 99 Nassau Street**

The FARMERS' BUREAU an agency exclusively for agricultural help. Only first class farm help and positions solicited. References investigated. Scientific advice on farm problems. Dept. R, 150 Nassau St., N. Y. Phone, 5565 Beekman

DO YOU NEED FARM HELP

We have many able-bodied young men both with and without farming experience, who wish to work on farms. If you need a good, steady, sober man, write for an order blank. Ours is a philanthropic organization and we make no charge to employer or employee. Our object is the encouragement of farming among Jews. **THE JEWISH AGRICULTURAL SOCIETY, 176 Second Avenue, New York City.**

HUMOROUS

A hen stood on the garden lot,
Whence all but her had fled,
And didn't leave a planted spot
In the early onion bed.
With vim she worked, both feet and legs,
And the gardener says he bets
She was trying to find the kind of eggs
On which the Onion sets.
—Credit Lost.

FARMER'S WIFE (to visitor): "Now, Johnny, will you go and collect the eggs, and don't take the china ones. I suppose you know what they're for?" Johnny: "Oh, yes, they're for a pattern to show them how to make the others."—Punch.

TOMMY arrived home one day with a nice new golf ball. "Look at the lost ball I found on the links, pa," he said. "But are you sure, Tommy," ask[illegible] father, "that it was a lost ball?" "[illegible]n, yes," said the boy. "I saw th[illegible] and his caddie looking for it."—[illegible]on Transcript.

"It's going to be w[illegible] the knife," declared the suburbanit[illegible] was feeding his chickens. "What [illegible]" asked the friend. "Why, Blink[illegible] me a box of axle grease and advi[illegible]e to use it on my lawn mower." [illegible]l?" "Well, I sent it back and told him to use it on his daughter's voice."—Lippincott's Magazine.

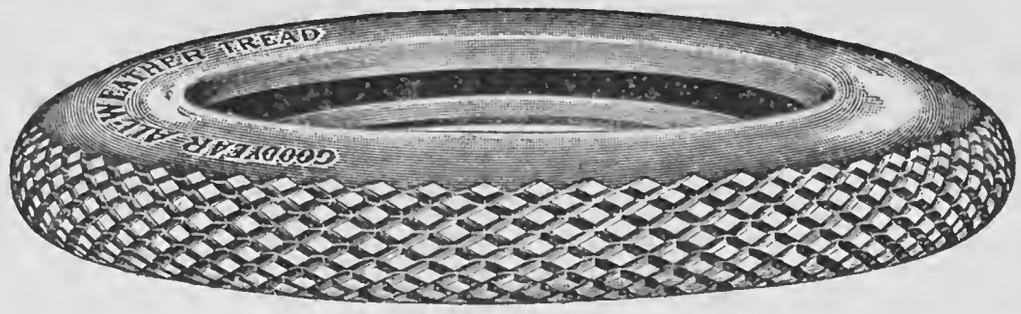
LITTLE Willie had been very naughty—so much so, in fact, that, after having reproved him several times, his mother was at last forced to severely punish him. When his father arrived home in the evening he at once perceived that Willie's eyes were suspiciously red. "What's the matter, sonny?" he cried. "Oh, nothing," responded Willie uncastly. "Come, don't be frightened," said the father, in coaxing tones. "Tell me all about it; I want to know." Willie remained silent for some time, then he suddenly burst out: "Well, if you must know, I've had a thundering row with your wife."—Pearson's Weekly.

AN English artist, while sketching in the Alps one day, was searching for a suitable background of dark pines for a picture he had planned. Finally, he found just the scene he was seeking, and best of all, there happened to be a pretty detail—the figure of an old woman in the foreground. The artist asked the old lady to remain seated until he made a sketch of her. She consented, but in a few minutes asked how long he would be. "Only about fifteen minutes," he replied. Three or four minutes later the old lady, with manifest anxiety in her voice, asked if he would be much longer. "Oh, no, only a very few minutes now," again the artist replied. "But why do you ask so anxiously?" "Oh, it's nothing," she answered, sadly, "only I'm sittin' on an ant-hill."—Woman's Journal.

A LAWYER for a railway company once had to defend his employers from the charge of negligence in the case of a farmer whose cart was demolished at a grade crossing. The accident happened at night, and the principal witness was an old colored man who was on guard armed with a lantern to signal the approach of trains. "Now, John," said the lawyer, "did you swing your lantern when you saw the cart coming?" "Yassir, I sut'nly did, suh, I done swing dat lantern right crost de road." On the strength of this testimony the lawyer won his case. He took occasion to thank the witness. "Much obleeged to yo', Marse Torm," replied that worthy. "I'se pow'ful glad I could he'p yo'. But I was plumb frightened dat other lawyer gwin ax me ef dat lantern was lit."—Credit Lost.

These Costly Tires

Now Undersell Nearly Every Make



The tables are turned. Goodyear No-Rim-Cut tires—once the costly tires—now sell below most others. There are 16 makes sold at higher prices—up to one-half higher.

Now these tires which rule Tiredom—the leading tires of the world—save you on first cost as well as on last cost. It is more important than ever to get them.

Reasons for Cost

No-Rim-Cut tires for a long time cost one-fifth more than other standard tires. That was due to four great features—costly features—found in no other tire.

They ended rim-cutting by a method we control. It has saved tire users millions.

They saved blow-outs—all the blow-outs due to wrinkled fabric. They did this through our "On-Air" cure—an extra process which costs us $1,500 per day.

They reduced loose tread danger by 60 per cent through a patent method.

Our All-Weather tread gave to users a tough, double-thick anti-skid. A flat tread, as smooth as a plain tread, but grasping wet roads with deep, sharp, resistless grips.

No other tire at any price has ever offered these four features.

Reasons for Price

The reasons for present Goodyear prices are just these:

New factories, new equipment, new machinery, new efficiency. A multiplied output, now the largest in the world. It has cut overhead cost 24 per cent and labor cost 25 per cent.

A modest profit. Last year our profit averaged only 6½ per cent.

No-Rim-Cut tires at present prices are even better than they were at high prices. They excel other tires just as far, and in just as many ways.

Up to now men bought these tires because of their hidden economies. They bought millions of them because of their known mileage records.

Now you have in addition this visible economy—this saving which comes at the start. You have a price from $5 to $15 lower than many other tires.

Any dealer will supply you Goodyear tires at Goodyear prices. If he is out, he will get them from our nearest branch.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. LXXIII, No. 4263. NEW YORK, JULY 11, 1914. WEEKLY $1.00 PER YEAR.

BEES A-SWARMIN'.

Make Them Feel At Home.

IF you are watching out along in June when the flowers are in full bloom and the bees under the old apple tree are finding their Winter quarters crowded, so that the "old folks" are thinking seriously of hunting up a new flat and leaving the youngsters in possession of the old home, you may hear and see a commotion in the air about the hives that will warn you to be on hand lest your tenants arise and depart without your knowledge. Very likely scouts have been spying out the land for some days and when the Calebs and Joshuas of the hive return with reports of bounteous fields of bloom on the far-away hills and convenient hollow trees in neighboring woods, trunks are packed, good-byes are said and only a pleasant morning, with no threat of rain, is awaited for a general exodus to a new home where another family may be reared and the bee population assured of its proper increase.

But, if you are watching, the new swarm, which is really an old swarm, for it is the old queen with enough of her faithful retainers to establish her in a new kingdom, may usually be seen to alight in some nearby tree or shrub before finally quitting the scene of their old activities. And now is the time to secure them, for if they again take wing they may go miles before alighting and someone else may hive them, for the law of custom is that a stray swarm belongs to its captor.

If you are forehanded, and of course you are, you have already set an empty hive fitted up with frames and foundation, or clean old combs, in some convenient place, and your bee gloves, hat and veil are at hand where no time need be lost in getting into them. If you are an old timer, or a bit inclined to be vain of your fearlessness, you may dispense with these protectors; but don't, it is never safe and sometimes disastrous. Be thankful if the swarm has settled upon a shrub or low-hanging branch where it may be reached from the ground or a step-ladder; but if it hasn't, get a ladder and saw, or a basket, unless you have a swarm-catching device mounted upon a pole, and climbing to the bees, gently shake them into the basket held underneath, or saw off the limb upon which they are clustered and carry them to the empty hive where they may be dumped or shaken upon a cloth that has previously been spread before it.

The bees seem at once to recognize that here is a new home such as they started out to seek, and without the loss of a moment, they begin to pour into the entrance. If, in your awkwardness or timidity, you have not failed to secure the queen, they will probably stay, but a little artificial rain made with the aid of water bucket and dipper will tend to quench any wanderlust that they still possess and insure their remaining till night, after which they are not apt to leave. A spray of water thrown into the tree in which they are clustered will also help to hold them until their new quarters can be made ready or help secured. Bees are not inclined to wander in the face of what seems to them an approaching storm.

If you have not secured the queen, however, your work has been in vain, for as soon as the bees discover her absence out they will go in search of her. She may have dropped into the grass or be hidden in a small cluster of bees still in the tree. Wherever she is, if not disabled, the bees will find her and again cluster about her to give you probably another opportunity to secure the swarm. Now you will be less nervous, for you have discovered that swarming bees, each with its load of provisions for the new home, are not at all inclined to sting. You will be more careful to secure practically all the bees, including the queen, and unless their proposed home is in some way distasteful to them, you may count upon their ratifying your choice and settling down to housekeeping again. M. B. DEAN.

THE "UNEARNED INCREMENT" OF THE BEES. FIG. 370.

R. N.-Y.—Swarming bees seem a mystery to those unacquainted with their habits, and in past generations many quaint superstitions were connected with them. The custom of telling family news of birth, death or marriage to the bees, lest they desert their hive, still persists in some parts of England.

DECORATING THE CODLING MOTH.

FOR fully a week I had been trying to get at the job of spraying 40 Duchess apple trees. Being a business man in the city, and living on four acres just outside the city, I am not always able to get at my work on the four acres just at the proper time, but things shaped themselves so that Saturday (Decoration Day) found me with about 100 gallons of spray material prepared, two pounds arsenate of lead to 50 gallons of water. My spraying outfit consists of a small gasoline engine mounted on a three-wheeled triangular frame, one of the angles of the frame supporting a small barrel holding about 25 gallons of solution, the suction pipe and overflow or return pipe leading into this barrel, while the discharge pipe is about 25 feet of good tubing. The little engine gives a pressure of about 140 pounds, the whole outfit being drawn from one point to another by myself, as the spraying proceeds. It makes good, lively work from the moment the engine starts, and I fancy if a man kept at it, say 10 hours a day, he would not need to be rocked to sleep at night; but for a city man, and on such a day as Saturday, after a gentle rain on the previous afternoon, with the sun shining warm and bright, with a very gentle wind from the northwest, I do not ask for any better fun than the job of thoroughly spraying these 43 trees in just two hours and 30 minutes, actual time, which includes the time of drawing the outfit from tree to tree, or I should say from *four* trees to the next four trees, as I can nicely surround four trees with the spraying outfit located at a central point between them. Will some of you old spray men tell me whether this is good time or not for *one* man on 43 17-to-18-year Duchess apple trees? The question came to my mind after I had finished the job. I do not know how much time such a job should take, but I do know the trees were well sprayed, and that I used over 80 gallons of spray material, and that I did not loaf on the job after the little engine began snorting. J. B. B.

FACTS ABOUT HARDY CATALPA.

MANY parts of the Eastern States have been overrun by agents trying to sell trees of hardy Catalpa (Catalpa speciosa) for farm planting. They can tell large stories about what this Catalpa tree will do on the river bottom lands of the Central West, and they try to apply this experience to the thinner and unsuitable lands of the Eastern States. Here are the facts about it:

Because the hardy Catalpa is a specialized farm crop requiring good, heavy soil and a certain amount of care, it is not adapted for general farm planting. It is native to the rich bottom lands along the Wabash and other rivers in the Middle West, where it often reaches large size. However, it must have good, rich, fairly well-drained soil and there are few if any farms in the Eastern States the owners of which are willing to devote good soil to the growing of trees. Foresters are opposed to the use of agricultural soils for forestry purposes. Every rod of land in the Eastern States which is suited to agriculture should be in agricultural crops. There are, however, in nearly every farm in the East from one to 10 acres of land which is really non-agricultural and which should be covered with trees. However, this non-agricultural land as a rule is not fitted to the growing of hardy Catalpa, and anyone who plants the Catalpa upon poor ridge or hill or in swampy land may expect failure.

The hardy Catalpa is a very rapid grower when planted in good soil and the wood is durable in contact with soil. It is really a post and pole tree only, and here in the East is not a tree which will produce saw logs. If a land owner is willing to devote an acre of good land to the Catalpa, planting one-year seedlings about 6x6 feet each way and then cultivating the plantation two or three times during the first two seasons of growth, it will grow rapidly and produce fence posts in from eight to twelve years. However, the tree is not a straight grower and unless some attention is given to the pruning and care of the trees, they will show a tendency to the formation of a crooked trunk. Black or Yellow locust, which is a rapid grower and the wood of which is very durable, may be put in the same class as the hardy Catalpa. It is a good post tree, but it is so liable to be injured by a flat-headed boring insect that it is as a rule not a profitable tree to plant.

Creosote is now being used so generally for the prevention of decay of ties, posts and farm timbers generally that it will be better to put rapid growing evergreens onto hill or ridge lands, and then apply a coat or two of creosote with a brush or boil the lower 40 inches of the posts produced from evergreens in a simple open tank for a few hours. While posts from rapid growing evergreens are not very strong, as a rule, strength is not required in fence posts. There are a number of broad-leaved trees such as the White ash, basswood or linden, tulip or whitewood and the Red oak and others which are fairly rapid growing, and which are not liable to be injured by insects and the timber from which is very valuable. The ash especially is going to be valuable, because it is taking the place of hickory in the manufacture of automobiles and other vehicles. HUGH P. BAKER,

State College of Forestry.

FERTILIZER AND GRASS EXPERIMENTS.

UNDER the direction of the Jefferson County Farm Bureau several demonstrations have been made in the past two years with a home-mixed chemical fertilizer used as a top-dressing on old meadows. This year the practice has been widely extended with most gratifying results so far. It is thought that in many instances the hay yield will be doubled, and these evidences were not wanting before the recent rains appeared. F. E. Robertson, manager of the Farm Bureau, is highly pleased with the results achieved.

TWO DIFFERENT "STRAINS" OF TIMOTHY GRASS. SOME YIELDED TWICE AS MUCH AS OTHERS. Fig. 371.

Last year M. W. Casse gave the fertilizer a trial, using 200 pounds of nitrate of soda, 100 pounds of acid rock phosphate and 50 pounds of muriate of potash, sowing about 300 pounds on an acre of three-year-old meadow where the grass had nearly succumbed for want of plant food. This field of grass was cut last July in the presence of Mr. Robertson and several farmers, and from weighings made from fertilized and unfertilized plots it was found that the fertilized plots more than doubled the yield. This year Mr. Casse has increased the area brought under the stimulus of the home-mixed fertilizer, and has not only sown the mixture on his meadows, but also on a field of grain. Others who have noted an increased yield from the use of the fertilizer include Joseph Allen, Frank Arnold, Charles Powell, Gilbert Shannon, Andrew Fults, George Cross, A. W. Danforth, and William Plato.

FIELD STONES FOR BUILDING.

IN reply to C. W. B., on page 833, in regard to building from common field stone, will say that by getting the right kind of mason a very good, substantial and nice-appearing wall can be built. With these stones a much cheaper and certainly just as strong wall may be constructed as with concrete. Of course much depends on the size and shape of the stones and the man who is handling them. The wall supporting my barn contains about 70 cubic yards of stone and sand, and was laid up at a cost of about $90 for masons, mason tender and cement. Of course this does not include hauling of stone, cement or sand. I selected my stone and consequently have a very substantial as well as beautiful wall. However, this stone all came off the farm. I do not think it advisable to build a house or barn complete with stone for such a building is sure to be damp. With common selected field stone, such as found in Southern New York in large quantities, especially those that can be broken once or more, thereby getting a sharp and freshly broken surface, same to be laid "out," a very beautiful house porch or outside fireplace chimney can be constructed, and at a less cost than wood, and surely more substantial. However, the laying of stone is an art, but with a mason who understands such work a pleasing and attractive job may be had. Stones in this section (Tioga Co., N. Y.) are of a flat nature, and it is easy to get them and by selecting from these stones and breaking the larger ones as well as the chunky ones, thus getting fresh surface, a nice wall may be constructed.

In selecting stone care should be taken to get as near uniform thickness as possible. Farther East and in Southern New England, stones are more rounded in form, and even with these a mason who understands handling them can do wonders with them. Waterbury, Conn., contains many fine half basements and porches and even half stories constructed with these "round" stones. In that section the stones are about the shape of a foot-ball, only larger, and at first, to one in these parts it would seem impossible to make a wall of them, but seeing is believing and Waterbury certainly has many very beautiful porches and bungalows constructed from such stone. If one has his own team and plenty of stone at not too long a haul, a porch or any kind of a wall can be built cheaper than of concrete or any other material. F. J. HICKEY.

New York.

IS THE POULTRY BUSINESS DOOMED?

FROM looking over your paper every week, I have gained the impression that you still encourage poultry raising, and I must say I am more than astonished, as I thought your paper was a paper that had a conscience. You certainly ought to know that, with the duty removed, the "heathen Chinee" will very shortly make poultry raising a very expensive pastime in this country. I am told that eggs are purchased in China at six cents a dozen, and are landed in this country at something like 10 cents a dozen, all charges paid. True, I know that a concern in Spokane, or was it Seattle, was obliged to send a large number of crates of China eggs to the city crematory, but still, that would hardly happen again, and so I cannot see what American poultry raisers can do but give up. Honestly, what is there to this Chinese egg scare? The papers here were full of it, and I am told that if China doesn't ruin the business for us, Europe will. I have planned to spend about $1,000, more or less, in increasing my little plant this year, but if there is really any serious menace, I would naturally prefer to keep my money in the bank. Will you tell me what you know of the matter? A. E. B.

Virginia.

If you understand the poultry business and have the patience and courage to become a genuine hen man our advice is to stay in the business and develop your plant. If you do not know much about it, and are frightened by ghosts and shadows, you will be better off to put your money in the bank and keep it there.

There are people who profess to be frightened because the tariff has been removed from imported eggs. We do not share their fears. The Department of Agriculture reports that prices for farm eggs ruled a little higher this year than last. If you consider eggs as you would other farm products, the outlook never was better. Prices of meats have gone steadily up and we now know that the meat shortage is world-wide. The first and most available substitutes for meat are poultry and eggs. These will be used more and more as supplies of beef and mutton fall. This has been true in every country where the meat supplies have run short, and the future is sure to see a greatly increased demand for the hen and her fruit.

Eggs from China have for a considerable time been received in commercial quantities on the Pacific Coast, and some have got as far East as St. Louis. There is no probability that that the egg business in this country will be killed by supplies from either China or Europe. No doubt certain localities most accessible to imports will be affected, but such things are constantly happening in industrial and agricultural life, both here and in other countries. Even though eggs may be cheap in foreign countries, the risk of damage by long distance water shipment is great—not only breakage but destruction of the body of the egg by shaking in hard storms. When eggs reach a large market they have to be sold on the basis of appearance under the candle, and the average of damage through several years is likely to discourage importers. In any event the imported egg will not compete with the "fresh laid" or breakfast egg.

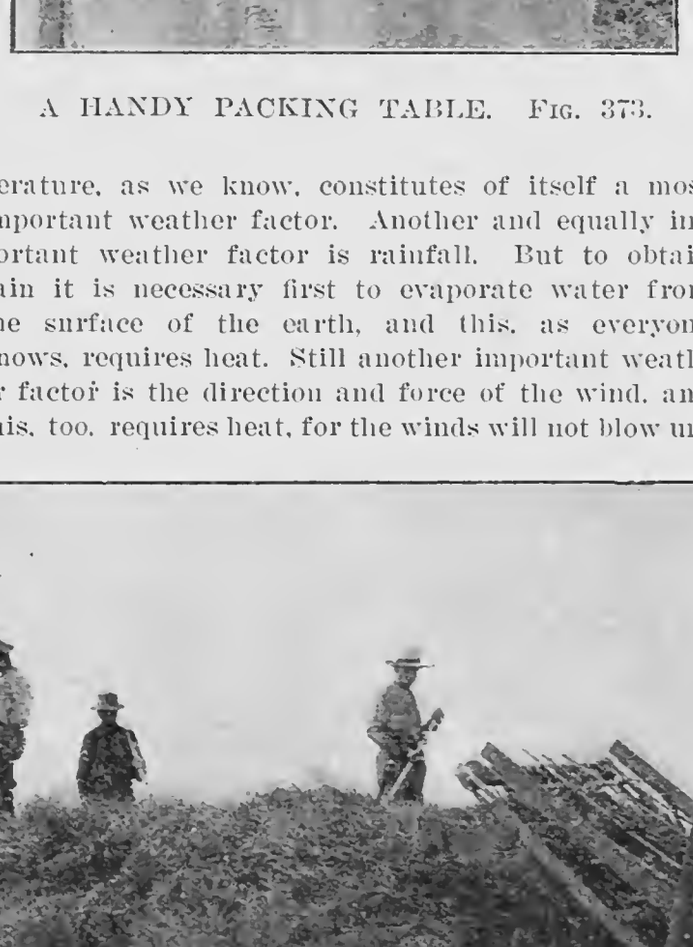
SCIENTIFIC PRODUCTION OF FINE APPLES.

From Plowing to Packing.

PART III.

GRADING TABLES AND GRADING.—There are two forms of grading or packing tables in more or less general use, namely, the horizontal and the sloping. The former consists of a canvas or burlap-covered wooden frame about four feet wide and six to eight feet long. In most cases the different grades are selected by persons standing along the sides, placed in baskets and emptied directly into the barrels. This form of grading possibly offers the least opportunity for injury to the fruit, but in general will not take care of as many bushels in a given time under the present general standards for grading barrel apples as is possible with the sloping table. The latter should have the same dimensions as the horizontal table, is elevated at one end, has six to eight-inch side and end walls, either a solid or slatted bottom, which should be padded, and a 10 to 12-inch opening at the lower end, through which the fruit passes to the barrel. It should be high enough so that a barrel will set under the lower end opposite the opening, with five to six inches to spare. The fruit is generally lowered into the barrel by means of a strip of burlap, which is fastened to the table and held across the open end of the barrel. With the table properly padded, and care in lowering the fruit into the barrel, this equipment will give very practical results. This table may be modified, as is shown at H of Fig. 362, page 882, so that both first and second grades can be barreled directly therefrom. A place is also provided for the "facers," which may be selected as grading proceeds.

GRADING.—Notwithstanding the urgent need of improvement in the standards of grading, the greater bulk of barreled apples are sorted into but two grades. For standard varieties like Baldwin, Greening and Spy, No. 1 or firsts, should include no fruit under 2½ inches in diameter; and No. 2, or seconds, no fruit under 2¼ inches in diameter. Exceptions to the above are found in the case of Romanite and varieties of similar size and shape where 2¼ inches is usually recognized as the minimum diameter for No. 1. A further exception sometimes occurs with varieties which have many specimens running over three inches in diameter, in which case a third or "fancy" grade might be made of all fruit over three inches. In any case, however, none of these grades should contain fruit which is infested by insects or fungus disease, or which bears any form of injury which would impair the keeping quality or general appearance. In addition, any specimens of No. 1 size which are very poorly colored or are especially ill-shaped, should go as No. 2, provided, of course, they are otherwise sound. All fruit which does not come up to the above standards should be sent to the canning factory, made into cider or fed to live stock. A sizing board should be used until the graders have the sizes of the different grades well in mind. Any thin board about five inches wide and two to three feet in length in which round holes of the proper size have been made, will answer the purpose. A further guide may be provided by keeping specimens of the proper size constantly before the graders.



A HANDY PACKING TABLE. FIG. 373.

THE HAY LOADER IN OPERATION. FIG. 374.

INCREASING EXACTNESS.—In case a grower has a special trade for strictly fancy barrel apples, grading to more exact uniformity in size and color will prove profitable. We are of the opinion, however, that the increasing demand for more exactness in the grading of all kinds of agricultural products will make such a practice imperative before many years. Recent legislation in the form of the so-called "Sulzer Bill" has laid down certain rules for the standardizing of barreled apples. All growers who sell apples in barrels should become familiar with this law even though they do not wish to sell their fruit under "United States standards." Copies of the bill may be secured from the Secretary of Agriculture, Washington, D. C., or from Senators or Representatives in Congress. R. H. BELL.

THE MOON AND WEATHER CHANGES.

EVERY season we have many letters from people who have been told that the moon has some direct influence upon crops or upon the weather. The Agricultural Department has now taken this matter up and gives the following opinion:

"As a matter of fact all weather changes depend ultimately upon temperature differences. The temperature, as we know, constitutes of itself a most important weather factor. Another and equally important weather factor is rainfall. But to obtain rain it is necessary first to evaporate water from the surface of the earth, and this, as everyone knows, requires heat. Still another important weather factor is the direction and force of the wind, and this, too, requires heat, for the winds will not blow unless the temperature is different at one place from what it is at another any more than the air will draw up a chimney when there is no fire in it.

"Since then the heating of different parts of the earth and its atmosphere to different temperatures is the real cause of the winds and of all weather changes it follows that the moon and the planets can affect the weather only so far as they supply heat.

"Now, according to accurate measurements made with the most delicate instruments, the amount of heat sent to the earth by all the planets and also by the moon is insignificant in comparison to the amount that comes from the sun. Hence we could not expect either the planets or the moon appreciably to affect the weather. They do not supply enough heat, the one thing that causes all our weather changes.

"To most people the above reasoning may seem quite sufficient and conclusive, but there is still another and an entirely different method of testing the whole question. We can observe the positions of the planets and the kind of weather during each position and see whether the same sort of weather always comes when the planets are in the same position. This kind of examination has often been made, both for the planets and for the moon, but not the slightest influence of either upon our weather has ever been found. To sum up: We have every reason to believe that neither the planets nor the moon can have any appreciable effect on the weather, because they furnish so little heat upon which all weather changes ultimately depend, and this belief is fully supported by weather records. The belief, still to be found in all countries, that the planets and the moon do affect the weather never had any scientific basis whatever; it is only a remnant of the many superstitions generated and fostered by that other and greater superstition, astrology."

COVER CROPS IN VIRGINIA.

I HAVE just read the article on page 812, entitled "Why Not Cover Crops?" and for the encouragement of T. W. K. and others will give a little experience to show what we may do with vetch and clover in Southern Virginia. We bought this farm January 1, 1912, at which time it was as badly run down as shiftless tenants could run it. In the Spring of 1912 a field of gray loam, underlaid with red clay, was lightly manured with stable manure; 300 pounds bone meal per acre applied broadcast, and corn planted. Crimson clover was sown at last working of corn in August. Corn made 40 bushels per acre, of shelled corn. Spring of 1913 clover was plowed down when about two feet high; 300 pounds per acre of 16 per cent acid phosphate was applied and corn planted again. One of the driest season on record ensued, and only 45 bushels of corn per acre was harvested. Crimson clover, Virginia gray oats and vetch were sown at last cultivation of corn, in August. May 30, when the vetch was in full bloom and the bloom just falling off the oats, it was cut for hay, and four two-horse loads of fine hay per acre was secured. The oats were not strong enough to hold up the vetch, and in consequence much of it was run over by the mower on account of being sprawled out so flat on the ground. I think close to one-third of the vetch was left on the ground.

Our county demonstration agent, D. D. Sizer, visited this field shortly before it was mowed, and we straightened up a number of vetch vines that were six feet or more in length. I also have vetch and rye growing in a young orchard in red clay land which has never received any manure and no fertilizer except an application of 300 pounds per acre of bone meal in the Spring of 1912, which is nearly as heavy as that described above. The first-mentioned field was plowed as soon as the hay was removed and again planted to corn, with an application of 400 pounds per acre of 16 per cent acid phosphate, and I see no reason why a bumper yield should not result. I believe the roots and part of this vetch crop which was too flat on the ground to be caught by the mower are equal to an application of manure. The soil was literally filled with the root nodules of the vetch.

JOHN B. LEWIS.

Brunswick County, Va.

The Home Acre.

NOTES FROM A MARYLAND GARDEN.

YEARS ago there was always a gap in the supply of sweet potatoes, but now, thanks to our curing houses, we have sweet potatoes all the year round. Now, the last of June, the sweet potatoes from last year's crop are retailing for 20 cents a peck, as the crop last year was unusually large and many have been kept over. Sweet potatoes of the Southern yam class are getting more popular every year. The most popular of these is the Nancy Hall, a potato with the pumpkin-colored flesh, like the Pumpkin yam of the South. When the Northern people learn to bake sweet potatoes instead of steaming or boiling them they will learn the greater sweetness of the soft southern sorts over the dry Jersey kinds. Of course growers have to cater to the demands of their market and hence the Big Stem Jersey is grown for northern shipment. There is a potato known in the Baltimore market as yam, but not a true member of the Southern yam family. This is the Hayman, or as some call it the Southern Queen. This potato was brought from Brazil many years ago to Virginia, and was renamed years ago by a Northern seedsman Southern Queen and sent out under that name. The original name of Hayman was from the name of the sea captain who brought it to this country. This is one of the earliest sweet potatoes. It is not of the best quality in the Fall and early Winter, but in late Spring and Summer its quality is very good, and we are eating them now with much pleasure. Its great fault is the tendency to grow too large, and hence it should be planted rather late. It is the easiest to keep of any sweet potato.

There is a sweet potato now much talked about in the South called the Early Triumph. I have never grown it, but those who have claim that it is simply the Nancy Hall renamed. The popular potato on the Raleigh, N. C., market is the White Barbados. This is a potato of the old Spanish type and a true representative of the Southern yam varieties. Baked in an oven the sugary sap will break through the skin, and it makes a delectable morsel. When I was a boy, in the old fireplace times, I thought that there was nothing finer than to put the old Spanish potatoes in ashes on the hearth and cover them with hot coals. A potato of this class baked in the ashes was something far ahead of the dry yellow Jerseys. If the Northern people ever learn how to cook the Southern varieties they will learn their superior sweetness, but the Southern soft potatoes will not abide the steaming or boiling that Northern people use in the cooking of sweet potatoes. It takes the dry Jerseys to stand that sort of treatment. In fact sweet potatoes of any sort are at their best only when roasted or baked.

Our first sweet corn was pulled June 26. This was from the variety called the Portland Market, the seed of which were sent me by an Oregon seedsman. Whether actually grown in Oregon I cannot of course say, but the variety is about as early as any I have ever grown. My standard early corn has been for years the Norfolk Market, an improved variety of the old Adams Early, but this Oregon corn, planted later than the Norfolk, has come in ahead of it.

Notwithstanding the intense drought, the Yellow Potato onions made a fine crop, and are now cured and housed. I plant these in September and after the Early green onions from sets of the Norfolk Queen have been used, we use the offsets from the potato onions as green onions.

Cucumbers also are on hand (June 27); our market growers have been shipping them for a week, and the price is said to be good. The great cantaloupe crop of this section will soon be on. This crop is later than usual owing to the long continued dry weather, but the melons are said to be forming finely.

My early peas were a complete failure, burnt up, but I have had a great surprise in the success of a later sort called Sharpe's Queen. This has withstood the dry heat, and has given us a fair crop of very fine and sweet peas, and here the last of June the vines are still green and making new bloom, something I never saw in peas in this hot soil and climate.

Crosby's Egyptian beets are unusually good this season. I must have struck a greatly improved strain, for a more perfect and early growth with small tops I have never seen. I have tried a number of varieties of the chard, some with pink leaf stalks and some with yellow, and two years ago I had a variety that grew so large that people thought it was rhubarb, but the leaf stalks were flat and thin and not good. Then I got the Lucullus. This variety makes leaves of a light yellowish green, and crumpled like Savoy spinach, and the stalks are round and long. We are now eating the young leaves of the thinnings and find them the best of all Summer substitutes for spinach. Later, when the leaf stalks are well developed we shall cook these like asparagus, and they make a fine dish. The Lucullus is certainly the best of the chards.

The John Baer tomato, which was advertised to make ripe fruit in 30 days after setting, has been out 60 days and has not yet made a ripe fruit, though well loaded with green fruit. The fruit seems to be uniformly very smooth, and one should not judge too hastily about its earliness this season of intense drought and heat, for we have not had rain enough more than to moisten the soil an inch or more since the first week in May; a little below the surface the soil is dust dry, and one wonders how plants live at all that are not watered heavily. The Brimmer, a late tomato, has fruit as large as the John Baer, and one of my neighbors has ripe Earlianas, though I have not.

W. F. MASSEY.

Maryland.

SOME HAYING NOTES.

THE picture at Fig. 374, page 903, shows a typical haying scene in the Middle West. Most of our readers can remember the time when all the hay was forked laboriously on the load by hand. Every pound of it had to be raised by the small of the back both in putting it on the wagon and in taking it off again. Many of our people, it is true, do the same thing now, but in a larger proportion of machinery comes to take the place of much of the old hand labor. As is shown in the picture the hay loader on many a farm takes the place of the fork. This machine runs behind the load, catches up the grass with its steel fingers and plays baseball with the bunches in a most effective way. The modern outfit, with a heavy team, can now drive into a field when the grass is ready and with fast walking horses gather up a load of this hay as rapidly as two men can well take care of it.

In many cases it is taken up so clean that it is not even necessary to go over the field with a rake. There are still many farms on which the hay-loader is not used. Some of them are too small and others are too rough or stony for the use of such improved machinery. On the smooth larger farms, however, this device is of great service and the scene pictured at Fig. 374 is a familiar one on many of our farms.

At this season of haying several old questions always come up for discussion. One is whether after a storage barn is filled with hay the building should be left open or closed in order to dry out the "sweat" which arises from the new hay. Some farmers believe that the doors should be left open in order to let in the air and thus cool and dry off the hay, while others declare that the doors and windows should be shut tight, with only a ventilator left at the top. We have heard some hot remarks over this question but the best authorities agree that it is better to close the barn after the hay is put in in order to get rid of the moisture. As the hay heats, vapor arises from it to the top of the barn. If the door is left open the cooler air from the outside and especially at night will be likely to condense the vapor into moisture to remain at the top of the hay. If the barn is closed this vapor will pass off at the top through the ventilators, and thus dry out the hay sooner than if the barn was left open.

Another question which frequently comes up at this time regards the use of salt in putting away damp or green hay, if it has been necessary to house the hay in advance of a storm or for some other reason hay not fully cured must be put into the house. With clover or Alfalfa hay there is danger in this from overheating or even spontaneous combustion, and farmers often use salt scattered over the hay as it is put in. There are several reasons for the use of salt under such conditions. The salt will absorb considerable moisture, and when scattered over the hay will draw water and to a large extent lessen the danger from fermentation. In another way the salt prevents trouble because of its chemical action in delaying or preventing certain ferments which might otherwise go on in the hay. The use of lime is also recommended for this purpose, and we have known farmers who scattered charcoal over green hay as it was put into the mow. Salt is the material generally used, and has been employed when the hay is not fully cured.

BOSTON MARKETS

Fruits and vegetables in Boston market have been fairly plentiful and reasonable in price as the rule. Strawberries are coming in very freely on account of hot, dry weather; quality is good, but size not as good as many wish in all cases; a few of these to fancy trade bring 40c. per box wholesale; good berries go at about 25c. per box, while other grades range from 8c. to 15c. per box, according to condition of fruit when it reaches the market. Pineapples, which have been plenty all Spring, are now short on account of drought in Florida, it is said; $3 to $4.50 per crate are the prices on these. Bananas and oranges are plenty and cheap for the season, the former selling at $1.25 to $3.25 for yellow, and up to $4.50 per bunch for reds, while the latter go at $2.50 to $3.50 per box. Southern watermelons 25c. to 40c. each and in fairly good supply. Cantaloupe about $2 per large crate. Blueberries coming in and sell at 13 to 15 cents per box; gooseberries about 10c. per box; currants about the same; raspberries 10c. per pint. A few Baldwin apples left go at $3.50 per box; Western fruit $3.50 and $4.

Onions and potatoes short and high; Texas stock about $4.50 per crate, Spanish $7.50, Southern sets $4.25 per basket. A few Maine potatoes left, bring $2.30 per bag at cars; new Southern $4.50 per barrel. Sweets from Carolina $4.50 per crate. Asparagus plenty and demand a little slow, yet prices are fair. Jersey and Pennsylvania stock $2.50 per dozen; native $3 and $4 per box. Southern string beans $2 per basket; Southern cabbage $1.50 per barrel. Cucumbers cheaper at $2 to $3.50 per box; lettuce 30 to 60 cents per 18 heads; bunch beets 50c. per dozen bunches; carrots 50c. to 75c.; white turnips 50c. to 75c.; yellow turnips $2.25 per box. Rhubarb 1½c. per pound; new green peas quite plenty at $1.75 to $2 for best per box; others around $1.50. Spinach about 40c.

Butter coming in very freely and prices breaking slightly. Prices range from 26c. to 32c. The same story applies to cheese, which brings 14½c. to 18½c., according to quality. Eggs coming in quite plenty, but demand is good, and prices incline up instead of down; 24c. to 32c. per dozen are the figures for different grades.

Live hens go at 16c. and broiler chickens 25c. Dressed poultry 15c. to 20c., according to size and quality; broilers 28c. to 30c. for native, while Western stock go 27c. Nice veal 15c. per pound; other grades 14c., 13c., 11c. and 9c. Best lamb 18c.; good 15c. and 16c. At Brighton dressed hogs 11c.; live weight 8½c.; live veals about 8c.; live steers about 8c.; good cows 6½c.; others 5c., 4c. and 3½c. Milch cows plenty but demand light; common milkers about $50 each.

General grain prices are lower at wholesale, but local dealers keep prices at high level of the past few weeks. Mixed feed goes at $28 and $29 per ton; bran $24; cotton-seed meal $33; gluten $30; cornmeal, per bag, $1.53; oats 36c. to 47c. per bushel.

Hay is firmer and inclined upward on account of poor promise of present year's crop; $22 and $23 per ton is easy to obtain for good horse hay; other grades $15 to $20 per ton. Dry weather has spoiled hay crop on any but low, moist fields or fresh seed land of good moisture-holding quality. Many have cut early fields that were drying up and turning yellow. Apple crop promises fair at present time; other fruit about medium or light.

ALFALFA

AMERICAN NORTHERN GROWN

Guaranteed to be 99% pure and free from dodder. *Write for sample on which we invite you to get Government tests.* We do not handle Turkestan "Dwarf Alfalfa" or cheap inferior European seed. We offer only the very best. Our seed should produce hay at $60 per acre annually. Can usually furnish Kansas, Nebraska, Montana or Dakota and Grimm Seed at very moderate prices.

CLOVER and GRASSES

Northern grown and of strongest vitality. We can furnish grass mixture suitable for any soils.

WING SEED CO., Box 223 Mechanicsburg, O.

ALFALFA

Now is the time to get ready to sow alfalfa. July and August good months. Get our book, Alfalfa, The Wender Crop, Free. Full information on how to successfully grow alfalfa. How to prepare the ground, protect and harvest. Earn 7% net on $1,000 an acre. Also tells about "NITRAGIN," the famous inoculator. Write today.
Galloway Bros.-Bowman Co., 275 Galloway Station, Waterloo Iowa

SWEET CLOVER SEED—Pure white and biennial yellow. Prices and circular how to grow it, sent on request. E. Barton, Box 29, Falmouth, Ky.

VEGETABLE PLANTS

CAULIFLOWER, CELERY, CABBAGE PLANTS. Leading Varieties. Large or Small Lots. Mail or Express. Catalogue Free. HARRY L. SQUIRES, Remsenburg, N. Y.

CABBAGE PLANTS—I have over One Million Plants ready to plant out. DANISH BALL HEAD, FLAT DUTCH, ALL SEASON, ALL HEAD SAVOY, and others—$1 per 1,000; $8.50 for 10,000. CELERY PLANTS—all leading kinds, $1 per 1,000. CAULIFLOWER PLANTS—$2.50 per 1,000. J. C. SCHMIDT - - Bristol, Pa.

STRAWBERRY PLANTS

For JULY, AUGUST, SEPTEMBER Planting. Runner and Pot-grown Plants. Also Raspberry and Blackberry Plants. All Leading Varieties. Catalogue Free. HARRY L. SQUIRES, REMSENBURG, N. Y.

Cabbage Plants—100,000 Late Cabbage Plants. All the leading varieties at 90c. per 1,000. Special Prices on large orders. DAVID RODWAY, Hartly, Del.

PLANTS—SWEET POTATO, $1.50 per 1,000—CAULIFLOWER, $2 per 1,000. CABBAGE, $1 per 1,000 List free. W. S. FORD & SON, Hartly, Delaware

FRUIT TREES

All Leading Varieties at Less Than Half Agents' Prices. Catalogue Free. Harry L. Squires, Remsenburg, N. Y.

Apple Barrels—Car lots or less. Prompt shipment. ROBERT GILLIES, Medina, N. Y.

COVER CROP QUESTIONS.

Value of Crimson Clover.

DOES it pay to sow Crimson clover for cover crop if it freezes out, or has no time to grow in Spring before plowing? Should I sow rye and clover in my corn if I want to plow early for potatoes? E. H.
Maryland.

Yes, we should sow Crimson clover in your latitude whether it was thrown out during the Winter or not. Our experience is that after 60 days of growth the clover will more than pay for the labor and seed, even though it is completely killed during the Winter. In your latitude there should be four months of growing season at least during the Fall, and you would gain a good profit on a growth of clover seed before Winter set in.

Preventing Soil Acidity.

HOW keep land from getting sour or acid? Some argue plowing green cover crops down should not be done for this reason. Would it be better to cut cover crop and dry it before turning under? Is this practical? E. H.

Any soil which contains a fair quantity of organic matter will become sour more or less slowly, and the use of lime at fair intervals is the best treatment for such soils. We know of a number of cases where farmers cut the cover crop with a mowing machine and let it dry into hay before plowing it under. This prevents some of the trouble from souring, but it is not the best way to handle these crops. We think that the process of fermentation which these green crops go through in the soil is of benefit, and we consider it more practical and cheaper in the end to plow the green crops directly under and pack the soil firmly and use lime frequently enough to prevent the soil from becoming too sour.

Fitting Land for Wheat.

I HAVE several acres of oats. I shall plow it as soon as grain is harvested to seed to wheat in Fall. Should the land lie idle in hot Summer to settle, or would it be better to sow to buckwheat and Cow-horn turnips to get more humus in soil? Would plowing down this crop a week or two before seeding injure wheat crop? E. H.

Personally we would not let that land stand idle. As soon as possible after harvesting the oats we should plow or harrow this land and seed to the buckwheat and turnips, and plow this crop under before fitting the ground for wheat. We think the humus added to the soil in this way would more than pay the cost of the plowing and seeding, and leave the soil in better shape for the wheat than if it were left idle through the Summer. It would be an economy to use a dressing of lime or limestone. Before putting in the wheat, we should plow this cover crop under and then roll or pack down firmly. Then harrow the upper soil as carefully as possible and make a good seed bed for the wheat.

Two Methods of Strawberry Culture.

MANY different systems and ideas of the same exist in different sections where strawberries are grown. The Massachusetts Fruit Growers held a field meeting June 17 at Mr. Gardner's place on the Marshfield hills, and two entirely different systems side by side are practiced right there. Mr. Gardner, having about 10 acres of beds on his place, including bearing beds and those set for next year's crops, uses one system, while his neighbor just below growing about four acres uses another. I believe both are very practical, good common sense systems, and will briefly go over them.

Mr. Gardner as the rule plants potatoes this year on the land he intends to set strawberries on next year, and uses a heavy dressing of stable manure and one ton of high-grade fertilizer per acre on this crop. The following Spring one-half ton of fertilizer is put on the land and the strawberry plants set. Necessary cultivation of course follows, and in the Fall Mr. Gardner takes his first crop off in the form of pot-grown plants which are sold in wholesale lots to the seedsmen, largely in Boston. The first and strongest runners are all used for this purpose, and the later runners are trained into matted rows of about three feet in width, perhaps more. A narrow path separates this from the next bed. These runners are not allowed to grow too thick in the beds, being placed so the sun can get at the berries. Under this system he gets two crops, one of plants and the other of berries. By this system he sacrifices his berries to a certain extent for the pot plants, but as these are his leader, and the berries a second consideration, the system works out in his case all right. He grows good berries, but of course not as good as he could from the first runners were they used to crop from. He fertilizes his bearing beds by using one ton per acre of special strawberry fertilizer put broadcast over the mulch early in the Spring, often during a late snowfall or early Spring rain.

The neighbor grows for berries only, and sets his plants in early Spring in rather narrow rows and trains the runners as he wishes them to grow. After these are well rooted he takes out the mother plants entirely, leaving a narrow path about the width of a hoe blade here. This leaves the beds in narrow rows of 12 to 20 inches in width, which are very handy to pick, without too much arm stretching. Every other path is used by the picker and is made wide enough to move in comfortably and pick from the beds on both sides. The plants in the beds are spaced about right to let in plenty of light to ripen up the berries properly. This man does not aim to grow too large a berry, believing the medium-sized berry that grows naturally without too much forcing stands up better after reaching the market, and also holds its place better, and his customers in Boston back him up in these claims. He grows Marshall only, and gets a bearing season of three to four weeks.

Now comes the exceptional part of the story. This man has about four acres of land, and has grown only strawberries on this for about 18 years, and uses nothing but commercial fertilizer, no stable manure, and less than one ton per acre as the rule, worked in between the rows a short time before the crop is ready to pick. This year's bed of two acres is plowed in after picking is over, to gather with the mulch between the rows, and this is the only fertilization beside the commercial fertilizer used the next year on the crop that the land received. The following Spring the new crop of plants is set. A mighty good crop of good berries of even size is being picked this year, and these beds of two acres of level or slightly sloping land on a high elevation are a sight worth seeing, and will long linger in memory. Strawberries are the main crop, in fact about the only crop grown in that section, and the growers are experts in their line. Pickers are mostly Portuguese men and large boys, who are paid by the day in many cases, the wages being $1.75 per day. Two cents per box is paid for box picking.
Massachusetts. A. E. P.

MAIL BAG.

Arsenic on Grass.

IS it safe to cut grass covered with arsenate of lead? The town sprayed the elms, also my grass for a considerable distance in, as the wind was quite strong and did not improve it.
Massachusetts. J. W. B.

Generally speaking and with ordinary spraying, such grass could safely be made into hay. It seems that in this case more spray than usual was used, and there would be a question about it. We would send a fair sample of the grass to the experiment station at Amherst and obtain a scientific opinion. No one could be sure without examining such grass.

Mixing Chemicals With Lime.

I HAVE a piece of land sown to buckwheat to plow under. Would it be all right when sowing lime to mix nitrate of soda, dried blood, potash and phosphoric acid with lime, and sow all with lime spreader? Which is better, hydrated lime or ground rock, for mixing this? O. H. C.
New York.

No, we would not mix fertilizer with lime or ground limestone. Better put the lime on alone and harrow in well, and then apply the chemicals separately.

Exploding Dynamite With Battery.

G. H. S., page 832, inquires regarding gas engine battery to fire dynamite. We have done it many times, and have never had a miss, using four dry cells without the spark coil being in the circuit. If a number of holes are to be fired at one charge, we have connected the caps parallel and also added several extra batteries, four being sufficient for one or two charges. An easy method of determining just how many charges a given number of cells will fire, is to connect as many plain caps together parallel as you wish to fire, and add till you get results. ELMER J. WEAVER.
Pennsylvania.

What Became of the Middleman?

I HAVE just read with great interest "Why Boys Leave the Farm," page 810. Mr. Green said some very good things in his article. Before I was through with my chores this morning I concluded to ask a question of you or your readers.

About that middleman, what are you going to do with him after he is eliminated? Or do you not care what becomes of him? True, the farmer being one of those who produce all that is desirable and good for man should get more out of that "35-cent dollar." But my heart goes out to that poor fellow called the middleman (I have been one of them). Now if he has only a small capital and pays rent, which he usually does, he has no easy row to hoe, it being on the contrary a long one and rocky. But to the question, what are you going to do with the middleman, after he has been compelled to move on? Will some of your readers answer this question? Or perhaps Mr. Green will, if not, call on your humble servant and he will try. I am interested in the boys myself, as I have several of them.
Washington. B. D. SWARTWOOD.

Recent Experiment Station Bulletins.

"ATTIC Dust and Treasures," issued as Bulletin No. 7 in the Rural Life Series from the College of Agriculture at Ithaca, N. Y., is an appeal to farmers' wives to search for and preserve valuable historical material in the way of papers or objects that may have been tucked away in old attics and be in danger of destruction at the annual house cleanings. Its illustrations and descriptions are interesting, and suggestive of other treasures which intelligent search might bring to light.

"Porto Rican Bee Keeping," which may be obtained as Bulletin No. 15 from the Superintendent of Documents, Government Printing Office, Washington, D. C., will interest those bee keepers who sometimes long for green fields far away. It is a description of the industry in Porto Rico by the superintendent in charge of the bee culture investigations of the U. S. Department of Agriculture.

"The Tennessee Wooden Hoop Silo," is the title of Bulletin No. 105 from the University of Tennessee at Knoxville. It illustrates and describes the construction of what is said to be the cheapest and one of the most satisfactory types of home made silos; costing from $60 to $100 according to size and quality of material used.

"Some Diseases of Nursery Stock," Circular 35, from the New Jersey Experiment Station at New Brunswick, describes, with excellent illustrations, some of the common fruit tree diseases, such as crown gall, hairy root, fire blight, apple and pear scab, peach yellows, little peach, etc. Circular 34 from the same Station is devoted to crown gall and hairy root alone. Grain smuts, their cause and treatment, are discussed in Circular 36.

The San José scale, Oyster-shell bark louse and Scurfy bark louse in Ohio are treated of in Circular No. 143 from the Agricultural Experiment Station at Wooster. Maps showing their distribution in the State are given and the recognized remedial measures are described. Circular No. 140 from the same station discusses Orchard bark beetles and pinhole borers, while Circular No. 142 is devoted to the Seventeen-year locust.

"Forage Crops" is the title of Bulletin 269 from the Ohio Station and "Forest Conditions in Ohio" are described in Bulletin 254. Both are profusely illustrated and may be obtained by addressing the Experiment Station at Wooster, O.

Orchardists will be interested in the third report of "A Comparison of Tillage and Sod Mulch in an Apple Orchard" from the Experiment Station at Geneva, N. Y. This report by Prof. U. P. Hedrick embodies a vigorous condemnation of sod in apple orchards.

Other bulletins from the same station are "The Cabbage Maggot"; No. 382; "A Test of Commercial Fertilizers for Grapes," No. 381; and "Analyses of Materials Sold as Insecticides and Fungicides," No. 384. M. B. D.

Save $4 to $8 per Acre
Seed and Fodder

On Clover, Alfalfa, Flax, Vetch, Peas, Timothy, short grain, etc. A rake or tedder will knock off and waste the seed and leaves. You save all that waste by equipping your mower with the

THORNBURGH
Side-Delivery
BUNCHER AND WINDROWER

Easily attached to ANY Mower

Deposits crop to side, out of way of mower and team on next round. Leaves crop in either loose, hollow bunches or in windrows; heads and leaves in center, stems, which hold the sap, sticking out to dry quick.
Saves the seed and leaves and half the labor. Saves making extra trips over the field with dump-rake, side-delivery rake and tedder.
Cures Quicker—No Bleaching—Costs Little and Pays for Itself Every Day Used.

The New GREENWOOD LIME and FERTILIZER DISTRIBUTER

TOP FEED—NO RUSTING—NO CLOGGING
Accurate indicator for 100 to 3,500 lbs. per acre, whether material be wet, dry, sticky, lumpy, heavy or light. Write for booklet R to
GREENWOOD MFG. CO., Lawrence, Mass.

Each ply of Webco Weartex roofing is 10 pounds heavier than the corresponding ply of any other roofing.

HEAVIER ROOFING Wears Longer

Webco Weartex Roofing is thicker than any other roofing made---more soft wool felt is used---it absorbs more asphalt. This makes it wear at least 10% longer than any other roofing of a corresponding ply—irrespective of cost and nature of construction.

That is an unqualified guarantee—we back it up to the limit. Yet Webco Weartex Roofing costs less than other high-grade roofing because we sell direct and save all middlemen profits: Thousands buy direct from our factory and

SAVE 30 TO 50%

We make roofing of all grades for all purposes—for farm homes, barns, outbuildings, bungalows and cottages. Prices range from 95c up to $3.00 per Roll and "absolute satisfaction or money back" is the guarantee that goes with every roll.
We choose our own raw materials and manufacture every roll of roofing to give service. We are sure of the quality and by doing an enormous business direct with our customers, we are able to sell at one small profit.

FREE Send for this valuable Roofing Catalog today. It tells how we make our different roofings and how you can buy direct from our factory and make every dollar do double duty by saving the dealer's profit. Every page is full of facts that you should know. Send now and read it before you make another move toward roofing your building.

EVENTS OF THE WEEK.

DOMESTIC.—Fire at Salem, Mass., June 25, swept over half the city, rendering 20,000 people homeless. At least six lives were lost, and the property loss is estimated at nearly $15,000,000. The burned area covered about two square miles. The fire, which started in the plant of the Karn Leather Company, was apparently caused by an explosion. The city was immediately put under martial law by Governor Walsh, food and tents being furnished by the State. Among historic buildings destroyed was the birthplace of Nathaniel Hawthorne, but the House of the Seven Gables escaped.

Heat, tornadoes and lightning descended upon various localities in the Middle West June 26, and claimed several lives. The storms resulted from the intense heat wave. Lightning started approximately fifty fires and killed one man at Aurora, Ill., and another at South Bend, Ind. A tornado swept through Wausau, Wis., and destroyed considerable property and killed two men. A cloudburst cut loose a dam and reservoir at Lanesboro, Minn., and flooded that town of 1,000 inhabitants.

The 30-acre plant of the Richardson & Boynton Company, manufacturers of stoves and ranges, at Dover, N. J., excepting the shipping department building, was destroyed by fire, supposedly of incendiary origin June 28. The loss is $500,000. Eleven hundred men were employed there before the works were shut down, temporarily, three weeks ago, on account of the heat and for repairs.

The Anchor Line steamship California, from New York for Glasgow by way of Londonderry, with 840 passengers aboard, went aground in a dense fog June 28 on the rocks of Tory Island, off the northwest coast of Ireland. The California's bow was badly damaged when she struck the rocks, but all on board were taken off in safety.

Stringent measures to prevent bubonic plague following the reports of one death and another case in New Orleans were admitted by Surgeon-General Blue on June 29. Two experts from the Department of Health were ordered to the afflicted city, and telegrams were sent to public health officials in every State bordering on the Atlantic and Gulf coasts and those fronting on the Mississippi River detailing preventive measures. Every port from New York to Galveston and up the Mississippi to St. Louis is to be urged to begin immediately a campaign of extermination against rats. Every ship from southern ports will be scrupulously examined by health officials at all ports to learn if possible the origin of the disease. All steamers, whether starting for coast, foreign or Mississippi River ports, will be thoroughly fumigated and then protected with rat guards. All freight, whether leaving New Orleans by steamer or rail, that a rat might hide in will be held up unless fumigated. In this way it is hoped to prevent the spread of the plague, which with the exception of a single case in California recently, has not been found in a human in the United States since the epidemic in cattle six years ago.

After an uninterrupted service of sixty years the United States Express Company retired June 30 from the transportation business, the close of its fiscal year, in accordance with the plan adopted last March. All the railroad contracts had been transferred to the other big express companies, and arrangements have been completed whereby Wells, Fargo & Co. will act as agents for the United States Express Company in carrying out the contract with the Government for the handling of money.

FARM AND GARDEN.—More than 1,500 farmers, their families and employes from all parts of Lake and Porter counties, Ind., were the guests of the city of Gary, the steel corporation, and the Gary Commercial Club, June 27. This was the annual farmers' day celebration, which is a movement to encourage farmers to trade in Gary and to bring their produce to the public market. Most of the visitors came in automobiles. On their arrival in the city they were addressed at the Commercial Club by Mayor Johnson. Following this the men marched to the Illinois steel works, where a special train of observation cars took them through the coke ovens, steel mills, tinplate plants and bridge plants. Meanwhile the women and children attended a concert at the Presbyterian Church and at Jefferson Park. At noon the visitors dined without cost in the hotels and restaurants of the city. In the afternoon a public reception was held for them at the Commercial Club, followed by a free concert, automobile ride, inspection of local stores and an exhibition drill by the fire department at night. The visitors received tickets that admitted them to any theater and "movie" theater in Gary.

Amendments to the regulations for the protection of migratory birds have been proposed by the United States Department of Agriculture to take effect as soon as the three months notice required by law has expired. This will be on October 1, 1914. Meantime copies of the regulations can be obtained from the biological survey of the Department. The effect of one of these changes is to permit on the Missouri and the upper waters of the Mississippi the shooting of all migratory game birds for which there is an open season from October 1, 1914, to January 1, 1915. After the latter date the prohibition will be in force again. The new regulations provide for a closed season in Zone No. 1 for all water fowl from December 1 to September 30, 1915. Exceptions to this rule are: In Massachusetts and Rhode Island the closed season shall be between January 1 and October 1; in Connecticut, New York, Pennsylvania, Idaho, Oregon and Washington between January 16 and October 1; in New Jersey between February 1 and November 1; in Minnesota, North Dakota, South Dakota and Wisconsin between December 1 and September 7. For Zone No. 2 the closed season is between January 16 and October 1, with the following exceptions: In Delaware, Maryland, the District of Columbia, Virginia, North Carolina, Alabama, Mississippi and Louisiana the closed season shall be between February 1 and November 1; in Florida, Georgia and South Carolina between February 16 and November 20; in Kansas, Missouri and Oklahoma between February 1 and September 15; in Texas, Arizona and California between February 1 and October 1.

CROP REPORTS.

June 30.—Splendid rains lately, bringing crops along nicely. Hay will be about half a crop; old meadows are quite poor. Alfalfa is quite good; not much grown here. Potatoes come up slowly on account of dry, cool weather. Corn of all kinds rather backward for this time of year, but looks quite healthy. Oats have good healthy appearance. Buckwheat nearly all sown. Potatoes all sold.
Elk Creek, N. Y. V. S. C.

June 27.—Prices on nearly all farm produce here are variable, and are a matter of quality, supply, and the person selling. Corn, native, is selling at 75 to 80 cents per bushel; oats 40 to 50; hay $12 to $15 per ton for baled native wild. Butter ranges from 20 to 35; milk 20 to 40 cents per gallon; eggs 15 to 20 cents per dozen. Young chickens, frying size, 30 to 40 cents each. Cows, fresh, sell at anywhere from $20 to $65 each. G. W. M.
Jackson, Miss.

My strawberries were ruined by the drought. Where I got 100 quarts a day last year (same patch), we did not sell a berry; just had enough for home use. Same with red raspberries. Sweet corn knee high and tasseling out and will not make seed. Farmers have no hay or pasture. We are feeding stock just as we do in January. Best wheat crop in years and farmers busy threshing; grain good quality. Gladiolus will not pay expense of planting and cultivation; have 10,000 bulbs to plant for late cutting, that ought to go out now, but can do nothing toward getting the ground in order, and they could not come up if planting for lack of moisture. E. T. F.
Belleville, Ill.

June 30.—The pastures through this section are in good condition, and with the amount of rain we have been having I think they will be in good condition for some time. Of course the drought we had last Summer hurt all our pastures, and we must not expect to have as good feed in them as we would had we had a better season last year. The market price for butter is lower this year than it has been for several years, and I understand that our creamery here is losing money even at the price, and at the price of feed there is no money in it for the farmer. Jerseys are mostly kept in this neighborhood; there are a few black and white, but not many, and most of our farmers are interested in keeping a purebred bull to build up their herds. You may be interested to know that we have about 375 head of purebred Jerseys here. We have sold 50 head since the first of January. We keep all our stock in the barn daytimes, and pasture them nights. We find with this practice we get more milk from our cows, and our young stock grows much better.
Delaware Co., N. Y. P. A. DUTTON.

June 22. The condition of crops in Jefferson Co., Nebr., is good, due of course to ample rainfall and generally favorable weather. A large crop of Alfalfa was cut the first week in June, much of which was more or less damaged by rain. The second cutting is now nearly ready, and will be heavy. Wheat is now about ready for harvesting, and will be in full swing this week. The crop is large but has been damaged to some extent by Hessian fly over the territory south of the Platte River from the Missouri River west 200 miles. The damage in this county is estimated at 10 per cent. Notwithstanding this, Nebraska is slated for the largest crop of wheat in her history. Oats too are very fine, but will not be ready for cutting this month. Corn was never in better condition at the time than now, but it has to run the risk of shortage of rain during July and August, which may come and may not. Prices of horses and mules continue good. Butcher cattle six cents live weight; hogs $7.50 per hundred; butter 15; eggs 15; wheat 75; corn 80; shipped in potatoes (old) $1.25; new potatoes just showing up and 50 cents a peck.
Fairbury, Nebr. H. M. R.

June 25. This is mostly a dairying section, making market milk for New York City. This month, June, the Bordens are paying a flat contract price of $1 per 100 pounds of milk, with a 10-cent per 100 pounds premium for a score of 68 or better, also an extra 10 cents per 100 pounds for milk testing 3.8 or better. The dairymen are dissatisfied with these prices, and I think I am safe in saying that there are not more than one half as many milch cows in this section as there were three years ago. Buyers are coming in here from the West and cleaning the country of cattle. Good young cows sell for from $75 to $100; young stock cannot be bought, as they are very few and the farmers are holding them. The Spring was very backward this season, but we have had fine weather lately and the farmers have nearly caught up with their work. There is a large acreage of Telephone peas in this country. The soil seems to be adopted to growing peas, but they are a very uncertain crop to raise, as we get anywhere from 25 cents to $2.50 per bushel, with the bulk selling from 50 to 75 cents. We were very much interested in the articles regarding late sowing of Telephone peas, and from my own experience can say that all who discussed this are right. We have had late sown peas grow and keep bearing till frost killed them and again we have had the blue mold and lice destroy the whole crop. We put in our last sowing of peas yesterday, the 24th of June. M. W. F.
Burlington, N. Y.

COMING FARMERS' MEETINGS.

Summer meeting, Virginia State Horticultural Society, Charlottesville, Va., July 15.

Summer meeting, New Jersey State Horticultural Society, farm of J. H. Barclay, Cranbury, N. J., July 15.

Summer School of Agricultural and Country Life, Massachusetts Agricultural College, Amherst, June 30–July 28.

Annual Poultrymen's convention, Massachusetts Agricultural College, Amherst, July 22–24.

Georgia State Horticultural Society, Summer meeting, Griffin, Ga., August 5–6.

International Apple Shippers' Association, twentieth annual convention and apple exhibit, Copley-Plaza Hotel, Boston, Mass., August 5, 6, 7.

Thirty-ninth Annual Convention of the American Poultry Association, to be held at Chicago, Ill., August 8th to 15th, 1914, inclusive.

National Dairy Show, Chicago, Ill., October 22–31. The following meetings and conventions will be held in connection with the show: American Association Creamery Butter Manufacturers, Oct. 26. Holstein-Friesian Association of America, Oct. 26. International Milk Dealers' Association, Oct. 26 and 27. Conference, Secretaries of State Dairymen's Association, Oct. 27. Official Dairy Instructors' Association, Oct. 27. National Dairy Union, Oct. 28. American Dairy Farmers' Association, Oct. 28. Council of the National Dairy Show, Oct. 28. National Association of Creamery Managers and Owners, Oct. 28. American Jersey Cattle Club, Oct. 28. National Association of Ice Cream Manufacturers, Oct. 28, 29 and 30. International Association of Dairy and Milk Inspectors, Oct. 29. American Guernsey Cattle Club, Oct. 29. Congress of Marketing, Oct. 29. Milk Producers' Association, Oct. 30.

Annual Show of the Paterson, N. J., Poultry, Pigeon and Pet Stock Association, November 18–21.

Indiana Apple Show, Tomlinson Hall, Indianapolis, Ind., November 18–24.

"WOULD George enlist?" "No, I don't think he would." "What's the reason. He comes of fighting stock." "That's the reason. He's soured on fighting. His grandmother is a Colonial Dame, his aunt is a D. A. R., and his mother is a militant."—Boston Globe.

A YOUNG lady took down the receiver and discovered that the telephone was in use. "I just put on a pan of beans for dinner," she heard one woman complacently informing another. She hung up the receiver and waited. Three times she waited, and then, exasperated, she broke into the conversation. "Madam, I smell your beans burning," she announced crisply. A horrified scream greeted the remark, and the young lady was able to put in her call.—Christian Endeavor World.

Deyo Portable Engine

IT'S ALWAYS READY

No time wasted tinkering the thing to make it go, and then taking it to pieces trying to find out why it doesn't run regularly. The "Deyo" runs like a clock—evenly, regularly, continuously. Just keep it supplied with gasoline and oil and it will do the biggest day's work at the least cost. You can't afford to farm without a Deyo Engine. Write for our free booklets that prove it.

DEYO-MACEY SALES COMPANY
24 Washington St., Binghamton, N. Y.

Also Moneymaker Silo Fillers, Pumping Outfits, Pneumatic Water Systems, Feed Grinders, Saws, Pulleys, Belting, Shafting, etc. Write NOW for printed matter and information.

How Big Is Your $ Dollar?

Think it over. Figure it out. Compare it with my direct from factory to farm one-profit plan and you will know why your dollar spent with Galloway is larger and brings you more and how I can save the farmers of America over a million dollars every year.

Galloway Makes $$$ Grow

Even if you have no ready cash, you don't want to borrow. You can buy from me on credit at direct from factory to farm prices and get the biggest dollar's worth you ever had.

5 New Selling Plans--Cash or Credit

Here they are. Take your choice. 1--Cash with order. 2--Bank deposit. 3--Part cash, part notes. 4--All notes. 5--Monthly payments. One of these will please you and suit your pocket book.

5 H. P. Engine $99.50. Write for Catalog

It's the best engine for the money on the market. Sold on 30, 60 or 90 days' trial. Send for catalog and find out all about this great Galloway bargain.

WHAT WOULD YOU DO?

[Here are more comments on the case recently reported by Mr. Cosgrove where the eggs were claimed to be infertile.]

I would find out through his banker or some friend or acquaintance in his town whether or not the complainant was a novice, and whether or not he was telling the truth, or ask him to return the clear eggs. For obvious business reasons I would make him a satisfied customer.

New York. MONTICELLO EGG FARM.

It is odd that an experienced "hen man" like George A. Cosgrove has to ask whether he shall replace egg settings that his customers report not hatching. There should be a contract and lacking that, a settled practice in such matters. I believe that all a dealer in eggs or anything else should be required to do is to affirm that his goods are what they purport to be to the extent of his knowledge and belief, and he takes no further responsibility. Anything like a guaranty should be stated in so many words. However, if his own settings of eggs are found not to hatch he should then make good such of the same lots as he has sold. He is bound to take all reasonable measures to find what the quality is. Eggs have hatched badly in this section this season. The Spring was wet and cold. J. W. C.

Western New York.

If justice is to be done to both seller and buyer the matter should end just where it is. The seller knows about what per cent. of fertility his eggs are running and doubtless can produce witnesses to prove it. The buyer in this case has produced no proof that the eggs were "all infertile." But if he can show any reasonable proof that there were many infertile eggs, or that his hatch was poor it would be good business practice to allow him the benefit of the doubt and replace them on liberal terms. I believe the majority of purchasers are honest, but have known of instances when the claims of purchasers seemed to me unjust, as eggs incubated in large numbers a few days before and a few days later at our plant showed high fertility, while a claim of poor fertility was made for eggs sold in the meantime. I believe eggs should be fresher if shipped, than when incubated at home as the content becomes weaker with age and is liable to injury from jolting. At this farm we find it most satisfactory to guarantee a definite per cent. of fertility, and agree to replace all clear eggs returned within 10 days of shipment. As white eggs may be tested on the third day of incubation this is ample time, but for brown eggs it might be advisable to allow a little longer time.

New York. ERNEST C. BENEDICT.

It would seem that the answer to the questions asked by Mr. Cosgrove might be found in the dictum laid down by a man who was more than ordinarily successful in building up a business, i.e., "The buyer is always right." It will not pay to leave any buyer sore if it can be prevented by any possible means. The reason is, of course, one of policy. Duty need not be considered. In the case cited the buyer should have his money back, or more eggs, as he chooses. The rule should apply even when it is very evident that the buyer is dishonest. He'll boost you some day. G. A. W.

Shawnee, Okla.

I have bought eggs and I have sold them. I once paid $20 to a reputable breeder for 15 eggs and got seven chickens. Another time I paid $30 for 15 eggs that came halfway across the country and didn't get a chick. I sent no complaint in either case. I knew I was taking chances. The eggs were reasonably fertile. A combination of circumstances worked against me. If a poultry breeder advertises to replace infertile eggs free, or in case of a poor hatch duplicate the order at half price, and take the word of the customer, he should do as he agrees. Personally I think that when a breeder knows his stock is vigorous, and that the percentage of infertile eggs is small, he is justified in looking with suspicion at a complaint that all or nearly all the eggs were infertile. The same rules of honor and honesty apply in this as in all lines of business, but I hold that the purchaser assumes more or less risk whenever he sends for eggs. He should ascertain, if possible, the reliability of the party with whom he deals and then be sure that he does his part to insure success.

W. H. HUSE.

In an advertisement of eggs for hatching there is an assurance of the eggs producing chickens implied to the buyer sufficient to induce him to risk his money for the eggs. This implied assurance makes the seller responsible to a certain degree. He can send no eggs but such as of which, from proper production and test of similar eggs, he has good evidence that they are fertile. The sale also creates the relation of buyer and seller with its mutual rights. The seller, however, cannot be made responsible for the results of incubation in the hands of the buyer. Wrong conditions during hatching arising either from carelessness or lack of knowledge may destroy the fertility of the eggs. True, the seller's eggs should be tested at the end of a week's incubation, and the result reported to him. But the buyer may be a farmer. His crops—the main income—rush him daily, his mind is absorbed by these; or it may be his first experience in hatching eggs purchased from breeders and he naturally supposes from the advertisement that every egg will hatch, so that he gives them no further thought after setting them until on the twenty-first day he looks for his chickens. The seller should allow for these things and in order to "bear one another's burdens," in case of a just complaint, should replace the eggs at half price or half the eggs free of charge, and if the season of full rates is over, at half the reduced rates. This is the law of humanity.

This is where the buyer is an honest man and his complaint true and just. But there are many dishonest persons in the country, some among all classes of people, some who will report "None hatched; all infertile," when they had a full hatch, in order to obtain more eggs for nothing. The dealer cannot make good reported failures without investigation. Therefore let G. A. C. investigate his case. If the buyer is a reliable, honest man, he has standing in his community and will be glad to furnish references. Send to him for a reference of his standing from his pastor (he should be a member of some church) his banker, postmaster and groceryman. If these testify to his honesty and veracity his complaint is true. He failed somewhere in the hatching although the eggs were fertile. But after paying out his money for the eggs we may reasonably suppose he did the best he could to hatch them. Share his loss half and half. It is right and good to be generous. If he refuses to furnish reference he is a fraud.

Illinois. J. C. S.

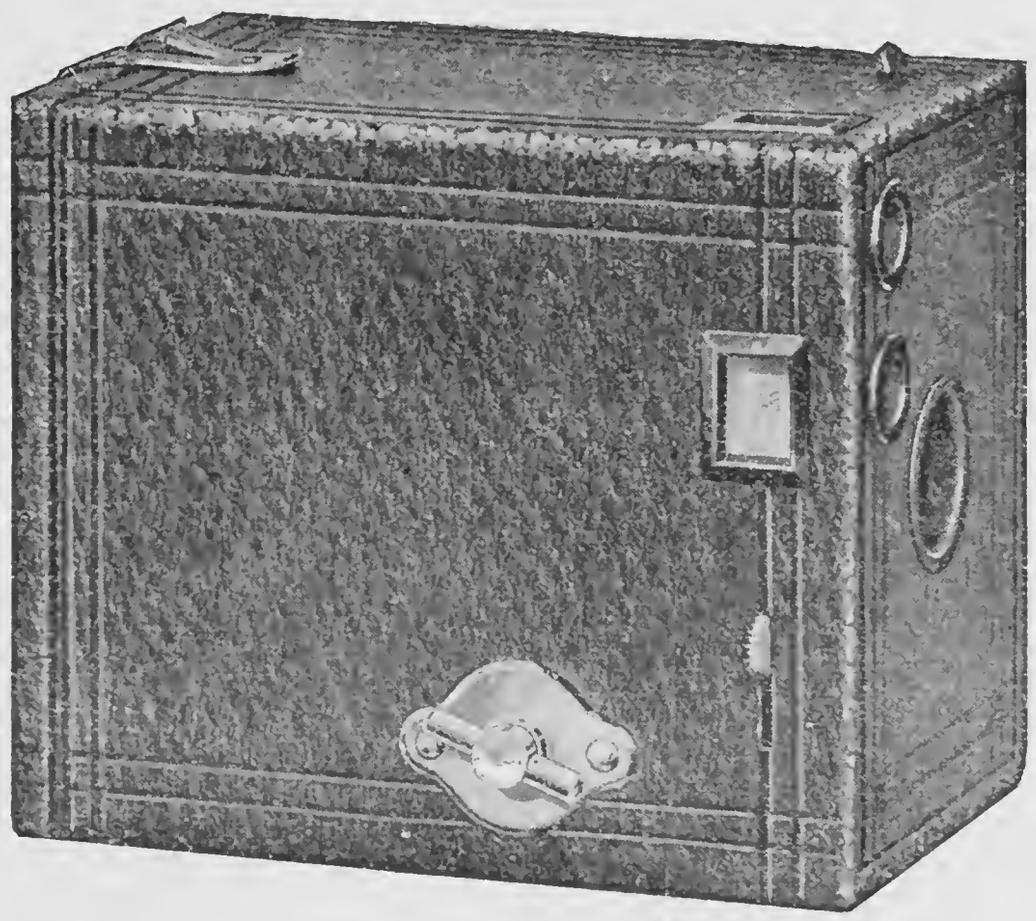
What Causes Crippled Chicks.

WILL you please let me know just how much influence the air in the incubator has upon the hatch? The hatch which I had a week ago was about 72 per cent. of the eggs set, and what I would expect this time of year. My hatch this week, however, was but 55 per cent. of the eggs set. Further, we had more cripples than at any previous time. As far as I can tell the only condition that differed from previous ones was the atmosphere of the cellar itself. We did not have as much air as there has been at other times. While the windows were open as far as they had been previously, it was enough warmer out of doors to make it rather "close" in the cellar. Can you tell me whether this would cause the difference in the two hatches, or can you offer any other explanation? C. W. H.

Homer, N. Y.

Regarding the crippling of the chicks, would say that in our experiment station work we have found the cellar air has comparatively no effect upon incubation. This air, with the exception possibly of the danger of the fumes from the kerosene oil, which may be vaporized by allowing too much kerosene oil on the lamps after filling, or the possibility of the proximity of the can or the spilling of the kerosene on the floor of the incubator cellar, has no effect on incubation. We are not altogether sure that the vaporized kerosene oil does not have some effect upon the development of the chicks. We are working on this problem at the present time. Otherwise the air is not of any importance, as the carbon dioxide in it is the chief factor and this never exceeds an amount that would be serious to incubation. I judge the trouble that this inquirer has had is one of temperature, for most of the crippling is caused by that factor and this is most likely to occur during the first five days of incubation. During these first five days the primordial cells, or the basement cells that go to form the tissues of the chick, are laid down during this time. Any excess temperature or any abnormal temperature at this time will multiply the number of these cells, and cause cripples more often than at any other period. I should suggest that C.W.H. have several thermometers in different parts of the incubator, to test out whether or not one part of her incubator was much hotter than the others; to see to it also that her incubator was level. With all types of incubators we strive to get at the factor that causes a certain condition, but it is difficult to identify the identical thing that does the damage. We all know that when we catch cold we are likely to remember we were sitting at a window some particular time, and usually connect a cold and the draught as the cause and effect, but I imagine a great many times we lose the real cause and lay it up to something that we guess, so with incubation, there is a danger with just that sort of thing. It is well to remember that the first five days of incubation are more dangerous than any other period during the hatch, and for that reason temperatures need to be watched very carefully during this time. E. H. LAMSON, JR.

Storrs Exp. Station, Conn.



The little camera that does big things.

Price, $1.25

No. 0 Brownie

MADE by Kodak workmen in the Kodak factories, it is accurate, reliable, efficient. So simple that anybody can make good pictures from the very start and is economical to operate, the film cartridges for eight exposures costing but twenty cents.

The No. 0 Brownie has an automatic shutter for snap-shots and time exposures, a carefully tested meniscus lens, and has two view finders, one for vertical and one for horizontal exposures. The pictures are 1⅝ x 2½ inches, the same size as those made by the famous Vest Pocket Kodak. Like all the Brownies it loads and unloads in daylight with Kodak film cartridges. You can do your own developing and printing (without a dark room if you like) or your dealer will do it, or have it done for you.

With each camera we give without any extra charge a complete manual of instructions and a year's free subscription to our monthly photographic publication "Kodakery"—a beautifully printed and delightfully illustrated 32 page magazine that is full of helpful hints to the amateur photographer. You can take good pictures. It is part of the Kodak service to help everyone of its customers to successful results.

Ask your dealer to show you the No. 0 Brownie or write us for catalogue of Kodaks and Brownies.

EASTMAN KODAK CO., ROCHESTER, N. Y., *The Kodak City.*

Hope Farm Notes

PART I.

A PATCHWORK DAY.—I went to bed Friday night determined to have one day as a purely theoretical farmer. I was to plant potatoes on June 28, against general advice and on a theory of my own. Why is it not a good thing sometimes for a man to kick over the traces, reject all advice and try his own way? When I awoke Saturday I knew one of those patchwork days had come—when you cannot do anything as you would like. The sky was dull and grey and full of tears. We had about two tons of hay as the mower left it on the ground and had planned to keep on cutting through the forenoon. How were we to know that Nature would cry when we wanted her to smile? First thing of all was ammunition, and that we got in a good bowl of oatmeal and milk, a R. I. Red egg and coffee. Then we went out to plan the day's patchwork.

PLENTY OF WORK.—The Italian army marched in early, for we had hired them by the day. Merrill had the cows in the pasture and the horses were ready. There was that hay on the ground, 20 acres of corn that might well taste the weeder, bugs getting at the potatoes, two acres of strawberries needing hoeing, the seedling asparagus plants alive with weeds, peas to be picked and the 'phone sounding with orders for strawberries. The sky broke loose into one of those mean, dripping showers, which make cultivating and hoeing just plain transplanting of weeds. As an opening skirmish Merrill led the Italians into the strawberry patch. We began picking Marshalls on June 1. After four weeks there were still big red berries in that four-year-old field. The vines are thick and high, and the weeds have come in so that the shower made it seem like a wet sponge. I kept out, but the Italians proved to be good swimmers, and the heaping boxes of red fruit soon began to show under the packing tree. Almost before we knew it the rain stopped and the sun popped out bright and clear. At the house the children were busy preparing vegetables for dinner, while Mother was organizing her forces for a job at canning strawberries.

PLOWING OLD FRIENDS.—That five-year-old patch was doomed. The vines were thick and strong and it was full of sorrel, but there was no use carrying it another year. It gave us the earliest fruit this year. On Friday two of a neighbor's boys gleaned a crate out of it, but the time had come to put our old friend under ground. So Philip hitched Tom and Broker to the plow and began working round and round the field. Tom and Broker are two gentlemen from Virginia, gray in color and great in weight and power. Hauling the big plow is usually play for them, but on this sultry day and in this solid field they found a full horse's job. The roots of a five-year strawberry field grab the plow about like Alfalfa roots, and the entire soil is stuffed with humus. To begin with, we plowed under a heavy growth of rye and clover, and year by year the cream of the farm has been going back for mulching. Little comes out, for 1,000 quarts of berries will take away less than three pounds of nitrogen, one pound of phosphoric acid and four pounds of potash. Everything else, including the vines and old roots, goes back to the soil. So, after five years, an old strawberry bed will be the richest and soundest spot on the farm. Philip put the plow down to the limit, and as Tom and Broker tumbled the fat furrows over they wondered who told them that strawberry culture was a soft job, and this was where I had my eye on potato culture.

"FRIENDSHIP."—There was a chance for an essay on friendship as we watched that old berry field turn upside down. These old veteran plants might well have bewailed the fate which turned them out of a bright and beautiful world in their old age, just because they needed more care than these young sprouts growing beside them. Had they not for years stood up and delivered the big berries on call? What friendship was this which cut them out right when they wanted to show what old folks can do when they try? Of course I could tell them what great things they were to do with my potato crop, but like the rest of the old timers these plants lacked faith in my new theory. Anyway, who remembers the dead? The potatoes might do wonders, but who would give any credit to these strawberry plants for growing potatoes? You see friendship has its sharp angles and teeth. I was reminded of this by a soft brush against my leg, and there was the Airedale terrier as usual at my heel, ready for business. This little dog has appointed herself a special protector for the Hope Farm man. She knows he does not hear well, and does not intend that any insurgent shall slip one over him. In several cases strangers have come to see me. When she sees me walking off over the farm with them the little Airedale drops everything else and follows like a shadow. In several cases these men have become interested in some discussion and taken hold of my arm in order to make me hear. In a flash, unless I can think to stop her with a word, the Airedale is upon them. It is somewhat embarrassing to have such friends. Shakespeare compared a "thankless child" to a serpent's tooth. Little Airedale's teeth are just as sharp, and she may produce "thankless friends." But here comes another shower. Philip and Merrill and the Italians are waterproof but the Hope Farm man is better under shelter. So it is "me for the house" with my faithful friend close at hand. She stands in the barnyard to see me safely across the lawn, and then lies under the shed with her watchful eye open.

A FRUIT TRADE.—On the cool front porch Mother and the girls look like the sanguinary picture of Liberty killing a whole batch of tyrants. Their hands and arms are red with strawberry juice and one might find a smear or two on their faces. They are cutting and trimming the fruit for the kettle which is bubbling on the kitchen stove. We must keep up our reputation for being able to pick Marshall berries every day in the year, and the girls want to enjoy a few college spreads next Winter—of bread or crackers and Hope Farm preserves. Some people seem to can the fruit which cannot be sold, but our folks want the best, and they trim and cut out every speck or hard place. But here is the sun once more, and though there is no wind the sky looks like the face of a child that has had its cry out. We picked off about 125 quarts of berries. There might have been two crates more, but with fair weather they will go until Monday to fill some orders. It is not a wise plan to stock up too heavily with berries on Saturday afternoon. So we vacate the berry field and hold a little council of war. No use touching that hay on the ground or cutting more down. No use cultivating. You would just dig a weed at one place and stick it in somewhere else. Much the same with hoeing in the beet field. There are three safe jobs until that strawberry field is ready—potting strawberry plants, cutting weeds and grass with a scythe, and cleaning out the asparagus seedlings. On the whole this latter promises most, so the Italians go down on their knees and finger out the weeds, while Merrill runs the scuffle hoe. I take the Redheads and go to picking peas to be sold on the wagon this afternoon. I would like to try an experiment with the weeder on the hill cornfield, but Bob will be needed for the wagon. Here comes another sprinkle, but the sharp-eared Redheads have heard the call for dinner, and here comes Philip down the lane with the big gray horses.

DINNER.—A combination of Saturday and canning day prompts the housewife to put up odds and ends for dinner. Under the shed the Italians munched their bread and cheese and onion. Tom and Broker recruited on hay and grain, and the little Airedale planted herself in sight of the kitchen door. When I took up my knife to carve I found the cold, fat remains of a ham bone. It required a mighty struggle to find any lean meat on this remnant, but that was no killing matter with an abundance of string beans, creamed potatoes, whole wheat bread and butter and about five quarts of big Marshall strawberries. As I figured it this made 79 meals since the berries began, and I think we have had them on the table at each meal. The ham bone was cleaned up, and there was nothing but a stain at the bottom of the berry dish when the Hope Farm family started for the afternoon campaign. The kitchen, in fact the entire house, was filled with the fragrance of cooking berries. "No water! No water!" It was a chorus from the women folks, for the tank had gone dry and the willing windmill had been deserted by his friend Mr. Breeze. A dry tank is a nuisance with a kitchen full of work and a squad of children coming on later for their bath. So Merrill got out the belt, rigged up the pumping jack and started the sprayer engine. It was remarkable how the gasoline hired man reached out his strong arm in aid of his friend the windmill. The cold water soon began pouring into the tank. Old Bob stepped into the wagon shafts and the boys drove off to sell their strawberries and peas. Philip and the grays went back to plowing, and I started cutting potato seed with the two little redheaded girls to "help."

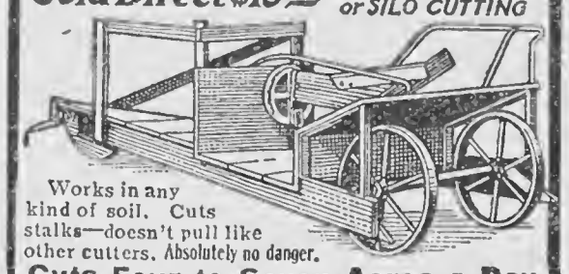
PEDIGREED ASPARAGUS.—I can see the Italians down on their knees fingering out the "pusley" and red-root from the delicate little plants of asparagus. These weeds are all put into piles by the side of the patch and will be hauled to the hill and piled around the apple trees. As I cut my potato seed I try to guess what trap-nesting freak of history has sent these descendents of the old Romans down on their knees in my asparagus patch. Tom Barron tells us that the constant use of the trap-nest in his flock has developed a certain type or character of hens. Reputation would not do it, but performance did. Every Italian who comes to this country may carry the reputation of tracing back to the old Roman legions, but the trap-nest of life and work puts him in place. Yet these men may not realize it, but in working with this asparagus they are dealing with about the best pedigreed thing in New Jersey. This patch of Reading Giant has royal breeding for resisting rust. It will seem strange to many of us—this idea of breeding asparagus as we would breed prize animals, but it has been done. Out of something like a quarter of a million seedlings the experts found one strong male plant which *would not* rust. Then out of another great lot they found a rustless female plant. From these, what I call a royal strain of immune asparagus has been started. In my little patch are some 16,000 of these royal plants—better bred than anything else on the farm except it may be my little Airedale friend. No wonder we give this patch first choice for labor. It is worth the attention of any Roman army that ever cleaned out a province and scattered salt over the crops. Salt would not hurt the asparagus, but it would keep the weeds down. I could give some figures about the financial possibilities of this asparagus which would class me as a manufacturer of big stories.

POTATO PLANTING.—But here comes Philip with bad news. The plow has broken. I know not whether those tough old berry roots combined for a desperate effort, or whether they enlisted the sympathies of an apple tree root, but at any rate Tom and Broker put all their meat against some obstruction, and the plow handles smashed. There we were with a narrow strip of unplowed strawberry bed laughing at us, and no plow large enough to rip it over. Having started to plant potatoes I decided to do so on what had already been plowed. So Philip switched over to the Acme harrow and started to fit what he had plowed. Nine times out of ten I should have used the cutaway first and thus torn up the upper five inches of the field—then used the Acme to fit the surface. That is the plan for early planting, but the middle of Summer is unseasonable planting at best, and I wanted unseasonable preparation. The soil is moist and open, and my theory was to disturb it as little as possible after plowing—just smooth the surface over and put the potato seed right down into the undisturbed furrows. Right there among the vines and weeds I figure that the seed piece will have a better chance to make stem and roots during the hot dry days which are coming, and which make an end of our early planted crop. I might have used the planter or dug out furrows with the shovel plow, but I wanted to try out my theory about late-planted potatoes. Corn or cabbage would have been safer and we expected to plant out celery on this field, but instead of these we planted a theory.

H. W. C.

The PERFECT CORN HARVESTER

Sold Direct $19.50 JUST the THING for SHOCK or SILO CUTTING



Works in any kind of soil. Cuts stalks—doesn't pull like other cutters. Absolutely no danger.

Cuts Four to Seven Acres a Day

with one man and one horse. Here is what one farmer says: Leraysville, Pa., Nov. 18, 1913.

Gentlemen:—Your Corn Harvester was very satisfactory. I cut 3½ acres after 9 A.M. of Silo Corn, averaging 10-ft. tall and rowed one way. Much admired by neighbors. Yours, A. E. JOHNSON.

SOLD DIRECT TO THE FARMER

Send for booklet and circulars telling all about this labor-saving machine; also containing testimonials of many users. Send for this circular matter today.

LOVE MANUFACTURING COMPANY
Dept. 3 Lincoln, Illinois

Make Your Own Concrete *Save $5 to $10 Per Day*

Requires only a 2 H.P. Engine

Drum 36 in. Dumps Clean Full Length

Weighs Only 400 lbs.

Champion Power Batch Mixer

is a big money maker on the farm, for laying barn floors and curbs, walks, fence posts, silo blocks, etc. Will mix more than one-third cubic yard at a batch. Can be used as feed mixer when desired. Strongly built; repair proof, will do steady, hard work for years.

Price Only $35 Guaranteed to satisfy you or money refunded. Special price when mounted on truck with engine attached. We make also a hand mixer of same pattern at lower price.

Shipment from warehouse stock:
Albany, N.Y.; Cincinnati, Ohio or Factory.

E. Frank Coe Fertilizers

1857 THE BUSINESS FARMERS' STANDARD FOR OVER FIFTY-FIVE YEARS 1914

Your Crops Are 100% Important to You!

Will It Pay You to Feed Them Abundantly?

During the past 60 years Europe has doubled its average yield per acre of farm crops.

50 per cent. of this increase is due to the generous use of commercial fertilizers; 25 per cent. to better preparation of the soil; 15 per cent. to better seeds; and 10 per cent. to better crop rotation.

That the same and greater increases may be obtained in this country is shown by the following comparisons:

PENNSYLVANIA.—As an average of 24 years the wheat yields at Pennsylvania State College, when grown in a four-year rotation, varied as follows:

Unfertilized Land produced..... 10.1 bu. per acre
Farm Manure produced.....24.1 bu. per acre
Commercial Plant Food produced.....24.8 bu. per acre

OHIO.—An average of the wheat yield for 19 years at the Ohio Experiment Station (the wheat being grown in a five-year rotation with clover, Timothy, corn and oats on five different series of plots, so that every crop might be represented every year), shows:

Unfertilized Land produced.....10.2 bu. per acre
Farm Manure produced.....21.7 bu. per acre
Commercial Plant Food produced.....26.9 bu. per acre

NEW ENGLAND (a section of this country commonly spoken of as having an "exhausted soil"), is producing an average of 177 bushels of potatoes per acre. Maine averages 210 bushels, and Aroostook County, Maine (a county as large as the entire State of Massachusetts), averages 300 bushels; while yields of 450 to 500 bushels are by no means unusual.

These yields are startling when we realize that the great middle Western States are producing an average of only 92 bushels of potatoes per acre, and that Ohio, with its naturally rich soil averages only 75 bushels. The difference is due to the generous use of high grade commercial fertilizers.

Wherever plant food is used in a business-like way E. FRANK COE FERTILIZERS are the recognized standard.

For 57 years they have been building farm homes, paying off mortgages, and establishing a permanent and profitable agriculture.

Can you afford to omit the use of these superior plant foods for your Fall seeding to Wheat, Rye, and Grass or your mid-summer seeding to Alfalfa?

If you have not yet learned the details of our prize contest for photographs of farm crops, you should write for them today.

THE COE-MORTIMER COMPANY, 51 Chambers St., New York City

Ruralisms

Removing Spring Bulbs.

HOW soon should I dig up bulbs of hyacinth, tulip, etc., so that I can put other plants in their place?
Fulton, N. Y. P. G.

If the bulbs are to be used again they should remain until the leaves turn yellow and die down, showing that the bulb is ripened. It is during this period that the bulb is gathering, through roots and leaves, materials for the next season's bloom. If, however, it is necessary to remove the bulbs before they are ripe, for the purpose of setting bedding plants, lift them carefully with a spade, disturbing both roots and leaves as little as possible, and then heel them in, in a shallow trench, in some half-shaded out-of-the-way place. When the leaves have withered lift the bulbs, let them dry in the shade out of doors, and then store in a cool, dark airy place, putting them in baskets or slatted trays, so that air can circulate freely. We make a practice of using these bulbs in herbaceous borders, where they are permanent, being moved about once in three years; their companions, such as pinks, Phlox, columbines, rose campions, etc., come on after the bulbs, interfering with them very little and filling up the spaces after the bulbs die down. Another labor-saving method is to sow Summer annuals among the bulbs, such as Petunias, marigolds, Drummond's Phlox, etc., these occupying space as the bulbs die down, but where bedding plants are used the bulbs must, naturally, be lifted each year after flowering, and this plan is certainly desirable in controlling weeds and keeping the soil in good condition. The various sorts of Narcissi, however, should be left in the ground; we transplant seedling annuals among them from a nursery bed as they die down.

Gooseberries.

I HAVE been growing gooseberries for 50 years, aiming always to have the best. The advent of Houghton's Seedling was hailed as a great acquisition and this is still a useful variety. Then came Elliott's Pale Red, an English variety, so much like Houghton as to fail to obtain a permanent place. Then Downing, an improvement in Houghton in size, but not its equal in productiveness. Then a line of English varieties of fine size, but of little valu in America except to be exploited by the smooth-tongued agent. Later came Pearl, from Canada. If this is not identical with Downing it is so near like it as to be of no greater value. Early Orange is of Houghton type, a little larger, yellowish in color and decidedly earlier. Mountain Seedling, sent out by the Shakers of Mt. Lebanon, N. Y., is an extra strong upright grower, giving a few fruits an inch in diameter, but more one-third to one-half inch; in general not productive.

Fifteen years ago I obtained Champion, a variety originating in Oregon I find this the most satisfactory of any variety I have seen The plant, of the Houghton type, is a strong tall grower, and the fruits about one-half inch in diameter, hanging in ropes, so you can strip off a handful at a grab. The fruit has an unusually thin skin, nice on this account for culinary uses. E. Y. T.

Brazilian Forage Grasses.

BULLETIN No. 94, issued by the Office of Foreign Seed and Plant Introduction, Bureau of Plant Industry, gives some interesting facts about forage plants in Brazil. The picture shown at Fig. 376 is reproduced from this bulletin. It shows a load of grass being carried into the town of Bom Fim from the adjacent valley where it is grown. In the State of Bahia Angola grass, or capim de Angola, as it is known in Portuguese, is one of the commonest and most highly esteemed forage crops. It is fed to both horses and cattle. While generally grown on low wet grounds near the coast, in the interior it is often seen on comparatively dry land. The bulletin also gives an interesting picture of the process of planting capim de Angola on the municipal farm at Bahia, Brazil. This is an especially wet piece of ground; instead of planting in the ordinary manner the soil is stirred up with hoes and the grass, after being scattered over the surface, is tramped in with the feet. Ditches are required to drain off the surface water, which accumulates rapidly. Ten days from planting the field is in active growth. This Angola grass is a Panicum, the family to which our familiar Barnyard grass belongs.

A LOAD OF ANGOLA GRASS. FIG. 376.

Another of the principal forage plants is jaragua grass, Andropogon rufus. It is a perennial grass growing to a height of six feet or more when not cut promptly, and said to be resistant to cold and prolonged rains. Another grass called Capim catingueiro, botanically Chloris elegans, is being tested, though described as rare; it is adapted to semi-arid regions, and is believed to be high in food value.

Asparagus, Salt and Chicks.

I HAVE over an acre of asparagus that I am cutting. I would like to put some salt on it to help kill the weeds and benefit the asparagus. I have young chicks running out on the field and am afraid that if I use the salt they will pick it up and cause their death. Would you advise me to use the salt as a top-dressing or to put it on and turn the soil over it, or would I best wait until the cutting season is over and the chicks removed before using salt? About how much is it advisable to use per acre? Can you give me any idea as to the average amount a thousand roots will cut at the age of six or eight years, and about what the average price per pound is for the season? G. S. T.
Westerly, R. I.

It is possible to give chickens enough salt in the feed to kill them, but I have never known of one voluntarily to eat enough salt to do it any harm. Chickens, like every other animal, will eat salt if they can get it, but are quickly and easily satisfied and will not eat more than is good for them, unless it is mixed with mash or some other soft feed; then there is a possibility of them eating too much. Apply this salt to the asparagus after you are through cutting; 700 to 800 pounds of coarse table salt to the acre will be sufficient. Spread broadcast as evenly as possible, and in a week or 10 days after applying, plow or cultivate the patch.

The number of bunches or pounds a six or seven-year-old patch of any number of plants will produce, depends much on the variety, the kind of soil, the fertilizing and cultivation they receive. When all things are favorable, 2,000 to 3,000 bunches weighing 2½ to three pounds each is considered a good yield. Most growers are well satisfied with 2,000 bunches per acre, which is the average yield, and consider the yield extra good when the number of bunches yielded goes much over the 2,000 mark. The price varies much according to the quality, the season and the condition of the market. Most growers grade the sprouts into three sizes, extra fancy primes and culls. At the opening of the season the price, of course, is much better than later on when the supply is more plentiful. In most markets the price averages about $2.50 per dozen bunches for extra fancy, $1.50 per dozen for primes and $1 per dozen for culls. K.

New Plant Introductions.

THE R. N.-Y. has already referred to the udo, a Japanese vegetable used like celery. It is, botanically, Aralia cordata. Bulletin 94 of the Office of Foreign Seed and Plant Introduction states that the Department of Agriculture has secured 10 of the best udo varieties from Japan, for purposes of comparison and selection. They will be distributed later.

Some Italian squashes received from a Californian collaborator are thus described: "Zucchetta nana 'Cerbero' and 'Romana.' Peculiar kinds of squashes. These squashes are eaten green, and while the flower is yet adherent to the fruit, and never when the fruit is ripe, at least I have never seen it eaten at that stage. Used stewed, fried, etc., in many different ways, like squash or green peas. It is most delicious when boiled in fresh butter and is fully equal to any other fresh vegetable in this country. Many eat the flowers when the fruit is between six to ten inches, always while green."

From Tientsin, China, come seeds of the Bonavist bean, a variety of Dolichos Lablab, thus described: "The common name is 'old woman's ear' and it is a specialty of the north. The ripe beans can be used like any other bean, but are generally used in the pod like string beans. As it grows readily and likes the cold weather, just so that it does not actually freeze the blossoms, it thus provides a green bean when the other string beans are gone. In cooking it the object is not to make it soft but just to plunge it into boiling hot water and not much more than seald it, so that it still remains crisp enough for a salad, then it is dressed with vinegar and oil. It should be grown on a trellis. The pods when full grown measure from four to six inches long and about a couple of inches across, but people generally do not wait until they are full grown, but begin to eat them when young so that the whole pod can be used."

Another bean from Tientsin is also described in Bulletin 94: "Lu to. This makes a better quality of starch than anything else. It is curious that in China the starch obtained from maize or wheat is not valued as much as that made of this bean for laundry purposes. They also make a vermicelli from the starch of this bean, and one can at once distinguish it from that made from ordinary starch by the fact that it keeps its clearness and shape much better no matter how much it is boiled. It also has a better flavor and good keeping qualities. Perhaps it might be an addition to the laundry starches of America, as I fancy it would take a much better gloss, as it is harder than ordinary starch and would not need so much paraffin added to make a gloss. I doubt if the American palate would care for the vermicelli, as it is clear like glass and the long strings are most terribly slippery to eat, worse than the round Italian spaghetti."

USEFUL COLLEGE STUDENTS.—Recent articles in THE R. N.-Y. mention experience with working students in no flattering terms. There is much difference in the character of such as are turned out from the agricultural schools; too many imagine that a four years' course in theory fits them for practical farm work, or else look for soft snaps to engage as experts and specialists, of which there is a surplus. On Fairview Farm we are fortunate in having one employed whose conceit has not reached that degree of importance, but is getting practical knowledge in diversified farming, where fruit, berries, dairying, poultry, bees, truck and general farm crops are produced and marketed. He is ready and willing to perform any sort of labor and learning the use of machinery, care of stock and performing all the duties devolving upon practical agriculture. That this young man will be successful if he follows the occupation laid out for himself is not doubted, with his inclination to learn the ups and downs of farm life. W. H. STOUT.

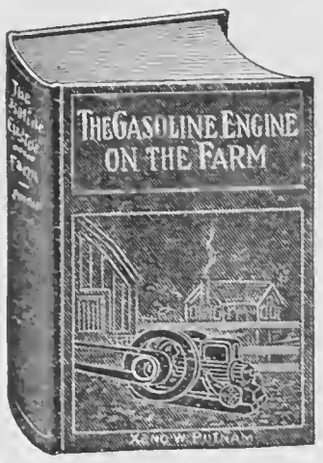
THE GASOLINE ENGINE ON THE FARM. Its operation, repair and uses. By Xeno W. Putnam.



This is the kind of a book every farmer will appreciate and every farm home ought to have. Includes selecting the most suitable engine for farm work, its most convenient and efficient installation, with chapters on troubles, their remedies, and how to avoid them. The care and management of the farm tractor in plowing, harrowing, harvesting and road grading are fully covered; also plain directions are given for handling the tractor on the road. 530 pages. Nearly 180 engravings.

This book will be sent to any address prepaid for

SUBSCRIPTION: ONE DOLLAR A YEAR

To foreign countries in the Universal Postal Union, $2.01, equal to 8s. 6d., or 8½ marks, or 10½ francs. Remit in money order, express order, personal check or bank draft.

Entered at New York Post Office as Second Class Matter.

Advertising rates, 60 cents per agate line—7 words. References required for advertisers unknown to us; and cash must accompany transient orders.

"A SQUARE DEAL"

We believe that every advertisement in this paper is backed by a responsible person. We use every possible precaution and admit the advertising of reliable houses only. But to make doubly sure, we will make good any loss to paid subscribers sustained by trusting any deliberate swindler, irresponsible advertisers or misleading advertisements in our columns, and any such swindler will be publicly exposed. We are also often called upon to adjust differences or mistakes between our subscribers and honest, responsible houses, whether advertisers or not. We willingly use our good offices to this end, but such cases should not be confused with dishonest transactions. We protect subscribers against rogues, but we will not be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent to us within one month of the time of the transaction, and to identify it, you should mention THE RURAL NEW-YORKER when writing the advertiser.

BY general agreement among practical farmers the Fall is considered the most profitable time for seeding Timothy and Red-top, the two most popular grasses in this latitude. Fall is the *natural* time for such seeding, yet it would often be more convenient to seed in the Spring with oats or barley. Yet probably 80 per cent. of such seeding is done in September. We understand that a number of farmers have made very careful experiments at seeding grass in Spring. Will they tell us the results?

*

A GREAT poultry convention will be held at the Massachusetts Agricultural College at Amherst on July 22, 23 and 24. One of the most practical programmes ever suggested has been prepared. Among other important things D. J. Lambert of Rhode Island will tell how to select the 10 best hens or pullets from a flock of 100. It seems to be the general opinion that if Mr. Lambert cannot select the best hen there is no use asking anyone else to do it. The Business Hen is the coming farm food manufacturer for Massachusetts or New England. A hen convention is the place to learn and unlearn. The latter is hardest. Who likes to pull the tail feathers out of his own theories? Yet that is the way theories are made workable.

THE newspapers have recently printed lively stories about gold discoveries in Arkansas. Some of our people have talked of going to the new "diggings," while others have considered the plan of buying stock in Arkansas gold mines! The U. S. Geological Survey got on the job and took fair samples of ore for examination. Their report states:

Despite the high returns claimed, the gold shown by assay of these official samples in no case exceeds 52 cents a ton, and in most of the samples it is six cents or less. No more than a trace of silver was found in any of the samples. The material as shown by these assays is far from being ore, although it probably represents fairly well the average run of the veins.

Paying your money for stock in six-cent gold is surely buying a gold brick. If you want to dig gold out of the soil why not dig ditches through that wet spot on your own farm?

*

WE have hardly known a season when it was so difficult to obtain reliable facts about the peach crop. Never before in our memory has this crop been so "spotty"—good in one locality and light or poor in a section only a few miles away. The Southern crop has started to come North and here is a characteristic report from J. H. Hale in Georgia:

Just in from the orchard where the black boys and girls are happy chatting as they harvest the most beautiful peaches we have ever produced here, and I can't help wishing you were here to see what can be done in "dry farming." Up to last Friday practically no rain for over three months, yet culture, culture, culture, has kept trees and fruit growing and now that rains have come the crop is maturing in fine shape except about two weeks late. Just now well under way with Waddell and Carman; Hiley will be on next week. Belle of Georgia about July 12, and Elberta July 15 to 18 and run till August 1 this year.

*

WE have been waiting patiently for some one to come forward with proof that those English Wyandottes are cross-bred birds or not true to breed. Thus far there has been no evidence whatever except that these birds do not look like the "standard." Mr. Barron says he has simply selected as breeders the hens which gave best performance in the trap nest. The Wyandotte was originally a "made" breed produced by mixing several breeds together and then breeding to a certain type. The latest theory is that the process of trap-nesting which Mr. Barron has carried through has brought out the best egg-laying strain in the old Wyandotte mixture. But why are these birds not Wyandottes? Suppose you took the Dutch Belted cattle with their peculiar white marking. Through a series of generation you select for breeding the heifers which show the best milk production, paying no attention whatever to the white belt or its location. The chances are that you would have finally an improved dairy cow, but the white belt around her would be changed or spotted with black. Yet she would still be a Dutch Belted cow. Or take Jersey, Guernsey, Ayrshire and Swiss cows and breed for a number of generations, selecting only the best butter producers on both sides without much regard to other considerations. At the end of 10 generations the cows of the four breeds would be much alike except for color. Their general shape and type would be much the same, for no matter what her breed the superior butter making cow has a peculiar and characteristic shape or build. Yet all these cows would still be purebred, since we have not gone outside of their true "breed" to produce them. If these English Wyandottes have been selected and bred for performance why are they not still Wyandottes? This and the problems which we can all see sticking out of it is the big question in this case. Who is to tell us what a Wyandotte really is? Shall we accept his dictum even when we know that a bird of another type is better for our purpose?

*

WE have had high "authorities" say that the tariff on food stuff will have nothing to do with prices. Other "authorities" who rank even higher say tariffs have everything to do with high cost of living. Now what have these wise owls to say to the following from Julius D. Dreha, U. S. Consul at Toronto, Canada?

While Great Britain has to import most of its foodstuffs, Canada has a surplus for exportation, and yet the prices of foodstuffs are cheaper in England than in Ontario. It is asserted on good authority that bread made from Canadian wheat is sold at a lower price in London than in the larger cities of the Dominion. While the removal of the duty increased the exportation of cattle to the United States, it had the effect of raising the price of beef cattle in Ontario, so that the prices in Toronto became about as high as those prevailing in the Buffalo market, and all meats became dearer to housekeepers in Ontario.

Think of growing wheat in Canada, sending it 4,000 miles for grinding and then selling the bread for less than the Canadian people pay! In this country the price of meat has steadily increased. Thus the effect of free trade in Canadian cattle thus far has been to increase prices on both sides of the line. For some 40 years now the "statesmen" have kicked this tariff question about like a football. Now we begin to see what a small thing it really is compared with the 35-cent dollar of the farmer. We do not want more tariff tinkering—we do want a new system of distribution which will give the farmer a fairer share of the consumer's dollar.

*

"Many Men of Many Minds!"

WE may go a century from childhood and still find truth in the old nursery rhyme. We find evidence of it here every day. Not long since the following came from a reader who does not want his name printed:

I want to enter a protest against the horse pictures you have been publishing in your paper. White-faced horses are not desirable; a big per cent are soft horses. The Clydesdale colt, pictured recently in THE R. N.-Y., valued at $5,000, is worth about one per cent. of that sum. These big soft horses are many of them worn out at 12 years of age. There is one thing to be said in their favor; their bones are big and they are worth more for fertilizer and knife handles when no longer useful. Were I the editor of THE R. N.-Y. no white-faced horse pictures would be printed. Do not lend your influence in this direction; bar out such pictures along with the fakes not for publication.

We find that what various gentlemen would do if they were editor to be among the wonders of the world. We have a brewer who protests at every reference to temperance, and many who want three pages on Prohibition in each issue. At a fruit growers' meeting a well-known farmer cursed the dairy cow and never wanted to hear of her again. On the same day another man said he wanted nothing but cow. One man said his wife disliked THE R. N.-Y. because it contained the picture of a hog. Another woman said the hog had paid the mortgage on her farm. The fact seems to be that if all these would-be editors had their way there would be nothing at all printed in the paper. Our people are generally broad-minded and fair, ready to think and conduct a fair discussion. As for white-faced horses, we have three on the farm that are very satisfactory. Here in New York, out of about 500 colored horses examined, over 400 had a star, a stripe or a full white face. On referring the matter to Dr. Alexander, we received the following:

Since time immemorial white-faced, "bald" or "blazed" horses have been popular in Europe. It is characteristic of the heavy draft stock of Great Britain, founded with blood of the ancient "black horse" of Flanders, and it no doubt is the origin of the "star" or "stripe" and "snip" in horses of other breeds, notably the Percheron. All of the farm work and heavy hauling on the streets, and about the railroad stations and docks of England and Scotland, and most of the work of the same sort in Canada, is done by grand draft horses of this origin. The accusation of your correspondent is unjust, prejudiced and not based upon intimate knowledge of the facts. A few hours upon a street corner in Toronto, Melbourne, Glasgow, Liverpool, London or Dublin would be likely to change his opinions.

*

SOME great stories have been told about the motor-car as a jack of all trades. We hear how it carries the entire family to church, or business or pleasure in sober style, or how, in time of need, it flashes off for the doctor like a tireless race horse. Then it goes into the hayfield and crawls in front of the mower or hay loader, or pushes the load in through the barn door. Then it runs up to the feed grinder or saw or grindstone, kicks up its hind feet and turns the wheel which runs farm machinery. We are doubtful about these "jack of all trade" stunts, but they are constantly being reported. Here is a new one, however—the automobile as an insecticide—from Kansas:

Never in history has there been such a promise of a record-breaking wheat crop as in Kansas this year. Corn is also looking fine, especially as in the last few days good rains have fallen. The army worm, however, has in certain sections proved very destructive, and it remained for a Kansas farmer to devise a new method of killing them. One of his fields was paralleled by a public road and along this road he ran out a furrow or ditch with a plow. Army worms were crossing from one field into the next and dropping into the ditch. He brought out his automobile and kept it constantly running up and down the road, with two of the wheels in the ditch, and in this way millions of worms were killed. The ditch finally became so clogged that in places it had to be cleaned out, when the murderous procedure continued.

Those who have seen a horde of army worms march over a field and attack the crops will appreciate this story.

*

SOME men go to school to Prof. Adversity; others are instructed by Dr. Experience or Mr. Public Opinion. Now comes a new educator who has gathered a large school of "statesmen" and "thinkers." This new comer is the Hon. Bumper Crop, and he is turning some petrified and prejudiced brains inside out in a way that is miraculous! For example, here comes the Hon Sereno E. Payne of New York, author of the Payne tariff law. Mr. Payne is talking to the voters of his district:
